On 8th June 1842 a Treasury minute was issued directing that a letter should be addressed to the Bank of England, "requesting them to give public notice of their readiness to receive gold coin not being of the weight at which such coin is authorised by law to be current, at the rate of £3 : 17 : 10½ per ounce, and to transmit the same, when received, to the Mint, for recoinage." From this date till 14th March 1845, a considerable recoinage of light gold coin was undertaken by the Mint, the coin received from

the Bank of England being of 2,860,282 ozs. in weight, and £11,137,223 in value.

During this recoinage the law that the loss arising from the lightness of the coins was chargeable to the last holder was strictly enforced. Much inconvenience was caused to the public by the endeavours of shopkeepers and others, who had to pay gold coin into their banking accounts in the ordinary course of business, to transfer this loss from their own to their customers' shoulders. Persons with no accurate means of testing the weight of a coin would calculate its value in some rough way, and decline to receive the same, except at a reduction of 6d. or even 1s. from its nominal value, though the actual deficiency in weight did not perhaps justify a deduction of more than half the amount thus estimated.

From 1845 to 1870 the Bank of England received light gold coin from the public at £3 : 17 : 6½ per oz., the deduction of 4d. from the "Mint price" being made to cover the expense of the assay, of melting the coin into bars, and of sending these to the Mint. The mint at that time declined to receive gold for coinage except in bars.

On 1st August 1870 the regulations of the Mint were altered so as to permit it to receive light gold coins, in parcels of not less than £100, for recoinage. The same *weight* of gold was returned to the importer, coined at the rate of £3 : 17 : 10½ per ounce, *free of charge*. The bank, being thus relieved from the necessity of melting worn coin into bars, raised its price for the coins to £3 : 17 : 9 per ounce, or only 1½d. less than the Mint price. The Mint required the importer of light gold coin to give two days' notice, and to wait an indefinite time for the coin to be re-struck and returned. On the other hand the Bank of England paid for the coin on its receipt, and the public, in practice, found it more profitable to accept at once the Bank's slightly lower price, than to incur the uncertainty connected with dealing directly with the Mint. This system remained in force from 1870 to 1889, during which time £21,421,697 in light gold coin was recoined at the Mint, the whole being received through the Bank of England.

In 1889 an Act of Parliament was passed directing the withdrawal of all gold coins issued before the present reign, at the expense of the State (see DEMONETISATION). This was the first time Parliament recognised the duty of the State to relieve the last holder of a light gold coin from the cost of defraying the loss on its withdrawal. This principle was re-affirmed by the Coinage Act, 1891 (54 & 55 Vict. c. 72), which provides that all light gold coins except those fraudulently dealt with shall be exchanged at full nominal value. Section 1 (sub-sect. 3) defines a greater deficiency in weight than three grains per piece as *primâ facie* evidence of illegal treatment.

By 31st December 1904, when this act had been in operation for about thirteen years, a very considerable improvement had been effected in the gold currency circulating in the United Kingdom, which, generally speaking, had been placed in a satisfactory condition. The following amounts of light sovereigns and half-sovereigns had been withdrawn from circulation :—

To 31st December 1904.	Amount withdrawn.	Loss through deficiency of weight.
Sovereigns .	£28,018,000	£290,927
Half-sovereigns	19,082,000	379,037
	£47,100,000	£669,964

Sterling-using Colonies.—Gold Coin. In Cape Colony, Natal, and Fiji, colonies in which the Coinage Act 1870 is in force, the law is the same as in the United Kingdom. No special arrangements exist in the remaining sterling-using colonies for the renewal of the gold coinage. In 1890, however, when pre-Victorian gold coins were demonetised, the Australian branches of the Mint were authorised to exchange such pieces at full nominal value, and there can be little doubt that a similar arrangement would be made in the event of the re-coinage of gold which is now in progress being brought to a close. For the present, it is open to colonists to export light gold coin to this country, for presentation at the Bank of England for exchange.

United Kingdom.—Silver Coin. The silver currency of the United Kingdom consists of token-coins, on the issue of which a profit accrues to the State. On the withdrawal of these coins, therefore, a loss is necessarily incurred. In England and Wales new silver coin is issued to the public, and worn silver coin withdrawn from circulation through the medium of the Bank of England. The Bank of Scotland and the Bank of Ireland perform the same service in Scotland and Ireland respectively.

Sterling-using Colonies.—Silver Coin. Worn silver coin circulating in colonies is collected by the Colonial Governments and shipped to London for exchange at its full nominal value. In addition to the loss on its recoinage, the Home Government bears the expense of the freight of such coin from the various colonies to London.

Loss on withdrawal of worn Silver Coin. The total amount of worn silver coin, from both the United Kingdom and the Colonies, exchanged at the Royal Mint at its full nominal value, the loss on which has been defrayed by the British government, has, from 1861 to 1904 inclusive, been as follows :—

	Worn silver coin.	Loss.
1861-70	£1,131,900	£156,110
1871-80	2,580,090	314,124
1881-90	2,653,522	324,866
1891-1900	3,300,962	337,634
1901	243,075	18,748
1902	409,536	40,179
1903	276,829	23,779
1904	638,857	61,083

Colonies in which sterling currency is not used bear the loss which arises from the wear of the coins in circulation, but at the same time, whatever seignorage accrues on the issue of the

subsidiary pieces is an addition to the colonial revenue.

The imperial bronze coinage, first issued in 1860, is as yet subject to no conditions as to withdrawal from circulation when worn.

LIMIT OF CREDIT. See CREDIT.

LIMITATION, STATUTES OF. "Time is a power the influence of which the human mind cannot resist; what has existed for a long time seems fixed and unchangeable, for the very reason that it has existed so long; it would be a public evil if this belief were allowed to result in disappointment" (Windscheid, *Pandekten*, i. § 101). The principle thus stated by one of the most eminent modern writers on law has been recognised in all countries and at all times. The lapse of time in all legal systems creates rights and extinguishes rights, or at least the power to enforce them. In the earlier Roman law *usucapio*, the acquisition of property by long enjoyment, was distinguished from *praescriptio*, the barring of the remedy for the enforcement of a right in consequence of lapse of time; but the two principles gradually became merged together, though in some systems of law they are still distinguished by different names (*e.g. Ersitzung* and *Verjährung* in German). In England the object of law, as established by the Statutes of Limitations, is not so much to create possessory titles—although this result in most cases is obtained incidentally—as to bar the remedy of persons who, through ignorance or neglect, have failed to exercise their rights for a considerable period. The length of the period depends on the subject matter of the right. The right to recover chattels, rights arising under simple contracts, and rights to claim damages for wrongful actions, are, as a general rule, all barred after the lapse of six years, but damages for assault and other similar torts cannot be recovered after the lapse of four years, and a person slandered by spoken words loses his remedy if he allows two years to elapse without making use of his remedy. Time does not run against infants or lunatics; they may respectively bring their actions within six years after attaining full age or recovering their sanity; absence beyond seas on the part of the plaintiff is no longer a ground for depriving a defendant of his right to rely on the statute, but if the defendant is absent from the United Kingdom the operation of the statute is interrupted. A written acknowledgment of a debt or any payment of principal or interest from which the existence of the debt can be clearly inferred is also sufficient to prevent it from becoming barred (21 Jac. I. c. 16; 19 & 20 Vict. c. 97, §§ 9-15; 4 & 5 Anne, c. 16).

Rights arising under sealed contracts are not barred before the expiration of twenty years, and with respect to these rights there are rules, similar to those mentioned above, as to the interruption of the operation of the statute by acknowledgment or by the fact that the creditor is an infant or a lunatic (3 & 4 Will. IV. c. 42).

The right to recover land must be exercised within twelve years from the time that the right accrues, unless the person entitled is under the disability of infancy or insanity; but even in the event of disability the lapse of thirty years is sufficient to take away the right to recover. It should, however, be pointed out that, even irrespectively of the possibility of disability, a person having been in possession of land for a period exceeding twelve years is not thereby made secure against interruption. If, for instance, a person having a life interest in land purports to sell the fee simple, the purchaser and any subsequent purchaser may be ejected within six years from the time at which the person entitled after the expiration of the life interest becomes entitled in possession. Thus, if the tenant for life is twenty-one at the time of his fraudulent sale, and dies at the age of ninety-one, seventy-five years of undisturbed possession may not suffice to prevent an ejectment (3 & 4 Will. IV. c. 27; 37 & 38 Vict. c. 57).

The statutes of limitation are not applicable to equitable rights, excepting equitable interests in land, but the courts of equity have, except in the cases of trust and fraud, adopted rules analogous to those of the statutes in question. As regards trusts, the former law was that no lapse of time prevented beneficiaries from recovering damages against trustees for breaches of trust,—however innocent, *e.g.* unauthorised investments; but since 1888 trustees, unless they have been guilty of fraud, or appropriated trust property for their own benefit, are entitled to plead lapse of time (Trustee Act, 1888, § 8), and directors of companies, who were formerly held to come under the same rules as trustees in respect of the statutes of limitation, are entitled, as well as trustees proper, to avail themselves of the benefit of this innovation (*re* Land Allotment Company [1894] 1 Chancery 616). There are special rules as to the limitation of proceedings directed against the crown, and of penal actions to which it is unnecessary to refer in detail.

Speaking generally, the statutes of limitation bar the remedy but do not destroy the right, but as regards real property the effect of the lapse of time is a divesting of title or a transference of title to somebody else (see Dawkins *v.* Lord Penrhyn, 4 Appeal Cases, 51).

LIMITED COMPANIES. See JOINT-STOCK COMPANIES.

LIMITED LIABILITY ACTS. See LIABILITY, LIMITED.

LINGUET, SIMON NICOLAS HENRI (1736-

1794), a clever French barrister, historian, and journalist, threw himself into the midst of the political and philosophical controversies of his time, under the impulse of an innate and quarrelsome love of contradiction. Although he took good care to remain quiet during the Reign of Terror, he perished on the scaffold.

Linguet assailed the Physiocrats in his *Réponse aux docteurs modernes . . . avec la réfutation du système des philosophes économistes* (London, 1771). In his pamphlet on bread and corn, *Du Pain et du Blé*, London, 1774, reprinted in 1789 under the title *Du Commerce des Grains, édition augmentée d'une Lettre sur le mérite politique et physique du pain et du blé* (On the corn trade, with a letter on the physical and political properties of bread and corn) he wages war against the consumption of bread, which he calls a slow poison. He was also opposed to the cultivation of potatoes, which might acquire the fearful qualities of corn.

His following works may also be mentioned: *Annales politiques, civiles et littéraires du XVIII^e Siècle*, London, 1777-1792, xix. vols.—*La Dîme Royale avec des réflexions sur la contrebande*, 1764, reprinted under the title of *L'Impôt territorial*, 1787.—*Traité des Canaux navigables*, 1769.—*Réflexions des Six Corps de la Ville de Paris sur la suppression des Jurandes*, 1776 (Reflections of the Six Parisian Corporations on the Abolition of Crafts).

[Cruppi, *Un Avocat-journaliste au XVIII^e Siècle, Linguet*, Paris, 1895.] E. Ca.

The attack on Montesquieu made by Linguet in *La Théorie des lois civiles* (1767), provoked a reply from the abbé Morellet in *La Théorie du paradoxe*, which Linguet, always prepared for controversy, answered in *La Théorie du libelle, ou l'art de calomnier avec fruit*.

LIPS, Alexander (1779-1838), was a professor of political and economic sciences in the university of Marburg, who at the same time superintended the management of his own estate of Marlofstein, where he founded an agricultural school.

Professor Roscher calls him a queer fellow (*ein wunderlicher Kauz*) and in fact, the proposal brought forward in his *Universal Peace* (*der allgemeine Friede*), 1814, to abolish the hitherto military foundation of nobility, and to give it a basis purely according to population, is rather startling; the titles to be conferred were to be in strict proportion to the number of people sustained by each new nobleman. Lips is thus one of the last representatives of the *populationistic* school, which was so powerful in Germany in pre-Malthusian days.

Lips was most active in insisting on the necessity of spreading agricultural education, of breaking up entails, and of abandoning fallows and the three-field system for intensive modes of cultivation and the breeding of cattle.

But his attention was not monopolised by the improvement of cultivation, and although favourable to free trade as a principle, he considers protection to be indispensable to infant industries. In this respect, he is a harbinger of List.

Lips was a copious writer on topics of the day. He published, 1813, a *Staatswissenschaftslehre oder Encyclopädie und Methodologie der Staatswissenschaft*, in which the state is presented as the rightful interpreter of human reason; his main economic work is: *Deutschland's Oekonomie, ein Versuch zur Lösung der Frage, wie kann Deutschland zu lohnendem Ackerbau, blühender Industrie und wirksamem Handel gelangen?* (Germany's economy; an attempt to solve the question how Germany can secure a remunerative agriculture, flourishing manufactures, and an effective trade), 1830.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 992-993.] E. Ca.

LIQUID ASSETS are cash, and such other parts of a banker's assets as can be instantly converted into cash. A banker's assets are generally divided under the following heads:

1. Cash.
2. Money at Call.
3. Government Securities.
4. Bills of Exchange.
5. Loans and Advances.
6. Premises.

Of these the first three are usually reckoned as liquid assets, but cash alone is really liquid, whilst all the others are so in more or less degree. It is necessary to observe, too, that their degrees of fluidity will depend upon the extent to which they might be required to be converted, and the conditions under which the operation would have to be performed. In times of prosperity and confidence, securities of a miscellaneous character can generally be promptly turned into cash, but there are other times when consols alone are saleable. Another consideration arises with regard to "money at call." As an asset in the balance sheet of a single bank it is only second to actual cash, but in the aggregate, as appearing in the accounts of all the banks in a city, it has quite a different character. It is money lent to brokers against bills of exchange and other securities, and each broker relies on his being able to repay his debt to one bank by obtaining an advance from another. Thus the reduction of money at call in the accounts of one bank means the increase of the same item with another. Hence it might be that at a time of panic the liquid character of the whole asset would disappear, and it would be no more liquid than the bills or securities against which it had been lent. Ultimately, the fluidity of these assets depends largely upon the conditions under which legal tender notes are issued. Bills of exchange, though not usually reckoned as liquid, have some advantages of their own in this respect. They really represent floating capital, *i.e.* capital shortly replaceable by the results of its investment, and are therefore always gradually liquidating themselves. R. W. B.

[G. Rae, *The Country Banker*, 1886, and later editions.—R. H. Inglis Palgrave, *Notes on Banking*, 1873.—*Bankers' Magazine*, London, *passim*.]

LIQUIDATED DAMAGES. Where the parties to a contract agree that a fixed sum will be paid as damages for its breach in case a breach occurs. The object of such an arrangement is to secure the due performance of the contract and to avoid the necessity of resorting to a court in case of breach in order to have the amount of damages ascertained. The courts of equity disregarded the arrangement of the parties and introduced a distinction between liquidated damages and penalties. Where the primary intention of the parties was that if the particular act was not done, the fixed sum was payable, such sum was regarded as liquidated damages; but where the primary intention was to secure the doing of some act and the fixed sum was merely the machinery for securing that the act would be done, such sum was then regarded as a penalty, and the court, instead of ordering such sum to be paid, might award a reasonable compensation. The courts of common law did not recognise the distinction, but the result of the 8 & 9 Will. III. c. 2, § 8, was that where the court held the sum fixed to be in the nature of a penalty, the actual damage suffered only could be recovered; but if it was not a penalty, the amount agreed was payable.

[Mayne on *Damages*, London, 1894.—Story's *Equity Jurisprudence*, London, 1892.—White and Tudor's *Leading Cases in Equity*, London, 1895, for a summary of the principles on which the courts proceed in determining whether a fixed sum is a penalty or not.] J. E. C. M.

LIQUIDATION. The term "liquidation" is usually applied to the dissolution or winding up of a company incorporated by Act of Parliament in the manner prescribed by such act. An unincorporated company can be dissolved under the articles prescribed by its deed of settlement or by a court where the business cannot be carried on as intended, and a company incorporated by charter may be dissolved in the manner therein provided. But where a company is incorporated by act of parliament it cannot, without the assent of the legislature, be dissolved at the will of its members; and as a corporation is distinct from the persons composing it, the death or lunacy or bankruptcy of a member does not affect the existence of the body corporate. Acts of parliament were passed from time to time to give courts of bankruptcy jurisdiction over incorporated trading companies and to enable such courts to apply the assets to the payment of debts. Jurisdiction was also given to the Court of Chancery to compel members of a bankrupt company to contribute to the discharge of the company's debts where the assets were insufficient to pay the creditors in full. The drawbacks of these acts were: (1) that notwithstanding the winding up of a company the creditors might take proceedings against any shareholder for the full amount of his debt; (2) the creditors had to proceed against the company in bankruptcy, and frequently there arose a conflict between the courts of equity and of bankruptcy; (3) the shareholders could not initiate proceedings to dissolve the company; and (4) the expense of taking proceedings was very great. Between 1856 and 1858 some of these defects were removed, and at length in 1862 the Companies Act 1862 (25 & 26 Vict. 289) was passed to consolidate and improve the law. Under this act three modes were provided for winding up a company: (1) compulsorily, *i.e.* by the court; (2) voluntarily, *i.e.* by the shareholders without the intervention of the court; and (3) voluntarily but subject to the supervision of the court.

When a company resolves to go into liquidation or is ordered to be wound up, a person is appointed liquidator whose duty it is to collect all the assets, to pay all debts, and to distribute any surplus amongst the shareholders—due provision being made for the payment of all costs. When the affairs of the company are finally wound up, the court makes an order dissolving the company, and notice of this order is given to the registrar of joint stock companies, who makes a minute in his books to the effect that the company is dissolved.

In 1875 an important step was taken by the legislature with the object of assimilating the law of winding up to the law of bankruptcy. The Judicature Act 1875 (38 & 39 Vict. c.77) provided that as far as the rights of secured and unsecured creditors, and as to the debts and liability proveable, and as to the valuation of annuities, etc., the same rules should prevail on winding up as in bankruptcy. In 1890 a further step was taken by the Companies (winding up) Act 1890 (53 & 54 Vict. c. 63), which was passed for the object of introducing into the winding up of companies the same procedure as that which prevailed in bankruptcy, and of subjecting the administrative acts of liquidators to the control of a government department. It was alleged that under the system, which allowed the petitioning creditor to practically nominate the liquidator, the assets were wasted in unnecessary costs whilst the liquidation was unnecessarily prolonged (see Debate in House of Commons, 28 Feb. 1890). Under the act of 1890, the official receiver in bankruptcy is the official liquidator of companies; inquiries are of necessity instituted as regards the manner in which the affairs of the company have been carried on; whilst the board of trade is charged with the duty of seeing that the liquidator faithfully performs his duties.

The effects and the advantages of an official administration in the case of liquidation of companies are discussed in the reports of the board of trade under section 29 of the Companies

(winding up) Act 1890, published in 1893 and 1894, and in the Report, published in 1893, of the Inter-Departmental Committee appointed to inquire into limits of the action of the board of trade as regards the liquidation of companies.

J. E. C. M.

LIQUIDATOR (*a*) PROVISIONAL (*b*) OFFICIAL. (*a*) Previous to 1891 the court at any time after the presentation of a petition for winding up might appoint a provisional liquidator, though it was not usual to do so until the hearing of the petition. The object of the appointment was to protect the assets of the company; the order of appointment always stating what he was to do. Under the Companies Act of 1890 the only person who can now act as provisional liquidator is the official receiver. Upon the making of an order to wind up a company he becomes *ex-officio* provisional liquidator, but may be appointed as such if necessary at any time after the presentation of a petition.

(*b*) When no other person is appointed liquidator in a compulsory winding up, the official receiver becomes liquidator; in a voluntary winding up the shareholders appoint their own liquidator. A liquidator acts subject to the control of the committee of inspection, of the shareholders, and of the board of trade and of the court. With the consent of the committee he can carry on the business of the company and bring or defend actions, and compromise all claims. But he can without such consent sell the property of the company, collect assets, and distribute dividends. The directions of the shareholders override any directions of the committee. In matters of administration, the liquidator is controlled by the board of trade, and as far as his legal powers are concerned he is subject to the control of the courts.

J. E. C. M.

LIQUOR LAWS. British legislation for the regulation of the sale of intoxicating liquors practically begins with 9 Geo. IV., and has been subject to modifications and extensions, down to the present time. In some respects legislation is more advanced in the British colonies and in certain portions of the United States than it is in the mother-country. In Great Britain Sunday closing is partial, whereas it is very general in the colonies; while the principle of LOCAL OPTION (*q.v.*) has obtained in many colonies, and even total prohibition in certain districts of America. Great improvements were made in the licensing laws by the acts of 1872 and 1874, though they contain only a part of the statute law with regard to licensing. It has been remarked that a more thorough reform of the laws would have been effected by an act repealing all existing statutes and re-enacting their provisions in a codified form. As matters stand, it is difficult to grasp in full scope and detail the spirit of the numerous existing enactments. The Act of 1872 introduced by Henry Austin Bruce, home secretary, afterwards Lord Aberdare, is the principal act. It does not apply to Scotland, however, and only partially to Ireland. Severe penalties are imposed by the act on the illicit sale of liquor, on drunkenness in any public place or highway, upon permitting drunkenness or gambling, or the harbouring of prostitutes on licensed premises, upon harbouring constables on such premises during their hours of duty, and upon bribing or attempting to bribe them. The act further fixed the hours of closing, but empowered the local authority to grant exemptions from them when the convenience of many persons engaged in lawful business so required. Any licensed person, on a third conviction for offences against the act, is to forfeit his licence, and to be disqualified for five years, and his premises for two years, from receiving another; but a conviction more than five years old is not to be taken into account for the purpose of increasing any penalty. In every district a register of licences is to be kept showing particulars of all convictions, etc., which shall be open to inspection by any ratepayer, holder of a licence, or owner of licensed premises. A licensing committee of not less than three members is appointed annually by the justices in counties and boroughs. In boroughs, however, licences must be confirmed by the body of justices who would, but for the act, have been authorised to grant licences. An annual value is fixed by the act for all licensed premises according to their situation. Penalties under the act are recoverable by summary conviction, subject to an appeal to quarter sessions. No justice can take part in administering the act who has any beneficial interest in the manufacture or sale of intoxicating liquors. The act of 1874 modified that of 1872 as regards the hours of closing and other points, many of the modifications being of a mitigatory character. The statutes relating to the drink traffic embrace provisions with regard to the grant of licences, the qualifications of premises for a licence, the powers of licensing authorities, the transfer and removal of licences, protection of owners, the conduct and closing of premises, offences against public order, legal proceedings, refreshment houses, liabilities of innkeepers, brewers' licences, and various minor details touching the traffic. The public revenue is largely fed by the excise duties and licences. Pitt first produced a general scheme of excise in 1784, and this was embodied in the Consolidation Act of 1826, which forms the basis of the existing law. The malt duty was abolished in 1880, but brewers and distillers must still take out an excise licence, and pay duty on everything manufactured. A licence is also necessary to wholesale or retail dealers in beer, spirits, or wine. By the Local Government Act of 1888 the duties on retailers' licences

are transferred to the county councils. An act of 1830 allowed beer licences to be taken out without application to the magistrates, but later acts brought all beer-houses and refreshment-houses under their control. Special sessions are held once a year under the General Licensing Act of 1828, for the grant and renewal of licences, and at more frequent intervals for dealing with applications for transfers. The Wine and Beer-house Act of 1869 defines the regulations with regard to licences for the sale of drink to be consumed off the premises. In Scotland, the Home Drummond Act of 1828 regulates the general licensing arrangements, but the Forbes MacKenzie Act of 1853 (amended in 1862 and 1867) provided a new form of magistrates' certificate, which prohibited the sale of liquor between 11 P.M. in large towns, or 10 P.M. in the country, and 8 A.M., and during the whole of Sunday. The Irish licensing laws are similar to those of England, but with some modifications in favour of the publican. An act of 1874 introduced six-day licences, and in 1878 another act enforced total Sunday closing except in the five largest towns. The liquor regulations prevailing in the colonies are very diverse. New Zealand and Queensland are the two Australasian colonies with full powers of local option, but the privilege has been little used. Limited option prevails in the other colonies with the exception of Tasmania. In South Africa stringent legislation exists against the sale of intoxicants to natives, but there are frequent complaints that it is not sufficiently enforced. As regards whites, the laws are inefficient. Legislation in the crown colonies on the drink traffic is very varied, local option being met with as well as Sunday closing and the prohibition of the sale of drink to minors. The imperial parliament has periodically discussed the liquor question as affecting India and Ceylon. It has frequently been asserted—though by the Indian government denied—that the authorities have endeavoured to stimulate the sale of drink among natives for the purpose of improving the revenue, and a similar charge has been made against the colonial government of Ceylon. Whatever may be the cause, the sale of drink in India has increased of recent years, and parliament will no doubt be called upon to legislate on this matter. Canada has a local option law known as the Scott Act (1878), under which localities can close, by a majority of votes, all licensed premises without compensation; but when public opinion changes in any district the suppression may be reversed. Speaking generally, restrictive laws prevail in in some form throughout the whole of the Dominion, while in the North-West Territories there is total prohibition. Throughout the larger portion of Canada, the United States, and some of the Australasian colonies, two important provisions prevail, under one of which the relatives of any person who comes to his death through intoxicating liquor may sue the seller for damages; while under the other both magistrates and the relatives of intemperate persons may notify the sellers of drink not to supply it to such persons. This latter power is now being adopted in many colonial liquor acts. In many states of the American Union prohibitive legislation, as the Maine liquor law, obtains, and in others the high-licence system is adopted. Alike in Great Britain and the colonies public sentiment grows in favour of legislation which shall strike still further at the growth of the liquor traffic (see GOTHENBURG SYSTEM).

Recent acts passed are the Licensing Amendment (Scotland) Act 1897, the Habitual Inebriates Act 1898, and the Beer Retailers' and Spirit Grocers' Retail Licences (Ireland) Act 1900, and the Licensing Act 1902, which contains some excellent provisions in respect to drunkenness, the granting of licences, and the better regulation of clubs, but fails to embody many recommendations contained in the two Reports of the Royal Commission on Licensing Laws presented in 1899, including a large reduction in the number of licensed premises, and, in an addendum, entire Sunday closing and LOCAL OPTION. The Public-House Trust movement since 1902 has made systematic attempts to get public-houses into public hands, to eliminate the element of private profit, to maintain public-houses as refreshment and not as drinking saloons, to provide counter-attractions and only the most wholesome articles, and to establish canteens where required on large public works.

[Spofford, *American Almanac, Statistical, Financial, Political*, 1879-84.—*Chambers, Encyclopædia*, vol. vi.—*Hazell's Annual*.—Dewar, *Liquor Laws for Scotland*.—Stone, *Justices' Manual*.—*Economic Journal*, September 1902.] G. B. S.

LIRA (Italian coin). The equivalent of the French franc (see FRANC).

LIST, FRIEDRICH (1789-1846), was the son of a respectable tanner at Reutlingen. Not liking his father's business, he became a clerk in the public service. He continued a diligent course of self-culture, and already in 1816 had risen to the post of ministerial under-secretary. The king of Würtemberg, being desirous of calming popular effervescence in his State by liberal concessions, made Von Mangenheim his chief minister. List warmly supported the reform movement, and was appointed in 1817 professor of economics and "Staatspraxis" in the university of Tübingen. On the fall of the minister, List, having acted as adviser of the recently-founded society of trade and manufactures, which aimed at the abolition of internal duties as an impediment to commerce, was obliged in 1819 to resign his professorship. He was elected a member of the Würtemberg chamber, and worked earnestly for an extension

of self-government, for the introduction of jury-trial and publicity of proceedings in criminal cases, for the sale of the domains, and other reforms. He was in consequence expelled from the chamber and condemned to a ten months' imprisonment, from which he was released on promising to quit the country. He then emigrated to America, where he remained from 1825 to 1832, was successful as a journalist and as a speculator in coal and railways, and acquired favour with the Pennsylvanian manufacturers by his *Outlines of American Political Economy*, 1827, which contained a defence of protective duties. After having been employed on a mission to Paris, he became in 1832 United States' consul, first at Leipzig, and afterwards for Baden. On his settlement in Germany he devoted himself to the advocacy of a railway system for that country, to which, at the time, many interests and prejudices were opposed; and really gave a powerful impulse to its construction. He threw himself somewhat later into the agitation for a ZOLLVEREIN, and contributed greatly to its success by his ardour and eloquence. With this practical movement his name must always be closely associated, and through it, with the history of Germany. He was personally ill-supported by the public, and had to struggle with financial difficulties; and, bodily disease and suffering being added, he sank under the burden, and died by his own hand 30th November 1846.

Germany owes List a great debt of gratitude for the services he rendered in the promotion of her material prosperity. When residing in America, he said that his own country always lay in the background of his plans, and on his return he worked in her interest with extraordinary zeal and assiduity. As an author, he is known chiefly by his *Das Nationale System der Politischen Oekonomie*, of which the first and only published volume, dealing with INTERNATIONAL TRADE, appeared in 1841 (7th ed., by Eheberg, 1883). In this work he is much indebted to A. MÜLLER, a deeper thinker than himself, some of whose best thoughts are reproduced in it, though in a less abstract and more practical form. Like that writer, he takes up a position in some respects strongly antagonistic to Adam SMITH, who, in his opinion, kept private interests too exclusively in view, and, when he ceased to be individualistic, became cosmopolitan. The *national* idea is predominant in List. Between the individual and humanity —he says—stands the nation, a collective and continuous existence, possessing a deep-seated unity founded on a thousand bonds of feeling and interest—with a descent, a language, a literature, a history of its own, and laws, institutions and economic aptitudes peculiar to itself. To its permanent well-being, on which depends the ultimate highest good of all its members, the immediate interests of individuals, which do not always further it, should be strictly subordinated. The really important object is not the present creation of exchange values, but the development of the productive powers of the nation. The requirements of different nations must be met in different ways, depending partly on their respective characteristics, but chiefly on the degree of development which they have attained. All communities—at least those of the temperate zones—after emerging from the hunter and pastoral systems of life, pass through three successive economic stages: (1) that of agriculture; (2) that of agriculture united with manufactures; and (3) that of combined agriculture, manufactures, and commerce. The last of these forms of national economy, as it is the product of a higher grade of evolution, so also is greatly superior to the others in its reflex influence on civilisation. It marks the full maturity of a society; and it is the function of government to facilitate by suitable economic measures the natural movement of the community towards this highest stage. In the purely agricultural period, free trade with richer and more cultivated societies is the right policy as tending most to the advancement of the national culture. And it becomes so again when the productive powers of the nation have been fully developed. But in the intermediate stage a gradually introduced protective system is the proper resource for training and maturing the industrial capacities of a people, which, in its absence, could not hold their ground in the home market against the competition of more advanced communities. Thus the protective system ought not to be a permanent order of things, but temporary and provisional only. It is, in fact, a means of industrial education carried on at the expense of the nation, and ought to cease with the necessity for it. According to List, England alone in his time had reached the highest stage, and France was approaching it. For England free trade was the right policy. When Germany under, and by means of, protection, should have completed her industrial education, and so enabled herself to overcome the obstacles to her success in the markets of the world presented by the already-acquired superiority of other countries, free trade ought to become *her* policy also. And the adoption of that system by all nations under like conditions would realise the economic ideal and mark the consummation of general well-being. This theory, though stated too absolutely and thus requiring modification, seems certainly to contain some elements of truth. List, besides criticising effectually weak points in the systems of his predecessors, did much towards introducing the relative historical spirit into economic studies, and emphasising the political—and in some degree also the moral—considerations which often enter into the solution of industrial problems. His writings

referring for the most part, directly or indirectly, to questions of the day, had a powerful effect in Germany by interesting the middle classes in economic doctrines and making those doctrines subjects of general discussion.

Apart from his errors of principle, and the materialistic tinge which—though he would have repudiated the charge — undoubtedly colours his ideas, his chief faults are a tendency to exaggeration, the product in part of his eager temperament and exuberant rhetoric, his habit of unduly depreciating the economists whose views he controverted, and looseness and want of system in his exposition of scientific principles. He had the art, however, of catching the popular ear ; and indeed it is impossible not to be attracted by the freshness, the vigour, and the tone of profound conviction, which characterise his writings, as well as by his ardent patriotism, and his intense belief in the great future which awaited his country. The success of his principal book, though aided by the harmony of its doctrines with the contemporary circumstances and aspirations of Germany, was not exclusively due to this, but was the merited reward of its contributions to economic thought.

List also wrote much in the public journals of his time in favour of the creation of a railway system and the establishment of the ZOLLVEREIN, and founded, in 1833 and 1843 respectively, special organs for the advocacy of these objects. He also contributed a series of articles to the *Staats-Lexicon* of Rotteck and Welcker. Amongst his minor pieces may be mentioned, *Das Nationale Transport-system* (1838).—*Die Ackerverfassung, die Zwergwirthschaft und die Auswanderung*, 1842, in which he advocated the 'grande-culture,' and *Die politisch-ökonomische National-einheit der Deutschen* (1846). There is a collected, though not complete, edition of List's writings by Häusser (3 vols., 1850), with a biographical memoir of him. The *National System* was translated in America by G. A. Matile, preface by S. Colwell (1856), and in England by Sampson Lloyd (1885). New edition, Introduction by J. Shield Nicholson (1904).

LITTLE GOES. A species of lottery declared unlawful by 42 Geo. III. c. 119.

[Wharton, *Law Lexicon, sub voce.*]

LITH, JOHANN WILHELM VON DER (1709-1775), belongs to the numerous class of German writers and statesmen who, during the last century, considered most questions of administration and finance from the standpoint of what they called *populosity, i.e.* the development of population. This prepossession, natural in a country which had been depopulated by the havoc of religious and political wars, was pushed by them to an undue exaggeration, shared by the German princes anxious to strengthen their military power. For instance, these writers mostly advocated the excise system because excise duties are paid without compulsion, and do not excite the population to emigrate.

These and parallel opinions are maintained by Von der Lith in his *Politische Betrachtungen von verschiedenen Arten der Steuern* (Political Considerations on different kinds of Taxation), 1751, and in his *Neue vollständige erwiesene Abhandlung von denen Steuern und deren vortheilhafter Einrichtung in einem Lande nach den Grundsätzen einer wahren, die Verbesserung der Macht eines Regenten und die Glückseligkeit seiner Unterthanen wirkenden Staatskunst* (A new and complete Exposition of a beneficent System of Taxation on the principles of a true statecraft which furthers the power of a ruler and the happiness of his Subjects), 1766.—Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 425, describes the latter book, although dry and heavy, as showing a solid knowledge of German and foreign financial institutions and literature. E. CA.

LIVERY. The term "livery," meaning at first an allowance (*liberatio*) in food and clothing to the servants of great mediæval households, soon came to be restricted to the gift of clothing, and then to the clothing itself. It became common in England in the 14th century for the great lords to clothe their retainers in a uniform, and to give "livery of company" also to their friends and dependants, a practice which greatly increased the tendencies of the time towards baronial lawlessness and faction. Accordingly it was restricted by a long series of statutes, beginning in the reign of Richard II. ; though it was not until the accession of Henry VII. that the government was strong enough to enforce them.

[Dr. Stubbs, *Const. Hist.*, iii. § 471, was the first to lay stress upon the custom of livery as "an important element among the disruptive tendencies of the later middle ages." The well-known story of Henry VII. and the Earl of Oxford is told by Lord Bacon in his *Life* of that king (see, for another sense of the term, LAND, LAW RELATING TO ; SEISIN).] W. J. A.

LIVERYMEN. The wearing of a uniform LIVERY (*q.v.*) was not peculiar to baronial retinues ; it was common upon festive or ceremonial occasions with the members of fraternities of various kinds—including the fraternities of crafts. In a petition of 1389, the Commons prayed not only that the liveries of lords should be restricted, but also that no livery should be given "under colour of gild or fraternity," and "that no craft should give livery to any." In 1406, however, the statute concerning liveries expressly exempted "gilds and fraternities, and also the people of misteries that be founded and ordained to a good intent and purpose." At this time probably every member of the companies of crafts wore the livery from time to time ; but before the end of the century it had in London become a

mark of a certain superiority of some members over others—a change due perhaps to the increasing costliness of the attire, and the unwillingness of ordinary freemen to lose the time necessary for attending pageants. Among the drapers in 1493 there were 114 "of the craft in the clothing," 115 "of the brotherhood out of the clothing," and 60 in the bachelors' company. By about the middle of the 16th century the "livery" constituted in most of the crafts a higher grade to which the more substantial freemen were admitted by the court of assistants, upon the payment of heavy fees. In the smaller companies it would seem that the "livery" at first included all or almost all the employers, in the greater only the more substantial; but during the next century the companies began to lose their close connection with the industrial occupations from which they had arisen. An act of common council in 15 Edward IV., ordering the heads of the companies to come to elections "with the honest men of their misteries in their best liveries," led to the liverymen obtaining an exclusive right to vote both for the chief civic magistrates and, until 1835, for the members of parliament for the city; the gathering of the liverymen of the companies for the former purpose is known as the "common hall." The social position of liverymen during the last two hundred years is sufficiently indicated by the act of the court of aldermen in 1697, "that no person shall be allowed to take upon himself the clothing of any of the twelve companies unless he have an estate of £1000, of the inferior companies unless he have an estate of £500." At present, with about 10,000 ordinary freemen, there are some 7300 liverymen in the several companies; of these about 1500 constitute the courts of assistants (see also COMPANIES, CITY OF LONDON).

[The early history of the "livery" will be found in Ashley, *Economic History*, i. pt. ii. pp. 125-132. The present position of the livery in the various companies may be best studied in the *Report of H.M. Livery Companies' Commission* (1884), which is conveniently summarised in the *Introduction* to Mr. W. Carew Hazlitt's *Livery Companies* (1892), where also will be found some indications as to the peculiar privileges and burdens of liverymen.] W. J. A.

LIVERY COMPANIES. This term for those "companies" in London which have grown out of the old fellowships of crafts, and the LIVERYMEN (*q.v.*) of which had an exclusive right to the civic franchise, would seem to have come into use in the 18th or early 19th century, probably with the appearance of "companies" of another sort from which they needed to be distinguished. William Herbert, the librarian to the Corporation of London, entitled his book *The History of the twelve great Livery Companies* (1834), and the royal commission of inquiry appointed in 1880 was designated the "Livery Companies' Commission." But it does not seem that any clear distinction has been drawn by competent authority between "livery" companies and those other companies —of which several survived until quite recently —which had a somewhat similar origin (see COMPANIES, CITY OF LONDON). W. J. A.

LIVERPOOL, CHARLES JENKINSON, first Earl of (1727-1808), was born at Winchester, of an old Oxfordshire family. After a distinguished career at Oxford, he began to prepare for public life. In March 1761 he was appointed by Bute an under secretary of state, entered the House of Commons, and filled various minor offices until 1772, when he was appointed vice-treasurer of Ireland, and a privy councillor. Three years later he purchased from Fox the valuable patent place of clerk of the pells in Ireland, and became master of the mint. In 1778 he was appointed secretary at war under Lord North, and was supposed to possess almost unbounded influence over the king and the prime minister. Pitt, whose commercial and financial policy he warmly admired, appointed him a member of the board of trade in 1783. Jenkinson had a large share in framing the commercial treaty between Great Britain and America of 1784, and he also assisted to establish the South Sea fishery. In 1786 he was created Baron Hawkesbury, and was appointed chancellor of the duchy of Lancaster and president of the committee of council for the affairs of trade and plantations. He was created Earl of Liverpool in 1796.

Lord Liverpool's speeches in the House of Peers were almost entirely confined to economic and financial questions. In 1797 he defended the constitution and conduct of the committee appointed to report on the suspension of cash payments; and the following year spoke in defence of the Assessed Taxes Bill, by which an income tax of 10 per cent was imposed on incomes above £200.

Lord Liverpool wrote *A Discourse on the Conduct of the Government of Great Britain in Respect to Neutral Nations*, published 1758, 2nd ed. 1794; (this tract, which is described by M'Culloch, *Lit. Pol. Econ.*, as being "learned, moderate, and able," supports the view that "neutrals are not to be allowed to carry on a trade during war from which they had been excluded during peace,") and *A Dissertation on the Establishment of a National and Constitutional Force in England independent of a Standing Army*, 1756.

In 1785 appeared, in 3 vols., his *Collection of all Treaties of Peace, Alliance, and Commerce between Great Britain and other Powers, from the Treaty of Munster in 1648 to the Treaties signed at Paris in 1783.*

In 1805 Lord Liverpool addressed his well-known letter to the king (George III.), published as *A Treatise on the Coins of the Realm*, 1805, reprinted 1846, and in 1880 by the Bank of England, which "comprises . . . a greater amount of infor-

mation respecting the coins of the kingdom, and a more comprehensive and elaborate exposition of the principles on which the coinage should be conducted, than is perhaps to be met with in any other publication" (M'Culloch, *Lit. Pol. Econ.*).

This work was originally written, with the co-operation of George Chalmers, as a draft report for a conference of the privy council in 1798, appointed to enquire into the state of the coins, etc., and it had great influence in the adoption of the gold standard in 1816. (See second Earl of LIVERPOOL.)

[Yonge's *Life of the Second Earl of Liverpool.*—Stanhope's *Life of Pitt.*—*Annual Register*, 1808. —And *Dictionary of National Biography*, vol. xxix.] G. B. S.

LIVERPOOL, ROBERT BANKS JENKINSON, second Earl of (1770-1828), educated at Charterhouse and Christ Church, Oxford, entered parliament in 1790. Appointed in 1794 to the India board, he became, five years later, master of the mint. When his father was raised to an earldom he was known as Lord Hawkesbury. He was a close student of political economy and finance; in 1796 he maintained that the commercial condition of Great Britain—notwithstanding the pressure of the great war—was more prosperous than at any antecedent period, and regretted that the system of appropriating a million annually to the extinction of the national debt had not been adopted at the close of the previous war in 1748, as the burden would have since been lifted from the shoulders of the nation. Hence it was natural that he should regard the sinking fund established by Pitt as "unquestionably the greatest measure ever produced by the ingenuity or wisdom of man," and gave his adhesion to the financial axiom that the supplies, or a considerable portion of them, should be raised within the year.

As foreign secretary he negotiated the Treaty of Amiens in 1801. Two years later he was raised to the Upper House as Baron Hawkesbury during his father's lifetime. In 1808 he became Earl of Liverpool on the death of his father. In 1810 the bullion committee of the House of Commons reported on the depreciation in the currency. Lord King and other large landowners refused to receive their rents except in gold; and guineas were extensively bought at from twenty-three to twenty-seven shillings, by agents of the government, to remit to the Peninsula. Lord Stanhope introduced a bill in the House of Lords to make it illegal for any person to give more money for guineas, half-guineas, etc., than their lawful value. Lord Liverpool at first opposed this bill, but subsequently assisted in carrying it through.

During the same session he supported Mr. Vansittart's bill on the sinking fund, which repealed the act of 1802, but adhered to Mr. Pitt's original measure of 1792. Lord Liverpool also supported Mr. Vansittart's celebrated resolutions, in opposition to those of Mr. Horner, which advocated a return to cash payments. One of Vansittart's resolutions affirmed that bank-notes were equal to gold despite the fact that £100 of notes could only purchase £86 : 10 : 6 of gold. Party feeling alone can account for the support Vansittart received.

In 1812 Lord Liverpool came into power at the head of a purely Tory ministry, the first ten years of which witnessed much reactionary movement on the continent and at home, the mismanagement of the national finances, the increase in the duty on foreign corn, and the adoption of coercive measures for dealing with discontent in England. All these things were charged to the incapacity of the government. Personally, Lord Liverpool was a free trader, and regarded the corn law of 1815 merely as an experiment. When Huskisson and Canning joined the ministry, he began to liberalise the tariff, and desired to retain a portion of the property tax, a measure which would have greatly favoured the working classes. But opposed by Whigs and Tories alike, it was defeated in the Commons. In spite of its reactionary policy on certain national questions, and much vacillation of opinion, Lord Liverpool's ministry may be regarded as the pioneer administration of free trade.

Besides those already mentioned, the following are the principal financial events of Lord Liverpool's ministry. In 1816 he carried the measure entitled "An Act to provide for a New Silver Coinage, and to regulate the currency of the Gold and Silver coin of this Realm"; which established the gold standard in this country and made silver token money (coined at the rate of sixty-six shillings to the owner instead of sixty-two) the standard rate, and limited to forty shillings as legal tender. The effect of this act has been severely criticised, and it was commented on by W. HUSKISSON (*q.v.*) at the time. In 1818 he carried a proposal fixing the ensuing year as the time for the resumption of cash payments. He cordially supported Peel's bill to regulate the employment of children in factories. In 1819 reduction in taxation was followed by various measures in the direction of free trade; and in 1820 the premier expounded his liberal ideas on the subject of foreign commerce, but showed that our laws with respect to agricultural produce alone threw an insurmountable obstacle in the way of complete freedom of trade. The sinking fund was a blunder which has never been defended; but Liverpool's general policy with regard to the currency and commercial panics during the early years of George IV.'s reign has been both warmly eulogised and objected to as the cause of much financial trouble.

In 1821 the bill for the resumption of cash payments was carried through both Houses, and in defending the substitution of gold for £1 notes, to the extent of six or seven millions, Lord Liverpool also vindicated the measures taken to establish an efficient sinking fund, to the amount of five millions. He expressed himself as opposed

in principle to legislation which favoured or burdened one industry more than another, and had approved, on its own merits, a system of unrestricted trade; though he admitted that a country which had so long followed an opposite policy could not easily abandon it. But in 1826 he avowed that neither the corn law of 1815, nor that of 1822, was applicable to existing circumstances of prevalent distress and industrial depression. He declared himself individually responsible for the ministerial proposal to confer on the administration a discretionary power to permit a limited importation of corn; and this power was shortly afterwards exercised. In fact the premier's opinions were moving so rapidly in the direction of an amelioration of the corn laws, that he prepared a measure of relaxation which was introduced in the new parliament, though illness prevented him from personally conducting the measure.

The severe money panic in England at the close of 1825 led to the stoppage of a great number of banks, while the whole circulation of the country was practically paralysed. Government at once resolved to issue one- and two-pound Bank of England notes to relieve the country, and an extraordinary coinage of sovereigns was ordered. In the session of 1826 the Small Note Bill was passed, which provided for the suppression of notes under £5. By a further measure the law of 1708 was repealed, and banks with any number of partners were allowed to be established beyond sixty-five miles from London, while the Bank of England was permitted to establish branches to be carried on by its agents.

[*Memoirs of the Public Life and Administration of the Earl of Liverpool*, 1827.—*Life of the Second Earl of Liverpool*, by C. D. Yonge, 3 vols. 1868.—Kebbel's *History of Toryism*, 1886.—*Dictionary of National Biography*, vol. xxix.—*Annual Register*, 1828.] G. B. S.

LIVING WAGE. This expression is generally confused with the cognate "minimum wage," *e.g.* the lowest rate paid on a sliding-scale arrangement, which may be defined as the claim of labour to a definite low daily or weekly wage, without any guarantee of the permanent employment which would make it a wage sufficient to live on. It came to the front during the great coal strike of 1893. But it is impossible to limit the claim of a living wage to any section of workers,—by whom, indeed, it might be attainable given strict combination, limitation of numbers, and maintenance of price,—and the expression seems likely to take root as the claim of labour generally to a preference share in the total product of industry.

Plausible as the catchword seems, on examination it does little more than suggest questions. Is any preference share really possible—say that the guarantee of a living raised the sluice-gates of population? Suppose the claim granted, is the "living" in question mere physical subsistence or life at a conventional level? and is it a "family wage" or an "individual" one? If Great Britain's estimated income, divided by its population, gives some £36 per head, what kind of living wage does that income provide even on the footing of an equal distribution? Would the national income be maintained and increase if it were thus distributed? How far may the "living" of capital be reduced without reducing the national dividend and so reducing the living wage? Unless industrial efficiency increase proportionally with the living wage, how could our free-trade country compete with others? All the same, has labour not a better claim to a preference in the national dividend than any other factor? If equal distribution would give so small a sum per head, what kind of living does the present distribution afford to the masses?

The expression gives at least one valuable reminder. Giffen (*Essays in Finance*, second series, 1886, p. 463), comparing wages in 1883 with wages fifty years before, has calculated that the income of the manual labour classes per head has increased on the average much more than 100 per cent. Taking this with the fact that wealth in Great Britain seems to increase more than twice as fast as population, it is obviously possible that the standard of living should steadily rise; and it is right that average industry should claim a wage rising in correspondence — always remembering that a real rise in wage may be expressed in low prices, and that changes in currency may even disguise an increase of wage in lower money figures. But the dislocations seemingly inevitable in any system of competitive industry make any guarantee of a living wage by individual employers impossible, and throw doubt on the possibility of its being guaranteed under any imaginable organisation of human society.

[Giffen, *The Growth of Capital*, 1889.—Smart, *Studies in Economics*, 1895.—Marshall, *Elements*, ch. xii. § 16, cp. COMFORT, STANDARD OF.] W. S.

LIVRE. Of the many notable features in the financial history of France none is more remarkable than the complete distinction between money of account and the money in actual circulation. The distinction was neither unique nor original, but in no country was it so sharply drawn as in France from the 10th to the 18th century. The origin of the money of account is traced by all authorities to a capitulary of Charles the Great, which ordered that the pound of silver (*libra argenti*) should be divided into 20 *solidi*, and each SOLIDUS (*q.v.*) into 12 *denarii* (see DENARIUS). From this time the terms of commercial transactions, whether sales or contracts extending over a period of time, were expressed in *livres*, SOUS, and DENIERS. These always retained the same proportion to each other, 12 *deniers* to the *sou*, and 20 *sous* to the *livre*. In Frankish times all three terms may have denoted actual coins, but under the Capet kings these disappeared from circulation. In the 11th century

the MARK, containing 4608 grains, took the place of the *livre* or pound as the ordinary measure for the weight of bullion. From this time the *livre* ceased to connote any idea of weight, as it had already of coin, and thus the separation of the money of account was completed. In later times the names reappear, *e.g.* the *sou d'or* and the *denier d'or*, but the existence of these coins was very short-lived, and they had no connection whatever with the *sou* and the *denier* as terms of account. An infinite variety of coins were issued from time to time, such as the *agnel* or *mouton d'or* and the *gros* and *petits tournois* under Saint Louis, the *écus d'or* and the *blancs* of the Valois kings, the *louis d'or* and the *louis d'argent* of the Bourbons, etc. But the value of all these coins was expressed in the money of account, *i.e.* in *livres*, *sous*, and *deniers*.

The break-up of the Karolingian empire put an end to the monetary centralisation which Charles the Great had established. In *Francia Occidentalis*, which became France, the great vassals claimed and obtained the right of private coinage in their own domain. What is more extraordinary is that the money of account became localised as well as the circulating coins. Thus we hear of *livres*, *sous*, and *deniers* with local designations, *e.g.* Parisis, Tournois, Manceaux, Poitevins, Toulousains, Angevins, etc. The Capet kings, originally dukes of Paris, naturally adopted the *livre parisis* of their own domain. As time went on the power of the crown developed steadily at the expense of feudal privileges. Saint Louis ordered that the royal money should circulate everywhere side by side with that of the lords, and forbade the latter to imitate the king's coin. This policy, steadily pursued by his successors, resulted in the recognition of a single currency for the whole of France, and the local money, where it survived, was restricted to small copper coins with a very small area of circulation. But during the process of centralisation, one of the local monies of account came to be adopted by the crown. The *livre tournois* had come into general use in southern France, and when Languedoc was annexed to the royal domain, its method of reckoning was retained side by side with that of Paris. From this time we have two alternative monies of account, the *livre sou* and *denier parisis*, and the *livre sou* and *denier tournois*. The former money was always valued a fourth higher than the latter. A *livre parisis* equalled 20 *sous parisis* and 25 *sous tournois*. Thus when a mark of silver was valued at 2 *livres parisis*, it would at the same time be equivalent to 2½ *livres tournois*. This double system lasted till the reign of Louis XIV., who abolished the *livre parisis* and retained only the *livre tournois* and its divisions, which had long been the money of account in ordinary use.

Although the proportion between the *livre*, the *sou*, and the *denier* remained unaltered from the time of Charles the Great to the Revolution, their actual intrinsic value was subject to constant change, almost invariably in the direction of depreciation. It would take too long to trace the variations in the value of the *livre*, which have been treated with equal learning and acuteness by several French writers. A few salient facts must suffice. The exact weight of Charles the Great's *libra argenti* has been disputed, and the amount of silver it contained has been variously estimated as equal to 86 francs 97 centimes, or to 78 francs 20 centimes of modern money. Of course its purchasing power was infinitely greater, but it is simpler and safer to measure only intrinsic value in silver. Under Louis IX. (1226-1272) the *livre* was equivalent to only about 18 francs. By the 18th century it had fallen to practically 1 franc, and at times to about 80 centimes.

This steady depreciation of the money of account was primarily due to the fact that the coinage was in the hands of the king, who considered that he had a right to make a profit or SEIGNIORAGE on the process. It is obvious that the distinction between money of account and actual money offered to the French kings exceptional temptations and opportunities for debasement. In other countries, where no such distinction existed, the king could only debase by re-coining the metals either with less weight or with a larger admixture of alloy. In France the king could employ this method if he chose, but he could also have recourse to a simpler expedient. When the crown ordered the issue of coins, it was necessary not only to fix their proportion to the mark of gold or of silver, but also to settle their value in terms of the money of account. This latter value was not always expressed on the face of the coin, and therefore it was perfectly easy for a king to depreciate the *livre* by a new edict giving a greater nominal value to the same coin. The royal methods may be illustrated by two actual facts from the history of Philip IV., who is pilloried both in contemporary chronicles and in history as the *faux-monnayeur*. When he came to the throne he found a silver coin in circulation, called the *gros tournois*, issued by his grandfather, Louis IX. Fifty-eight of these coins were made from the mark of silver, and the value of each was 1 *sou*, or the twentieth part of a *livre*. Among the new coins struck by Philip was a *petit tournois*, of which 116 were made from the mark, and which should therefore have been worth 6 *deniers*, or just half the *gros* of Louis IX. Instead of this, the edict fixed its value at 7½ *deniers*. As the new piece could not have circulated side by side with the older coinage, a new ordinance raised the *gros tournois* from 1 *sou* to 15

deniers, without making any change whatever in the coin itself. The result of these two changes was to reduce the intrinsic value of the *livre tournois* from about 18 modern francs to about 14 francs 40 centimes. It is needless to insist upon the damage that must have been done to trade by such changes as these serve to illustrate, and history is full of the indignation which they excited. There was one obvious remedy for these abuses, viz. to fix bargains by weight of silver, so that the debtor should in the end pay to the creditor as many marks as he had received. This expedient was frequently attempted, but was as often prohibited as being an attack upon the royal prerogative.

With the old monarchy fell the monetary system which it had at once misused and upheld. The constituent assembly introduced the modern arrangement by which the mint is simply a business organisation for affixing a stamp to the precious metals, and charges nothing beyond the expense of the process, except in the case of coins whose legal tender is limited. This change was completed by the law of the 17th Germinal of the year xi. (28th March 1803), which fixed the franc at 5 grammes of silver with a fineness of nine-tenths. It is true that the law of 14th July 1866 lowered the intrinsic value of the franc and limited its legal tender. But by that time events had occurred which practically established a gold standard in France, confirmed by the law of 1875, closing the mint to the free coinage of silver. The change of standard makes no difference to the fact of the disappearance in France of that distinction between the money of account and the coin in circulation of which the *livre* is the most prominent illustration.

[See Ducange, *Glossarium*, s.v. "Moneta."—Le Blanc, *Traité historique des monnaies de France*.—Vuitry, *Études sur le régime financier de la France*.—P. Clément, *Jacques Cœur et Charles VII.*] R. L.

LIVRE DE RAISON, THE, was in old French (*liber rationum*) the ledger into which every banker and merchant was obliged to enter his receipts and expenditure. But in southern France, and especially in Provence, the term included family-books (*livres de famille*) in which the head of the family used to put down genealogical details and miscellaneous notices, for instance of political events and famines; the information yielded is often invaluable for the student of economic history.

[Attention was first called to the *Livres de Raison* by M. Charles de Ribbe, a friend and disciple of Le Play, in his *Famille au 16me Siècle* (1867). Since then many have been published, some of them going so far back as the 14th century; a bibliography on the subject occupies 52 pages in M. Tamizey de Larroque's *Livre de Raison de la Famille de Fontainemarie* (Agen, 1890). See also Ch. de Ribbe, *Le Play d'après sa Correspondance* (1884), pp. 127-139, and Lavisse, *Histoire de France* (1902), iv. 2nd part, pp. 152 and 159.] E. Ca.

LIVRET (Fr.), the little book workmen in France were formerly required to hold under a law of 1st December 1803. It was delivered by the mayor of the place of domicile, and served to contain the date of entering and leaving the service of each employer, and had to be presented for the *visa* of the mayor, or commissary of police of the district, on each change of employment or residence. Masters were forbidden to make any other entry, either favourable or unfavourable, concerning the conduct or qualifications of the workman, but, if the man owed money for wages advanced, the debt could be noted on the *livret*, and the next employer became liable for a sum not exceeding thirty francs, which he could recover by a deduction of 10 per cent from the workman's pay. The *livret* served as a passport in the interior, and workmen travelling without one were liable to be arrested as vagrants. *Livrets* were abolished by a special law of 2nd July 1890, but by the same law masters are compelled to give, if demanded, a certificate containing exclusively the date of entry and leaving, and the kind of work on which the man was employed. *Livrets* were at one time imposed by decree on domestics of both sexes, but the rule was rarely observed. T. L.

LLOYD'S. The name of the association by which UNDERWRITING business is mainly carried on in London. The meeting of merchants who, in 1688, habitually used the coffee-house of Edward Lloyd in Tower Street, and which afterwards migrated to his coffee-house in Lombard Street, gradually developed into the powerful institution incorporated by the act of 1871, with "all the rights and privileges of a corporation sanctioned by parliament. According to this act of incorporation the three main objects for which the society exists are—first, the carrying out of the business of marine insurance; secondly, the protection of the interests of the members of the association; and thirdly, the collection, publication, and diffusion of intelligence and information with respect to shipping."

The association is managed by a committee appointed by the members. Of these the "underwriting" members deposit security for the fulfilment of their engagements. The business is conducted in a very simple manner through brokers who write down the name of the ship, the master, the circumstances of the voyage, and the amount to be insured. Each underwriter who agrees to join subscribes his name and the sum he takes.

The immense development of the shipping business of this country in recent years (see FREIGHT) has been followed by a very large increase in the business of marine insurance, of which a great part is carried on at Lloyd's (see INSURANCE, MARINE).

LLOYD'S BONDS. Instruments under seal invented by a parliamentary draftsman, whose name was Horace Lloyd, issued by companies acknowledging indebtedness for a specified sum, and containing a covenant to pay that sum with interest on a specified day. They were at one time much used by railway companies for the payment of contractors, who thereby acquired a security which they could realise, or on which they could raise money. They could be issued in respect of an existing debt only, and not for the purpose of borrowing in excess of borrowing powers. As it is now usual for railway companies to obtain extensive power for the issue of debentures or debenture stock, the name of Lloyd's bonds is no longer seen except in legal text-books.

[Tarrant, *Lloyd's Bonds*, 1867.] E. S.

LOAN (MUTUUM), CANONIST DEFINITION OF. The arguments by which the canonist doctrine of usury were supported, rested, for the most part, on a particular conception of "lending," *mutuatio*, derived from the Roman law. The Roman lawyers had defined *mutuum* (as distinguished from *commodatum*) as involving a transference from one person to another, of the ownership (*dominium*, as distinguished from USUS), in the thing lent. From this definition the canonists deduced the conclusions (1) that the lender could not justly receive gain (*lucrum*) from the use of a thing that no longer belonged to him, and (2) that the burden of risk was transferred, passed to the borrower with the ownership, the lender being also, as a rule, secured against risk by holding a pledge or in some other way. Hence, *e converso*, when risk was shared (as in various forms of partnership, SOCIETAS), it was concluded that ownership had not passed; that there was therefore no *mutuum*; and that accordingly the prohibition of usury did not apply. (See MUTUUM.)

[The very name was derived, according to the Roman lawyers, from the change of ownership, The explanation, "mutuum appellatum est, quia quod ita tibi a me datum est, ex meo tuum fit," is given in almost identical terms in Gaius iii. 90, Paulus in *Dig.*, xii. 2, 2, and in Justinian *Instit.* xiv. Ignorance of the juristic distinctions of the middle ages frequently blunts the edge of modern criticism of the usury doctrine. They are given in a conveniently brief form in Miles Mosse, *Arraignment of Usury*, 1595: "*Lending* maketh a translation of the propertie: *letting* doth onely make an alienation of the use. . . . *Lending* is the translation of the dominion of a thing for no price; *selling* is the alienating of a thing for a set price to be paid. . . . In *lending* I looke for mine owne againe; in *exchanging* I looke for some other thing in lue of mine owne," etc. See also Ashley, *Economic History*, vol. i. pt. i. p. 152; pt. ii. pp. 419, 454; Böhm-Bawerk, *Capital and Interest*, p. 22; F. X. Funk, *Zins und Wucher*, pp. 170 *seq.*] W. J. A.

LOANS, FORCED. From a very early date English kings found it necessary to meet extraordinary expenses by borrowing on the security of future revenue. For a long time loans were chiefly raised from foreigners, such as the Jews; and after their expulsion in 1290, from firms of Italian bankers. The growth of wealth in the 15th century rendered it possible to raise large sums from native lenders, and the simultaneous revival of the royal power rendered it almost impossible to refuse the demands of the commissioners acting under authority of a privy seal. Under Edward IV. and the Tudors the exaction of compulsory loans from wealthy subjects became a frequent and almost regular expedient of the crown. Elizabeth, we are told, was extremely careful to repay these sums by a stipulated time, but her predecessors were by no means so punctilious. Twice in the reign of Henry VIII., in 1529 and 1544, parliament practically converted these loans into BENEVOLENCES (*q.v.*) by formally releasing the king from the obligation of repayment. That these exactions met with so little resistance was due partly to the formidable powers of the Star Chamber, and partly to the general popularity of the government. The mass of the people saw no reason to resent burdens which fell almost exclusively upon the wealthy. Things had completely changed when Charles I. and Buckingham endeavoured to raise the famous loan of 1627 for an unpopular war with France. No such general exaction had ever been attempted by the Tudors. The sum to be paid was five SUBSIDIES (*q.v.*), and every man rated in the subsidy books was to contribute in proportion to his rating. If any one refused, he was to be bound over to answer for contempt before the privy council. Considering the extreme doubtfulness of repayment, the demand was practically an attempt to levy a general subsidy without the authority of parliament. The terror inspired by the Star Chamber induced most people to pay rather than risk the penalties for refusal. But many prominent men, including Hampden, Eliot, and Wentworth, declined to comply with an illegal demand, and to contribute to an enterprise of which they disapproved. Seventy-six of the recusants were committed to prison on a special warrant of the king. But the failure of Buckingham's expedition led to increased resistance and forced Charles to summon his third parliament in 1628. This assembly drew up the Petition of Right, which demanded "that no man hereafter be compelled to make or yield any gift, loan, benevolence, tax, or such-like charge, without common consent by act of parliament." From this time the illegality of forced loans has been unquestioned.

[Hallam, *Constitutional History of England.*—Gardiner, *History of England*, vol. v.] R. L.

LOANS, LOCAL. See LOCAL GOVERNMENT.

LOANS, PUBLIC.

Method of Raising, p. 621; Internal Loans, p. 621; External Loans, p. 621; Conversion Loans, p. 621; Forms of Documents of Ownership, p. 622; Underwriting, p. 622; Issue of Loans, p. 622.

METHOD OF RAISING. Government loans are either internal or external. The special characteristic of an *internal loan* is that it is payable, interest and principal, within the country issuing it. A foreign holder of such a loan stands on the same legal footing as a citizen; but occasionally, and not as a matter of right, special arrangements have been made by foreign governments for the payment of coupons abroad, for the convenience of foreign holders, through an agent. Such an arrangement might, of course, cease at any moment.

An *external loan* is raised in part, or entirely, abroad, and its principal and interest are payable abroad as well as at home. Most countries have issued loans of both kinds. The means by which loans of either class are issued are:

A. Public issue:
   (1) By tenders at (or above) a *minimum* price per cent.
   (2) By tenders at a fixed price per cent.

B. By direct sale to a banking or financial house, which house sells again to the public when and how it pleases. In this case the first purchaser is said to take the loan "firm," and when retailing the loan to the public he may, of course, invite tenders either at a *minimum* or at a fixed price.

The selection of the mode of issuing the loan depends on circumstances. Countries whose financial position is good go direct to the public, merely paying a bank, or a financial house, a commission for the use of their premises and staff, if they do not issue through a bank of their own. French loans are issued through the bank of France, but when France was financially paralysed by the events of 1870-71 she raised a large loan through a great Anglo-American house. The British government makes issues through the Bank of England, the United States through its treasury; countries of less than the highest credit issue their loans through finance houses, with whom the loans are said to be "domiciled."

If the loan is issued at a *minimum* price, the competition for it among investors takes the form of the offer of prices above the *minimum;* if at a fixed price the competition takes the form of applications in excess of the amount really wanted. In the former case allotments are made on the principle of giving a certain percentage of the amount tendered for at a certain price, and giving all tenders above that price in full. The price will, of course, depend on the extent of the tenders. Sometimes a "syndicate" applies for more than the whole loan, and only gets a small proportion because it has not offered as much as the general public, but usually syndicates hit on a figure at which they get nearly all they wish for.

If tenders are made at a fixed price, the method usually followed in the case of foreign loans, the *nominal* amount of the tenders is sometimes enormous, but many of the largest applicants would be very sorry to be taken at their word. French government loans and the issues of the Credit Foncier have been applied for thirty or forty times over. The plan of the issuers in such cases is to allot to all small tenders in full, and the balance of the loan, after this is done, is divided *pro rata* among the larger applicants, whose tenders are assumed to be, and probably are, more or less speculative.

It does not come within the scope of this article to discuss the purposes for which public loans are issued, but it is not out of place to observe that when a finance house takes a loan "firm," this operation *may* mean that it has already lent the government money in some form or other, by an advance on treasury bills, for instance. When this is the case there is often a very considerable difference between the price the government obtains for the loan and that at which the finance house sells it to the public. In the past some very remarkable transactions of this kind have taken place, particulars of which will be found in the report of the House of Commons committee on loans to foreign states, 1875. The difference in price may be justified, for the money lent in the first instance may have tided the borrowing state over a period of difficulty and enabled it to improve its credit to such an extent that the price asked at a subsequent date is justified. In all such cases the character and position of the house which issues the loan is the real guarantee for its soundness, and intending subscribers to a loan cannot be too careful in considering the history, especially the recent history, of the house whose name they will have to rely on.

Conversion Loans.—Of late years loans of this class have been numerous, owing to the amount of capital seeking investment having increased much more rapidly than the volume of securities available for this purpose. All the great states of the world and many minor countries have taken advantage of this condition of things to convert their debts from a higher to a lower rate of interest. The method adopted is usually to announce a new issue at the lower rate, to which the holders of the older issues have the right to subscribe in bond on specified terms. If they do not wish to do this they are paid off at par with the money subscribed to the new loan by the public. Sometimes such a conversion fails, through

nearly all the old holders refusing to send in their bonds and the public subscribing nothing, the government having over-estimated its credit. On several occasions the credit of the government has been amply good enough to justify the operation, but its *right* to carry it out has been questioned by holders of the older loans, on the ground of the wording of the bond, which, it is contended, does not permit redemption before a certain date. The contention of the government, in such cases, usually is that the words relating to redemption mean that the loan must be redeemed at the date mentioned *at the latest*. The conversion of the Egyptian preference loan, in 1888, led to a serious dispute of this kind, and in 1894 the conversion of the Turkish tribute loans caused a similar discussion. It was thought that these precedents might reduce the readiness of the public to subscribe to loans in future, except at slightly lower prices, unless a specific pledge were given that the loan would not be redeemed or converted before a certain date. This has to some extent proved true.

Form of Documents of Ownership.—Loans are either registered as stock or are issued in the form of bonds to bearer, with a sheet of coupons attached representing the amounts of interest due half yearly (or quarterly). This last is the form in which the majority of external loans are issued, as such bonds are more widely marketable than registered stock. They are liable to be stolen, however, while certificates of registered stock are of no use *per se* to any one but the rightful owner.

Underwriting.—This term is used to denote an agreement entered into with an issuing house by capitalists who bind themselves to take part of a loan to be issued by such house at a certain price, in case the public do not subscribe for it. The majority of loans of any magnitude are thus "underwritten." The consideration for the service rendered is paid in the form of a commission. If the loan is sold to the public, the underwriters merely pocket their commissions, but if not they have to take up their quotas. In times of speculative activity many people of inadequate means make money in this way, but eventually some of them get caught, the speculative fever of the public having diminished. Many of the embarrassments which followed the financial collapse of November 1890 were due to incautious underwriting.

Issue of loans above or under par.—The decision as to the price at which a loan shall be issued is dictated by various circumstances. In the case of governments whose credit is only moderately good, the usual practice is to sell the loan at less than par, in order to make it more attractive, for a cautious investor who has made up his mind to choose one of two loans at different rates of interest, but yielding the same rate on the capital invested, will almost invariably take that which is under par. Governments in good credit, on the other hand, usually ask at least par for their issues, though this rule is not invariable, as it has, in some cases, been considered worth while issuing at a discount in order to establish a loan at a low rate of interest in the market. The most remarkable instance of this was the persistent issue by the British government of 3 per cents, which, until within the last few years, were usually under par. On the whole the policy has been justified by results, but in most cases unless the discount is moderate the creation of debt, which is only partly represented by the actual receipt of cash, is of doubtful wisdom, the better plan being to borrow at par at a higher rate of interest for a moderate term of years, which enables the country to take advantage of any improvement in its credit by refunding at a lower rate when the old loan matures.

W. H.

LOCAL FINANCE is a subject of increasing importance. The aggregate receipts of the local authorities of England and Wales for 1902-3, excluding receipts from loans, amounted to £93,935,417.

The principal items were :

Public Rates	£50,328,412
Imperial Contributions	12,782,803
Tolls, dues, and duties	4,127,130
Receipts from real and funded property	2,412,144
Sales of property	473,035
Fines, fees, penalties and licences	988,266
Revenue from waterworks	4,184,611
do. gasworks	7,168,705
do. tramways	3,797,758
do. electric works	1,881,265
do. markets, cemeteries, sewage farms, baths, wash-houses, libraries, fire-brigades, lunatic-asylums, hospitals, slaughter-houses, harbours, piers, docks; excluding receipts entered as rates, tolls, dues, etc.	3,940,443
Repayments in respect of private improvement works	1,850,845

The public rates, which constitute nearly the whole of local taxation, are levied upon the occupiers of real property; the sum payable by each occupier being in proportion to the annual value of the lands, premises, etc. occupied. The poor law provides for the assessment and collection of the poor-rate; and with this rate several others, *e.g.* the county council, rural district council, and parish council rates, are collected. The general district and other rates separately collected, are based on the poor-law valuation. There is, however, a reduced assessment of agricultural land, railways, etc. to certain urban charges, and it is suggested that the system should be generally modified in another direction by the levy of special rates for town improvements upon the persons primarily benefited. Financially speaking, the areas of the separate local authorities are independent; but the metropolis occupies an anomalous position — it is an aggregation of authorities whose financial independence of each other is modified by the presence of a common poor fund and an equalisation of rates fund.

The poor rate valuation of England and Wales in April 1904 was £243,061,842; of the metropolis alone £50,117,831. The sums raised 1902-3 represent for England and Wales an average rate of 5s. 7·4d., or £1 : 10 : 6 per head of the population. The average for the metropolis, however, is 6s. 9·6d., or £3 : 0 : 5 per head; for the provinces, 5s. 3·2d., or £1 : 5 : 8 per head. The rates show an increase in ten years of 56·18 per cent, a rate of growth about the same as that of taxation for imperial purposes. In considering further the geographical distribution of the burden, it will be found that the increase is mainly confined to urban districts. In the decade in question the rates rose in the metropolis 53·7 per cent; omitting school and poor rates, those levied by urban authorities increased 61·9 per cent. Those levied by extra-metropolitan poor law authorities increased 42·9 per cent. In addition to local taxation, £12,849,284 was received during the year from imperial taxation, and distributed thus:

County and District Councils .	£5,230,607
Poor Law Authorities . .	2,322,356
School Boards	4,253,139
Metropolitan Police . . .	1,037,854
Other Authorities . . .	5,328
	£12,849,284

Some £9,000,000 of the above arose from certain imperial taxes permanently granted to local authorities, and therefore was not a charge of annual supply, but belonged to the category of charges on the CONSOLIDATED FUND. The expenditure of the surplus from this sum, after meeting certain charges, is within the discretion of the grantees.

The aggregate local expenditure, excluding expenditure out of loans, was £92,882,545. The principal items were:

Relief of the poor, including salaries, but excluding pauper lunatics .	£9,646,440
Pauper lunatics . . .	2,779,759
Police	5,720,038
Education, including expenditure of school boards, school attendance committees, reformatories, industrial schools technical and intermediate education . . .	10,816,038
Highways, street improvements, and turnpike roads . . .	9,955,581
Gasworks . . .	5,381,018
Public lighting	1,992,845
Electricity supply (other than for public lighting) . . .	929,701
Tramways	2,417,711
Waterworks	1,725,075
Sewerage and sewage disposal works	1,961,702
Markets	449,029
Cemeteries	409,511
Fire brigades	475,293
Parks, pleasure grounds, etc. . .	707,543
Public libraries and museums .	473,552
Baths, wash-houses, etc. . .	393,908
Bridges and ferries . . .	278,751
Hospitals	1,602,584
Harbours, piers, docks, and quays .	1,889,235
Land drainage, embankment, river conservancy and sea defence .	£300,817
Other public works and purposes .	6,942,372
Private improvement works . .	1,465,225
Payment in respect of loans *raised for all the purposes mentioned* .	20,287,264
Salaries, establishment, legal and parliamentary expenses not charged to particular undertakings . .	3,886,533

The numerous and increasing duties imposed by parliament upon the local, especially the urban authorities, involves an expenditure which has in the past steadily grown, and which there is reason to believe will continue to increase in the future. Economies must therefore chiefly be administrative. Some supplementary means there are: for example, the making of an annual financial statement or budget by the county councils is compulsory; and the audit of accounts by the central authorities is general, the auditor disallowing any item of account which is contrary to law. Municipal corporations and metropolitan parishes, however, elect their own auditors, and form an important exception. In several instances the rate in the £ which may be levied is limited. It may also be noted that a considerable part of the outlay of urban authorities is upon undertakings of an industrial nature, and that the more important of these usually return a profit.

Scotland.—The receipts of local authorities, excluding loans, are for 1902-3 as follows:

Rates, including water-rates, £819,000	£5,806,000
Gas, £1,841,000, Electric Light, £338,000	2,179,000
Repayment on account of Private Improvements executed by Local Authorities	44,000
Tolls, dues, fees, fines, and rents .	1,477,000
Imperial contributions . . .	2,136,000
Other receipts (including tramways)	1,532,000
	£13,174,000

The expenditure is as follows:

By Unions and Parishes:	
Poor expenditure . . .	£1,235,000
Other do.	79,000
School boards	2,786,000
Burgh authorities . . .	9,588,000
County councils	1,746,000
Heritors for ecclesiastical purposes	58,000
Harbour authorities . . .	1,250,000
Other authorities . . .	25,000
	£16,767,000

Ireland.—Local receipts for 1902-3 were:—

Rates (including water rates) .	£3,007,000
Tolls, fees, stamps, and dues .	463,000
Other receipts	611,000
Imperial contributions . . .	1,327,000
	£5,408,000

The chief items of expenditure were:

By county authorities for police, roads, bridges, lunatic asylums, etc.	£1,596,000

By harbour authorities . . .	£481,000
By poor relief, etc. . . .	1,208,000
By rural district councils, other than above.	485,000
By town authorities for police, sanitary, and other public works.	2,249,000

The varied duties of those engaged in the complex task of local government can be best traced in the annual reports of the local government board. They include the inspection of workhouses, training-ships for poor-law boys, canal-boats, vaccination, adulteration of food, education, the control of motor-cars, municipal waterworks, the housing of the working classes, the care of the unemployed, and incidentally much more.

[Local taxation returns (England and Wales)—(Scotland)—(Ireland)—Reports of the local government board.—Return: *Local Taxation*, 10th April 1893 (168 of 1893).—*Report on Local Taxation*, Scotland (C. 7575 of 1895).—Wright and Hobhouse, *Local Government and Local Taxation*, 2nd ed., London, 1894.—G. H. S.

LOCAL GOVERNMENT. The term "local government," often used somewhat vaguely, is best confined to denote the structure and operations of those smaller bodies which are needed to supplement the action of the central authority. Employed in this sense, it has to be distinguished from federalism, and from the government of COLONIES and dependencies. The organs comprised under the designation "local government" are completely subordinate to the central legislature, but have received a delegated power for their special functions. Owing to the greater size of modern states, this process of delegation, scarcely required in the classical city state (πόλις), has been largely carried out, and is likely to increase in importance. In many cases local legislative or executive powers mark the earlier existence of complete independence, which has disappeared under the gradual CENTRALISATION that has been so prominent a feature in European history. But quite apart from these survivals there has been deliberate and conscious creation of local institutions in most of the chief modern states, and even where older formations have been preserved, they are rather adapted to meet new ends than simply retained as relics of a past condition, as conspicuous examples the English legislation of 1888 and 1894 may be mentioned.

Amongst the reasons for assigning part of the public functions to local bodies, the primary one is the desire to entrust special interests to the persons chiefly concerned. It is on this ground that most of the work of municipal corporations and the similar rural councils has been regulated. The care of roads, the disposal of sewage, lighting and water supply, are obviously matters of greater interest to the inhabitants of each town or district than to the nation at large. It is but just that the cost of particular services should fall on those who benefit by them, and that they should have the direction and management of such works. Another class of duties that may advantageously be assigned to local governing agencies, is that on which rigid and minute supervision is likely to be beneficial. Thus, the management of the English poor law is probably more effective than it would be if placed directly under a centralised authority. Local administrators, from their acquaintance with the particular circumstances, can form a sounder judgment on matters of detail than the best organised central department.

Again, it is often desirable to secure diversity rather than uniformity: the same general function has to be discharged in different ways according to the varying needs of different communities. Special conditions and habits have to be taken into account, and met by suitable arrangements. The concession of liberty to the several localities is the natural and most effective way for attaining this object. Legislation and administrative action proceeding from a local source will not fail to bear the impress of the conditions and special needs of the area for which it was intended. Moreover, room is given for the trial of experiments, and for discovering by the test of experience the merits of several competing methods. The best modes of relieving indigence, or of regulating the drink traffic, are most likely to be discovered by the adoption of different plans by local authorities, leading ultimately to general imitation of the successful ones (cp. Jevons, *Methods of Social Reform*, pp. 266-270).

In constitutional countries a further reason for the diffusion of local government is the promotion of the public education of the citizens, a work in which "local administrative institutions are the chief instrument" (J. S. Mill, *Representative Government*, ch. XV.). Great Britain and the United States afford examples of the high value of the political training obtained by the exercise of "self-government," as opposed to the bureaucratic system resulting from CENTRALISATION (see BUREAUCRACY).

The extent to which this process of devolution can conveniently be carried is limited by the need for attending to the general interests of the nation. All matters of national concern

belong *prima facie* to the central power. General legislation, the national defences, and the more important administrative works are of this class. There is, besides, in many cases, an advantage in the existence of a uniform system, constructed on a single pattern, and directed from a common centre. The higher standard of intelligence and better technical skill at the command of the State is an additional reason for entrusting tasks that specially require these qualities to it, rather than to the smaller divisions.

Though profoundly influenced by historical conditions and by the accidents of recent politics, the division of tasks between central and local government very largely conforms to the principles stated above. Between the different sets of local authorities the same guiding rules are also applicable. "As the county is to the nation, so is the parish to the county," seems to be an approximately correct proportion. The areas of local government, and the subdivisions admissible, are to be determined on these grounds. One peculiarity of local government deserves special mention, viz. the predominantly economic character of its work. Indeed, it is possible to trace a resemblance between the private company and the MUNICIPALITY or COMMUNE. This feature leads to the belief that in the local governing body it is desirable to represent, not persons merely, but the various economic interests. Equal voting power, without reference to the condition and interests of the voter, is a more than questionable arrangement. This becomes very prominent in LOCAL FINANCE. One class of persons determines expenditure, and therefore necessarily the amount of taxation or local debt. Another class has to bear the burden, perhaps without compensating benefit.

In the execution of its allotted work the local authority may err by excess or defect. It may seek to unduly enlarge its functions, and trench on the field reserved for the State, or infringe the rights of individuals; so on the other hand it may fail to discharge its duties, and thus injuriously affect the welfare of the community or some section of it. Undue interference with property or excessive taxation may be given as examples of the former, neglect of sanitary precautions, inadequate or inefficient poor-law administration of the latter error. It is obvious that in a limited area special interests can more readily acquire power, and unpopular persons or groups are more open to oppression. Remedies for such evils are to be found partly in the cultivation of public spirit and the sense of responsibility; but where this fails it is necessary to protect those aggrieved, either by allowing them to seek redress from a court, or by application to a department of the central government, like the Local Government Board in England. The power of the state has, however, to be exercised in many cases in which no individual appears as complainant. The needs of modern society have led to the establishment of a system of inspection and control, limited, however, in its action, and chiefly dealing with poor-law administration (see LOCAL FINANCE). The advantages of centralised and of local government are to a great extent combined by the method of supervision applied by the central government to local activity.

A grave problem in local government is the assignment of suitable divisions. Poor-relief, education, sanitary administration, the maintenance of roads, etc., would appear to be distinct duties calling for the creation of as many separate agencies. Simplicity and uniformity in plan are, however, very desirable. The principle "that in each local circumscription there should be but one elected body for all local business" (Mill, *Representative Government*) is generally sound. English legislation has gone too far in the multiplication of local authorities with intersecting boundaries. In this respect the French system exhibits a marked contrast. The natural opposition between "town" and "country" makes a special form of local government necessary for the former, assuming, in such cases as London, a great complexity. Finally, separate administration is desirable for certain economic matters, such as a DOCK, and a harbour, and arterial drainage, where the chief interest appertains to the class of traders or landowners rather than the community at large. Deviations from the general plan of subdivision should always be justified by some special necessity.

F. B.

LOCAL GOVERNMENT IN THE UNITED STATES. The form of local government in the United States is prescribed by the constitution and laws of each of the several states, each state having thus its own system. However, three general types may be distinguished: the town system, found especially in the New England states; the county system, found especially in the southern states; and the mixed township-county system, found in the central and north-western states.

In New England, the early settlers had mostly come from English towns, were members

of the same religious congregation, and there was among them no sharp line of division into social classes. The necessity of co-operation in much of their work, the danger of attack from hostile Indians, the fact that they had come to America for religious freedom and wished to worship together, kept them grouped into small settlements. It was but natural that their government, partly from tradition, especially from the pressure of local conditions, should be in form a pure democracy, though doubtless men of ability and means had great influence. The form exists to-day.

Regularly, at least once a year, and as much oftener as is needed to carry on well the town business, a town meeting is called by the town officers, the purpose of the meeting being stated in the call. Every grown man who is a voter is entitled to attend, and in the smaller towns the attendance is generally large, though the fine formerly imposed for non-attendance has been abolished.

At this meeting a presiding officer—the moderator—is chosen, and the town clerk acts as secretary. Each voter is entitled to make any motion relating to town business, and to speak. Here all questions relating to town improvements—roads, school-houses, drains, are discussed and acted upon; needed taxes are levied; general regulations regarding town matters, *e.g.* the running at large of cattle, the muzzling of dogs, are made; the reports, made in detail, of the town officers, and their recommendations and estimates for the ensuing year, are heard and acted upon; new officers are elected.

The officers are "selectmen" from three to nine in number, who have the general oversight and management of affairs not otherwise assigned; the town clerk, who keeps the records and registers; the treasurer; assessors who estimate the value of property for purposes of taxation; a tax collector; constables to keep the peace, serve legal papers for the local courts, etc.; a school committee; overseers of the poor; and various other officers as needed, and as suits the pleasure of the meeting. Usually there is a pound master to impound stray cattle, a path master to care for the local roads, sometimes a measurer of wood, sealers of weights and measures, fence-viewers, and others. These officers carry out the will of the town as expressed at the meeting, or as they have been given discretionary power. Within their province they are supreme, no county or state authority having right of control unless by securing a change in the law.

In New England, the county has almost no governmental functions, serving chiefly as a judicial district for certain courts of record; though in some states county officers, usually a board of commissioners, lay out roads connecting different towns, issue certain county licenses, see to the maintenance of county buildings, and care for some few other matters that concern several towns in common. It is noticeable that of late years the importance of the county in New England is increasing. In the main, however, the state is a group of towns.

The early settlers in Virginia, a typical southern state, had received their grants of land as individuals, not as congregations. Many of the estates were large; the county was well supplied with streams, so that access to them was easy. The chief crop was tobacco, for the production of which unskilled labourers working under overseers are fitted. In consequence, negro slaves were soon introduced, and the "poor whites" who were compelled to perform manual labour lost social standing. An aristocratic type of society soon developed. Instead of town meetings, for which the settlement in large plantations at a distance from each other, as well as the type of society, were ill-adapted, a representative parish system developed. The twelve vestrymen, in whose hands most of the local governmental functions were placed, were at first elected by the people; but soon they were granted or took the power of filling vacancies in their own number, and thus established their aristocracy. The minister presided at meetings, and had power of appointment of certain officers; the vestrymen appointed the churchwardens, apportioned parish taxes, acted as overseers of the poor.

Many of the functions exercised in New England by the town were here left to the county. The county was smaller generally than in New England. It was also the judicial district; but the court, besides judicial functions, had generally in the south administrative duties as well. It superintended the repair and construction of roads and bridges, dividing the county into highway districts and appointing local road surveyors. It estimated and assessed and collected the county taxes, cared for county buildings, etc. In later years, especially since the war of the rebellion, the courts have been confined more closely to judicial work, though in North Carolina, Tennessee, and elsewhere they still retain much administrative power, the sheriff, for example, collecting taxes, to the levying of which the judges must consent. In most of the southern states the chief administrative duties are given to a board of commissioners elected by the people, together with generally a county treasurer, auditor, superintendent of education, superintendent of the poor, superintendent of roads, etc. In many of the states the county is divided now into school districts which are in good part self-governing; in some, town government has been introduced. The tendency is clearly toward the adoption of some form of town government.

As the central and western states were settled, the forms of local government adopted

were naturally modelled after those of the states from which most of the settlers had come; but as the population was mixed, the advantages of both plans were seen as well as their weaknesses, and the result has been a mixed form, sometimes called the township-county form. Even those of the older states, situate between New England and the south, *e.g.* New York and Pennsylvania, have a mixed form. In nearly all cases the predominance of the town plan shows that the early settlers were chiefly from New England or from states settled first by New Englanders—for example, Michigan, Wisconsin, Illinois, while the predominance of the county idea is found in those settled chiefly by southerners, *e.g.* Indiana, or by the middle states having a mixed form of local government. Illinois furnishes an odd example of a state in which a compromise was made leaving to each county a choice between the two systems. At first the southern counties chose the county system, the northern counties the town system; but of late years the town system has been adopted in about four-fifths of the counties.

In the main we find two types of the mixed system. In one, *e.g.* in Michigan, the town has a town meeting, as in New England, with similar powers; but instead of a board of selectmen a set of town officers, each with a special function, is chosen, though the supervisor, clerk, and justice of the peace serve as a town board to audit accounts and perform a few other minor duties. The supervisor of each town, however, represents his town in a county board of supervisors that has wide powers. It provides for erection of county buildings, prescribes the form of county records, procures supplies for county officers, levies taxes, settles claims against the county, equalises taxes among the different towns, sets off and organises towns and gives them their names, alters and lays out main roads, and builds bridges, or grants subsidies to small towns to aid them in similar work, and performs many other duties that relate to territory larger than the town. The chief characteristic is the representation of the towns in the board.

In most of the states with the mixed town-county system there is no town meeting, but the town officers are elected to perform independently, under the statute, their duties. Sometimes there are many officers, sometimes, as in Indiana, the one township trustee has great power and performs many functions. In these states the towns are not represented in the county board; but the board, usually of three commissioners, is elected directly by the people, sometimes, as in Indiana, each one particularly representing a special district of the county in which he is resident, though chosen on a general ticket. The powers of the board of commissioners are substantially the same as those of the board of supervisors already described.

The counties have also the usual officers needed for so much administrative and judicial work: clerk, treasurer, registrar of deeds, auditor, sometimes assessor, superintendent of schools, surveyor, superintendent of the poor, sheriff, prosecuting attorney, county judge, judge of probate or county administrator, coroners, the names of whose offices explain their duties. One should also mention in connection with local government in rural districts the villages that have an organisation in many ways resembling that of cities (see MUNICIPALITY—UNITED STATES OF AMERICA). In many states, under general statute, a village of some 250 or 300 inhabitants and upwards, by special vote of the residents, may be organised into a corporate body independent in its local affairs of the town in which it is situated. It elects a president and small council with power to pass ordinances, to levy taxes for local improvements, sewerage, lighting, fire protection, etc., appoint officers to keep the peace and perform other needed functions.

As regards the relations of the local governments to the state, they are all under the constitution and statutes, so that by general laws the legislature may often materially modify their forms, and the county and town officers are often made to serve as state officers in duties for which they are suited by their position, *e.g.* collection of taxes, serving process for state courts, etc. Thus the government is a well-co-ordinated system throughout, with, generally speaking, no conflicting authorities.

J. W. J.

LOCAL OPTION is a phrase recently brought into general use, which, perhaps, had its origin in a letter written by Mr. Gladstone in 1868, in which, dealing with the question of the Permissive Bill, he said that he was disposed to "let in the principle of local option wherever it is found satisfactory." This principle is wider in its scope than that of the old permissive measure, which, if carried, would have permitted the ratepayers from time to time to decide either entirely to prohibit or to leave alone the liquor traffic within their district, whether parish, burgh, or other local area. Local option is applied to such legislation as would enable a majority of the ratepayers of any district either to maintain unchanged, to increase, diminish, or wholly suppress, the houses for the sale of intoxicating liquors. As to the method of exercising these powers, it might be periodically, either by a plebiscite or through a board of representatives elected for the purpose by the ratepayers. The difficulty as regards legislation lies in the

great number of vested interests, as well as in the limitless variety of opinion as to the precise amount of restriction to be employed. Thorough defenders of the existing liquor traffic system in its entirety, however, are few in number. On the other hand, the GOTHENBURG SYSTEM (*q.v.*)—by which municipalities would take over liquor shops and manage them in the interests of the community—has not met with much support in Great Britain; nor has the American high-licence system any considerable body of supporters. At the same time, efforts have been made to restrict the publican's trade. The provisions in Bruce's act of 1872 led the way in this direction.

Local option was first brought formally before parliament in March 1879 by Sir Wilfrid Lawson, but his motion was rejected by a majority of 88. In March 1880 the proposal was defeated by a majority of 114, but three months later, in the new parliament, it was carried by 29. Nothing, however, of a practical nature came of the vote. Another motion was carried in 1881 by a majority of 42, and yet a third one in 1883 by 87. Other important questions intervened to prevent legislation, but it is almost universally admitted that something must be done to give localities practical control over licences. Among various forms of local option put forward, it may be noted that the United Kingdom Alliance desires a power of direct veto, by which the electors of any place might, if they so pleased, veto the issue of all licences for the sale of liquor, and thus prevent the sale of strong drink. One of the great difficulties in the way of practical action has been that of deciding what should constitute a "locality," who should be the constituents, and what should be the necessary majority for abolition. Compensation to those engaged in the trade is another moot point round which controversy has fiercely raged.

In 1892 the number of licensed victuallers in England and Wales was 73,480; beer-house keepers with licences for consumption on the premises, 31,092; and for consumption off the premises, 12,580; being a total of 117,152 public-houses and beer-shops, or one to every 250 of the population; an increase over previous figures. This did not include wine-licences for refreshment-houses, or the wine and spirit licences for consumption off the premises. During 1892 the expenditure of the United Kingdom on spirits, wines, and beer amounted to £140,866,262, or an average of £3 : 13 : 11 for each man, woman, and child. In 1902 the estimates made showed that between 1880 and 1902 £3,654,590,246 had been spent on intoxicating liquors, or an annual average of £158,895,228. In 1902 the expenditure of £179,499,817, or £4 : 5 : 6¾ a head, was smaller than in any year since 1898, when it was nearly £177,000,000. The increase in 1899 over 1898 was £9,000,000, the decrease between 1899 and 1900 £1,000,000, that between 1900 and 1901 £3,330,000, and that between 1901 and 1902 £2,250,000, or a total decrease of £6,500,000 since 1898 (*Parliamentary Returns* and Hoyle's *Statistics*). Convinced of the necessity for coping with this gigantic traffic, the government has on several occasions initiated legislation. In 1890 it proposed to arm the county councils with powers enabling them to reduce the number of public-houses; the compensation scheme, was, however, so vigorously attacked that the government was compelled to abandon its proposals. In 1893, Sir William Harcourt introduced in the House of Commons a bill to establish the control of the liquor-traffic by a popular vote operating through the direct veto, called the Direct Veto Bill, or the Liquor Traffic (Local Control) Bill. It was advanced through its first stages, but the exigencies of public business, and the difficulties it encountered, compelled its withdrawal. The bill was again introduced in the session of 1894, but it did not get beyond its first reading. Sir William Harcourt brought it forward for the third time in 1895, but it was dropped on the overthrow of the Government of which he was Chancellor of the Exchequer. Though local option is in legislative abeyance, it has been urged in the Reports of the Royal Commission on the Licensing Laws 1899, and by the promotors of the Public-House Trust Movement (see LIQUOR LAWS).

G. B. S.

LOCAL TAXATION. See LOCAL FINANCE.

LOCALISATION OF INDUSTRY. By localisation of industry is meant the concentration of different industries in different localities, a phenomenon in its international aspect aptly described in TORRENS'S phrase, "territorial division of labour" (*The Economists Refuted*, 1808, p. 14, quoted by Bastable, *International Trade*, 1887, p. 20). For the economic principle underlying DIVISION OF LABOUR (*q.v.*) finds its fullest expression in this specialisation of particular localities to particular industries—this arrangement of productional activities with special reference to the diverse aptitudes, capacities, and resources of different peoples and places (cp. Cairnes, *Leading Principles of Pol. Econ.*, 1874, pt. iii. ch. i. § i.).

The influence of the special industrial tendencies of different races is naturally most conspicuous as between widely divergent civilisations. But, generally speaking, in the industrial as in other spheres of human activity "nationalities are not disappearing but increasingly developing and characterising themselves" (Flint *Philosophy of History.*

1893, pp. 26-27). *National character* is thus a factor of increasing importance in determining the distribution of the world's industry. It is seen in greatest relief when, as in the case of the Dutch, it triumphs over circumstances seemingly the most adverse. Nevertheless, man's LABOUR (*q.v.*) is more productive in proportion, not as he combats, but as he utilises nature's forces—a truth to which the Anglo-Saxon race itself in its colonising character has done ample homage. And Dutch history, closely interrogated, merely shows, not that physical conditions are unimportant, but that many of the obstacles to industrial development thence arising are relative to the intelligence, energy, and enterprise brought to bear on them. At any given stage in the progress of CIVILISATION (*q.v.*), *physical conditions* have thus, independently of their bearing on character (cp. Marshall, *Principles*, bk. i. ch. ii. §§ 1, 3), an important influence on the localisation of industries, both as between different countries and between different localities in the same country. Under a competitive *régime* commodities tend to be produced "not only by the fittest men but in the fittest places" (Bastable, *Commerce of Nations*, 1892, p. 16). 1. Apart from its influence on the energy of man and the durability of his work, the *climate* of a place determines the nature of its vegetable and animal products, and, therefore, to a certain extent, of its industry. Hence the great trades of the world take place naturally between countries differing widely from each other in climatic conditions. "By means of glasses, hot-beds, and hot-walls," says Adam Smith, "very good grapes can be raised in Scotland, and very good wine, too, can be made of them, at about thirty times the expense for which at least equally good can be brought from foreign countries" (*Wealth of Nations*, M'Culloch's ed. p. 200). 2. *The geographical position* and *water communications* of a country are also important factors in determining its industrial *rôle*. The situation of Britain as regards the great COMMERCIAL ROUTES (*q.v.*), her abounding natural harbours and navigable rivers, have immensely aided in establishing her commercial supremacy. Such advantages, however, are in some degree relative to the economic environment of a particular epoch. "Britain has been in turn a great corn-growing, wool-growing, and coal-producing island; and the changes from one employment to another have been due, not so much to climatic or physical changes, as to the relations of trade in which its inhabitants have stood to other peoples" (Cunningham, *Growth of English Industry*, vol. i. pp. 12-13). 3. *The geological formation* of a country not only affects its superficial features and water supply, but determines the character of the soil and, thus, the nature and quality of the vegetation it supports, as well as the abundance or scarcity of its mineral wealth. These, however, are conditions which do not remain constant under the hand of man (*v.* Sidgwick, *Principles*, 3rd ed. bk. i. ch. iv.).

Within the same country, those elements of economic friction which impede COMMERCE (*q.v.*) and specialisation as between different countries—*e.g.* national prejudice, legislative restraints, differences in language or currency, in custom or law, risk in transport, etc.—are, in modern times, either altogether absent or present only in a modified degree. Here, therefore, the influence of physical causes is naturally more conspicuous. The commercial prosperity of cities like Liverpool and Glasgow, Clyde shipbuilding, Sheffield cutlery, the "lead pencils" of Keswick, even the pottery of Staffordshire, are typical of the influence of natural environment (cp. Marshall, *Principles*, pp. 327-328). But there are many examples of localised industries which cannot be thus accounted for, having had their origin in the now oft-forgotten social, political, and other conditions of a bygone age. Such is the order of things in countries where custom and tradition are still dominant. In England itself up to the time of the INDUSTRIAL REVOLUTION (*q.v.*) the settlements of foreign artisans made under Plantagenet and Tudor direction supplied in the main the key to the localisation of English manufactures (cp. Marshall, *Principles*, p. 328; Nicholson, *Principles*, vol. i. pp. 114-115). Even now, when each locality has to justify its claim at the bar of the keenest competition, cases of this sort are numerous. Some, like the silk weaving of Spitalfields in London, are slowly dying, but others continue to thrive. Indeed, an industry, once firmly established in any place, is often more than compensated for any chance inferiority in respect of physical endowment by the cumulative effect of its *acquired* advantages over would-be rivals, in the matter of (1) business connection based on its established reputation; the commodities of a town or district may win a name for themselves just like those of a single firm, and this is as much a source of income, and of industrial strength, to the inhabitants, as his professional reputation to the lawyer or physician (cp. Sidgwick, *Principles*, pp. 93-94); (2) perfected organisation, with facilities for drawing on abundant supplies of the different varieties of skilled labour (*v.* LABOUR, SKILLED) and of specialised machinery; which, in turn, is closely connected with (3) adequate support from the neighbourhood of (*a*) supplementary industries, which permit of economy of skill, and, by affording scope for the labour of some members of a family, tend to cheapen the labour of the others without lowering their standard of living (*v.* COMFORT, STANDARD OF), (*b*) subsidiary industries supplying the requisite tools and machinery, and furnishing the means

of conveyance and communication (cp. Marshall, *Principles*, p. 330 *seq.*, Sidgwick, *Principles*, pp. 373-4). The locality, however, if it is to retain possession, "must be the first to adapt itself to any new conditions" (Nicholson, *Principles*, vol. i. pp. 116-117). The increasing supersession of hand-made by machine-made lace is steadily concentrating this industry in Nottinghamshire and Derbyshire, at the expense of other English counties, notably Northamptonshire (*Census 1891, General Report*, p. 50). Possibly the most magnificent example at once of cumulative strength and of delicacy of operation is found in the history of the varied influences which have made, and maintain, London the world's "clearing house" (see CLEARING SYSTEM) (cp. Bagehot, *Lombard Street*, pp. 32-35 and ch. iii.; Goschen, *For. Exch.*, 5th ed. pp. 32-37). A powerful localised industry, moreover, while attracting supplementary and auxiliary industries, tends to outbid, and thus repel, industries competing with it for labour or elbow-room (cp. Sidgwick, *Principles*, p. 378). Glasgow, Liverpool, Hull, even Leeds and Manchester are becoming specialised for purely commercial purposes, while the pressure of ground-rent drives the manufactures into the surrounding districts. Owing to this "substitution of business premises for houses" the population of Central London has declined nearly 14 per cent in thirty years (*Census, 1891, General Report*, pp. 14-15). But, to resume, even within the same country the physical conditions of a particular time are clearly not all-powerful in determining the localisation of industries. The face of every old-inhabited country is dotted over with the evidences of a time when not only were the physical conditions, as already noted, other than they now are, but man's power of dealing with them was less than it now is, and, in the economic sense of the term at least (*v.* Bastable, *Theory of International Trade*, ch. i.), the present "nation" was not—"the Norwich merchant who visited London" being "as much of a foreigner there as the man from Bruges or Rouen" (Cunningham, *Growth of English Industry*, vol. i. p. 175).

It is worthy of note, as affecting localisation, that the progress of the industrial arts is perpetually changing the economic import of physical conditions. While charcoal was used in Britain for smelting—as even now in Sweden—and the blast furnaces were worked by water, the iron works were located where timber and water-power were most readily available. But, since coal came into use as fuel, and steam-power was introduced, this industry has become definitely localised in the districts of the north and west, where coal and iron are found together (*v.* Cunningham, *Growth of English Industry*, vol. ii. p. 461, 462). Similarly, the woollen manufacture, which early in the 18th century was widely distributed over England—flourishing chiefly where the raw material was plentiful—has, since the introduction of machinery, become concentrated in the north where power and mechanism are at hand (cp. Hobson, *Evolution of Capitalism*, pp. 26-28). Specialisation, too, implies organisation for EXCHANGE (*q.v.*) and it is in the removal of the barriers—physical, political, and social—which obstruct commercial intercourse that the progress of civilisation has, perhaps, most conspicuously affected the localisation of industries. If we take the history of England as typical, then the contrast is sufficiently striking between the 9th century, with its simple, all but self-sufficing, groups existing in mutually mistrustful isolation, and the complex, highly specialised, industrial organism of the 19th, with its security-based credit organisation, its world-wide connections and sympathies. Naturally, the advance has sometimes been more marked in one of its aspects, sometimes in another. From the 13th century onwards the influence of political and social consolidation is especially notable. As the authority of the central government grew, national life and organisation more and more superseded local or municipal feeling and regulations. "That there should be similar laws, similar customs, similar taxes, similar conditions of business throughout the length and breadth of the land was," says Professor Cunningham, "a very great gain for purposes of internal trade" (*Growth of English Industry*, vol. i. p. 244). But to trace the various steps of the advance is the province of industrial history. Production is no longer carried on with a view to local or even national requirements in the first place, with the merely incidental exchange of a surplus. This extension of the MARKET (*q.v.*) permits of greater specialisation, and, as a consequence, many of the industries which flourished in England when the area of COMPETITION (*q.v.*) was more restricted are now leaving her. Such *e.g.* is the case with certain branches of agriculture and of mining, glove-making, and the manufacture of straw-plait, of linen, and of silk (see *Census 1891, General Report*, pp. 43-57). Thus, evolution of the social as of the physical organism shows us alike "differentiation" and "integration," a greater subdivision of functions between its separate parts—a greater specialisation—on the one hand, and, on the other, a more intimate connection—a greater interdependence (cp. H. Spencer, *Principles of Sociology*, vol. i. 2nd ed. pt. ii.—Marshall, *Principles*, bk. iv. ch. viii. § 1).

[The increasing prominence of localisation in the industrial world is reflected in works on the general theory of *Economics*. The subject is admirably treated, from slightly different standpoints, by Prof. A. Marshall, *Principles of Economics*, vol. i. 2nd ed. 1891, bk. iv. ch. x.—Prof. J. S. Nicholson

Principles of Political Economy, vol. i. 1893, pp. 114-117, 129, 130.—Prof. H. Sidgwick, *Principles of Political Economy*, 3rd ed. 1901, bk. ii. ch. xi.—See also G. LOCK-OUT. This term is contrasted with the term Strike in cases of industrial dispute. A strike is the weapon of the employed, while a lock-out is that of the employers. The masters close their works after a certain day if the men will not accede to their terms, whereas in the case of a strike the men cease from work after a certain day if the masters will not grant their demands. In strictness the term *lock-out* should, no doubt, be employed when the act leading to the dispute originates with the masters, and the term *strike* when the men are the aggressive party; but in practice it is difficult in many instances to determine which party really provoked the quarrel, and either may seek to fasten the responsibility on the other. In this case the term lock-out may be applied by the men to the dispute, while the masters may employ the term strike. Supposing, for example, that the masters give notice of a reduction of wages and the men decline to accede to it, they would still often be described as "striking," whereas the original motion would have come from the masters. Or, again, supposing that the men give notice of an appeal for an advance, and the masters say that rather than accede to the request they will close their works, it is very probable that the newspapers would report that the masters had locked the men out. In conclusion, therefore, it may be said that the use of the terms is not in practice strictly defined, but that the term *strike* is probably more common than that of *lock-out*.

[For books to be consulted see article on STRIKES.] L. L. P.

LOCKE, JOHN (1632-1704), the philosopher, was born at Wrington in Somerset. His father was a country attorney and small landed proprietor, who served on the Parliamentarian side in the civil war, which lasted through Locke's boyhood. Locke was educated at Westminster school, 1646-1652, and at Christ Church, Oxford, where he matriculated as a "Student" in 1652, took his B.A. in 1656 *N.S.*, and his M.A. in 1658. He held various college offices between 1660 and 1665. In 1665 he went as secretary to Sir Walter Vane on an embassy to the elector of Brandenburg, at Cleve. In 1666 he received a royal dispensation, allowing him to retain his studentship at Christ Church without taking holy orders, and studied medicine, but did not take his M.B. till 1675 *N.S.*, and never took his M.D. In 1666 he made the acquaintance of Lord Ashley, afterwards first Earl of Shaftesbury, at Oxford, and in the following year took up his residence with the Ashley family in London as physician and confidential adviser,—though he continued to reside at Oxford from time to time. He acted as tutor to Anthony Ashley, second Earl, negotiated his marriage with Lady Dorothy Manners, and assisted as accoucheur at the birth of the third Lord Shaftesbury (the philosopher), whose education he afterwards superintended. His connection with Lord Ashley brought him into active connection with public affairs. It was probably for Lord Ashley that he wrote an *Essay concerning Toleration*, first published in Mr. Fox Bourne's *Life*, which contains the ideas afterwards developed in his famous *Letters on Toleration* published 1689-1706. Ashley was one of the "lords proprietors" of the colony of Carolina, and *The Fundamental Constitutions of Carolina*, published among Locke's *Works* in 1720, were probably drafted by Locke, though it is only the articles on religion that reflect his own views to any extent. In 1668 Locke was elected a Fellow of the Royal Society, but seems to have preferred the less formal discussions of a small circle of friends. Through one of these discussions, probably about 1670-1671, he first came upon the project afterwards elaborated in his *Essay concerning the Human Understanding*. In his medical pursuits Locke enjoyed the friendship and shared the ideas of Sydenham. In 1672 he made a short tour in France, in the suite of the Countess of Northumberland. When Ashley was made Earl of Shaftesbury and Lord High Chancellor in 1672, Locke became his "secretary of presentations." In October 1673 he became secretary to the council of trade and foreign plantations, which office he retained till 12th March 167$\frac{4}{5}$, but he never apparently received his salary of £500.

From November 1675 to April 1679 Locke was abroad in France, chiefly at Montpellier, mainly for the sake of his health. During part of the time he had charge of a pupil. When he returned to London, Shaftesbury was again in power and office, as President of the Council, and Locke seems to have been occupied in political service for him. During the brief Oxford parliament of March 1681, Locke again occupied his rooms at Christ Church. After

Shaftesbury's arrest in July 1681, Locke's movements and frequent absences from Oxford were clearly regarded with suspicion by political opponents, though there is no evidence that he was directly engaged in the plots for making the Duke of Monmouth king. He left Oxford in the summer of 1683, and after a short visit to Somerset went to Holland where Shaftesbury had died in January 168¾. On 16th November 1684 the dean and chapter of Christ Church, in obedience to peremptory orders from the king —in which Locke was accused of "factious and disloyal behaviour"—deprived Locke of his studentship. Locke's residence in Holland gave him opportunity for literary work. His *Essay concerning the Human Understanding* was written there, and probably the greater part of his *Treatise of Civil Government*. Locke enjoyed the friendship of Limborch, professor of theology among the "Remonstrants" (Arminians), and of Le Clerc. To the former was addressed his *Epistola de Tolerantia*, not published till 1689, when it was almost at once translated into English by William Popple. In Le Clerc's *Bibliothèque Universelle*, one of the earliest literary and scientific periodicals, Locke published his plan for keeping a common-place book (*Methode Nouvelle de dresser des Recueils*) —his first publication, 1686, and an abstract of his *Essay*, January 168⅞. In February 168⅞, Locke returned to England with the Princess Mary and Lady Mordaunt. Through Lord Mordaunt, afterwards Earl of Peterborough, he was offered the post of ambassador to the Elector of Brandenburg and afterwards that of ambassador to Vienna, but declined both on the ground of bad health. He was made commissioner of appeals, and seems to have retained this small office till his death. There is a tradition that Locke himself negotiated the Toleration Act (1689), which, however, fell far short of his views. Unable to endure the smoke and fogs of London, Locke made an arrangement to live at Oates in the parish of High Laver, in Essex —the manor-house of Sir Francis Masham, whose wife was a daughter of Dr. Ralph Cudworth, the Cambridge "Platonist": and, except for occasional residence in London, Oates was Locke's home till his death in 1704.

The *Essay concerning the Human Understanding* and the *Two Treatises of Civil Government* and a *Second Letter on Toleration* were all published in London in 1690. In 1692 he published, anonymously, a tract entitled *Some Considerations on the Lowering of Interest and Raising the Value of Money in a Letter sent to a Member of Parliament:* the date of the dedication is 7th November 1691. The "Member of Parliament" was Sir John Somers, who Locke says had put him "upon looking out his old papers concerning the reducing of interest to 4 per cent, which had so long lain by forgotten." The date of these "old papers" must be 1672, when the exchequer was closed. In this tract of 1692 Locke controverts the view of Sir Josiah Child, that the rate of interest could be fixed at a low rate, say 4 per cent, by law. Locke, though ready to approve of a legal rate of 6 per cent, argues that "generally speaking" the price of the hire of money cannot be fixed by law; and that any attempt to fix the rate of interest below "the true and natural value" can only harass trade and is sure to be defeated by the devices of expert traders. Locke argued against Sir Josiah Child, *Observations concerning Trade* (1668 reprinted 1690) that the example of Holland did not prove that a low rate of interest fixed by law was the cause of national wealth; for in Holland there was no law limiting the rate of interest at all, and the low rate of interest was owing to the abundance of ready money. In the second portion of the treatise, Locke exposes the fallacy in the notion of "raising our coin" *i.e.* depreciating the currency. In 1692 Locke published a *Third Letter for Toleration:* and in 1693 *Some Thoughts concerning Education*, dedicated to his Somersetshire friend Edward Clarke, with whom he had corresponded when in Holland about the education of his children. A second edition of the *Essay*, with alterations and additions, appeared in 1694; and a third edition, which is only a reprint of the second, in 1695. A fourth, with alterations and additions, was published in 1699—dated 1700.

In 1694 Locke became one of the original proprietors of the Bank of England. In the spring of 1695 Locke took a leading part in bringing about the repeal of the Licensing Act, thus securing the principle under which what is called the liberty of the press exists in this country, viz. that every one may publish what he chooses in writing as in speech, without previous licence, but that he must be answerable for it afterwards. Locke is said to have drawn up the paper of reasons expressing the dissent of the Commons from the Lords' amendment, which reintroduced the statute; and, as Locke's friend Edward Clarke was the leading manager on the part of the Commons in the conference with the Lords, the statement is extremely probable. In the same year Locke was able to render another great service to his country. He drew up for the use of the lords justices, who were governing England during the absence of King William on the continent, and who included among them Locke's friends Lord Somers and the Earl of Pembroke, two pamphlets on the currency question: (1) *Some Observations on a Printed Paper entitled, For Encouraging the Coining Silver Money in England, and after for keeping it here* (this pamphlet, now lost, was an answer to Locke's treatise of 1692); and (2) *Further Considerations concerning Raising the Value of Money.* In these, resuming and enforcing the arguments of his

tract of 1692, he combats the proposal of William LOWNDES (*q.v.*), secretary to the treasury, who wished to raise the nominal value of the coins, making the crown-piece 6s. 3d., and so on in proportion, depreciating the whole currency to the extent of one-fifth. "An ounce of standard silver can never be worth an ounce and a quarter of standard silver. Nor can it ever rise or fall in respect of itself." The resolutions which were introduced into the House of Commons by Charles Montague—afterwards Lord HALIFAX,—and carried there, embodied Locke's opinions. The old standard value of silver coins was to be retained *both* as to weight and fineness. In this year (1695) also Locke published his *Essay on the Reasonableness of Christianity as delivered in the Scriptures*, which was followed by *A Vindication of the Reasonableness*, etc., and *A second Vindication* in 1697, in answer to the attacks of John Edwards, who accused him of heresy. The years from 1697 to 1699 were to some extent occupied by Locke's controversy with Stillingfleet, bishop of Worcester, on questions arising out of the *Essay concerning the Human Understanding*. But during these years Locke was also performing, so far as his health would permit, important public functions. From May 1696 to June 1700 he was one of the salaried commissioners in the council of trade and plantations, a revival of the body of which he had been secretary in 1673, and which was the predecessor of both the colonial office and the board of trade of the present day. The commissioners had also to consider questions affecting the condition of the poor. Locke, though in bad health and unable to stay in London, except in summer and autumn, was the most diligent member of the board, and had the most influence in it. His resignation in 1700, owing to increasing infirmity, was reluctantly accepted by the king. Among other duties we find that Locke was specially commissioned "to draw up a scheme of some method of determining differences between merchants by referees that might be decisive without appeal." In 1697 Locke's report on the means of discouraging the Irish woollen industry, and, by way of compensation, encouraging the Irish linen industry, was the report selected from among others and approved by the other commissioners. It is dominated by protectionist principles. In the same year another report of Locke's was adopted—on the employment of the idle or necessitous poor. Special features of Locke's proposals are industrial schools for children, with free meals as a substitute for a money allowance to parents with many children; and equalisation of poor-rates in each city or town, instead of separate rates for each parish.

During the last four years of his life, in his retirement at Oates, Locke was chiefly occupied with a commentary, published 1705-1707 (after his death), on some of the Epistles of St. Paul. A little treatise *Of the Conduct of the Understanding*, intended for an additional chapter in his *Essay*, never received his final revision, and was published among his posthumous works. His last literary effort was a *Fourth Letter for Toleration*, unfinished. He died 28th October 1704.

This sketch of Locke's life, and enumeration of his writings, will have sufficiently illustrated his extraordinary versatility. His *Essay concerning the Human Understanding* makes an epoch in the history of philosophy. He introduced the method, which became prevalent in England and France during the following century, of treating philosophical questions from the standpoint of psychology. Locke's cautious but unsystematic account of the origin and nature of knowledge was developed by Condillac and others into a thoroughgoing materialistic sensationalism, and by Hume into complete philosophical scepticism. By Voltaire and others Locke was regarded as the initiator of common-sense rationalism in opposition to the authority of both ecclesiastical and philosophical dogmatism. Similarly, by his plea for the simplification and diminution of doctrines in religion, Locke became the forerunner of the "Deism" of the 18th century. His writings on toleration did much to advance the cause of liberty of thought on the continent as well as in England. Locke indeed exempts Roman Catholics and Atheists from his tolerance, but on political, not religious, grounds. The Roman Catholic is to be excluded, not because of his belief, or the forms of his worship, but because he is the subject of a foreign potentate; the atheist, because he cannot be a good citizen. But Locke's principle of regarding religious belief as a matter with which the civil magistrate should not interfere became one of the watchwords of "liberalism." His *Treatise of Civil Government* was a philosophical defence of the principles of the revolution of 1688, and its contents came to be accepted as the true exposition of the Whig creed. Its leading ideas, that civil society is based upon a compact for the defence of the rights of liberty and property, and that a people may rebel against rulers who are no longer true to the trust reposed in them, and may change the form of their government—are the same as those formulated by ROUSSEAU in his *Contrat Social*, though Rousseau's logic is more relentless and his language less cautious. The very phrases of Locke's *Treatise*, as well as its ideas, are echoed in the American Declaration of Independence. In practical politics, Locke was the confidant of Shaftesbury in his anti-absolutist policy; he was, it would seem, directly concerned in the negotiations which led to William of Orange coming over to England; he helped the passing of the Tolera-

tion Act—an instalment at least of liberty; he succeeded, where Milton had failed, in bringing about the abolition of a literary censorship; he was a main instrument in giving the country a sound currency. As an educational reformer he was the advocate of many principles that have since been accepted. Amid all these claims to be remembered, it is often forgotten that Locke was a reformer also in medicine, and apparently a practical physician of no mean skill.

Locke's contributions to economic theory are to be found in the tracts on money which have been mentioned above, and in certain passages of his *Treatises of Civil Government*. The first treatise is a criticism of Sir Robert Filmer's *Patriarcha*, written about 1642, but not published until 1680, twenty-seven years after the author's death. Filmer had used the origin of government in the patriarchal family as an argument for absolute monarchy. Locke, in order to refute Filmer's absolutist theories, denies the historical connection between the patriarchal family and civil government. Civil government, Locke argues in the *Second* and more important *Treatise*, results from a compact by which mankind, originally free, equal, and independent, pass from the state of nature into the civil or political state. This original state of nature is not, however, as on the theory of HOBBES, a state of war of all against all, but has a "law of nature" to govern it. By the law of nature man already possesses rights of person and property; and it is for the better securing of these natural rights that government is instituted, and when a government fails to fulfil the purposes for which it was instituted, a change of government, though not to be lightly undertaken, is justified. Locke probably derived his conception of the law of nature largely from GROTIUS and perhaps also from Grotius's follower PUFENDORF, whose *De Jure Naturæ et Gentium* was published in 1672. The only previous writer on political theory on whom Locke expressly bases any of his opinions is "the judicious Hooker"—an authority acceptable to the ecclesiatical party, against whose political theories he had to argue. It is characteristic of Locke's unsystematic method of philosophising, that in his political treatise he makes use of that idea of a law of nature (see JUS NATURALE), which belongs to the same type of thinking that he attacked in his polemic against "innate ideas" in the *Essay*. Locke's own language about the supposed "state of nature" is studiously moderate, but he undoubtedly prepared the way for that idealisation of the state of nature which we find in Pope's *Essay on Man* ("The state of nature was the reign of God," etc.,) and in Rousseau's *Discourse on Inequality* (1754). The use of the idea of "nature" by the PHYSIOCRATS (*q.v.*) and by Adam Smith may also be traced to Locke's influence.

In treating of the subject of property, Locke, it should be observed, is primarily concerned to refute the idea of Filmer that kings have by descent from Adam (presumably according to the English custom of primogeniture!) dominion over all the creatures (see i. ch. 4). "God hath given the world to men in common. . . . Yet every man has a property in his own person. . . . The labour of his body and the work of his hands we may say are properly his. Whatsoever, then, he removes out of the state that nature hath provided and left it in, he hath mixed his labour with, and joined to it something that is his own, and thereby makes it his property" (ii. ch. 5, §§ 26, 27). This theory, which bases property on labour, and which may have influenced but must not be confused with Adam Smith's basing of *Wealth* on labour (*Wealth of Nations*, Introduction), is applied by Locke only to the state of nature. In any given country, the property rights of individuals depend upon the law of the land, *i.e.* on compact (*ibid.* § 35. Cp. Grotius's theory): and thus, though the individual is by nature free to choose what society he will join himself to, he has to submit to the laws about property in any commonwealth of which he becomes or remains a member (ii. ch. 6, § 73). There seems some inconsistency between this acceptance of "consent" as the basis of actual property rights and the theory that government exists for the purpose of defending the natural right of property. Locke would doubtless have solved the contradiction by passing, as he constantly does, from the phraseology of the "law of nature" to utilitarian considerations. Locke is only concerned to prove the advantage of fixed and determinate laws, which may be changed for the "common good," against arbitrary government. His theory of property might be made a premiss for anarchical conclusions: he himself does not apply it in any such way. He fully recognises that "where there is no law, there is no freedom" (ii. ch. 6, § 57). The economic doctrines of Locke's three tracts on money have already been referred to. In his views about interest and about the currency Locke is in harmony with subsequent economic theory. On the other hand he was still completely under the influence of the MERCANTILE SYSTEM, maintaining incidentally, while discussing the other two questions, that the commercial prosperity of a country is to be measured by the excess of its exports over its imports.

D. G. R.

LOCKE ON CURRENCY.—Locke had always a good eye for economical facts; we read in his Journal, for example, how the expenses of the Languedoc canal were met (*Life of Locke* (1829), pp. 53, 55, cp. 272), and how salt was prepared and taxed at Picais (*ib.* p. 61), how the peasants in the Bordeaux country lived, and what wages they got (*ib.* p. 76), what was the mortality of

Paris as compared with that of London (*ib.* 80). His remarks on the comforts of the poorest civilised man as compared with the savage (*ib.* 84-86), are probably the original source of a well-known passage in Adam Smith (*Wealth of Nations*, i. end of ch. i.). His derivation of property from labour was, as he stated it, an original and suggestive idea, even if open to many criticisms; and his political philosophy has had its influence on political economy.

But his best-known economical writings are on currency. His biographer, Lord King, was himself an economist with decided views on the currency (see KING), and he describes Locke's proceedings in this regard with much feeling (*Life of Locke* (1829), p. 240 *seq.*). Before Montague and Somers carried out in 1695 their great reform of the English currency, they had taken Newton and Locke into their counsels. Locke had thought deeply on these matters for twenty years, he tells us, before his pamphlet *Some Considerations of the consequences of the lowering of Interest, and raising the value of Money* (written 1690, published 1691), and that pamphlet was but a new expression of long-formed views. The "Considerations" were drawn out against those who desired to reduce interest to 4 per cent by act of parliament; Locke says that interest will be high when "money"—and he is not always careful to distinguish metal money from loans—is scarce, and parliament cannot make it plentiful, though it can multiply perjury amongst borrowers and lenders, and obstruct trade by bad laws. As for the attempt to keep gold and silver within the country, he says it is an attempt "to hedge-in the cuckoo." He recognises the need of an adequate amount of metal currency in nations having any trade at all; it will be in proportion not simply to the trade but to the "quickness of circulation." "The very same shilling may pay twenty men in twenty days." The nature of the transactions must be considered, and also the habits and necessities of the parties concerned. Money will go further if there are many small payments at short intervals, rather than a few large payments at long intervals. He calculates that "it cannot be imagined that less than a hundredth part of the labourer's yearly wages, one eighth part of the landlord's yearly revenue, and one fortieth part of the broker's yearly returns in ready money, can be enough to move the several wheels of trade, and, how much the ready cash of any country is short of this proportion, so much must the trade be impaired and hindered for want of money" (*Considerations*, Works, vol. ii. p. 15, ed. 1740). The value of money is subject to the same variations as the value of other "consumable commodities." The quantity of ready money compared with the "vent" or the number, of buyers and sellers, determines the value of money (p. 16); and the vent and value depends on the necessity or usefulness of the articles.

The foregoing will be a sufficient sample of Locke's manner. The treatise, though nominally on the currency, is to a large extent a general discourse on the general principles of economics. There is even a hint of the doctrine of rent. "Were all the land in Romney marsh, acre for acre, equally good, that it did constantly produce the same quantity of equally good hay or grass, one as another, the vent of it, under that consideration, being of an equal worth, would be capable of being regulated by law," etc. (*ib.* p. 18). Locke refuses to consider the consumers as worthy of special account: "There are so few consumers," he says (p. 16), "who are not either labourers, brokers, or landlords." It is the labourers he most favours, tracing as he does all value as well as property to labour. His explanation of interest by the analogy of rent has been well said, by Dr. Böhm Bawerk, rather to discredit rent than to vindicate interest; "the unequal distribution brings you a tenant for your land, and the same unequal distribution of money brings me a tenant for my money" (p. 19). The one is as lawful as the other; but there is no more than an analogy; rent does not cause interest or interest rent, they vary differently (pp. 20, 21). On the other hand Locke is physiocratic; he thinks that all taxes fall eventually on the landholder (p. 31). In this treatise and in the appended short observations on a printed paper entitled, "For encouraging the coining silver money in England," Locke maintains boldly what is known as the QUANTITY THEORY of the currency, and he makes little or no distinction between demand for the metal money and demand for loans. He also (p. 33), not very logically, defends a legal rate of interest though refusing to fix it below current rates. As to the coinage, he prefers the new milled silver to the old hammered, but thinks that both will leave us speedily if our seignorage remains nominal, and especially if our foreign balance is against us (pp. 46, 47). The raising of the denomination or the increase of alloy he considers as debasement and fraud (pp. 43, 44). In respect of the standard, he is a silver monometallist, but, with his easy-going inconsistency, would have gold still coined, since, as a matter of fact, it is there and used among us.

"The effect indeed and ill consequence of raising either of these two metals in respect of the other is more easily observed and sooner found in raising gold than silver coin, because your accounts being kept and your reckonings all made in pounds, shillings, and pence, which are denominations of silver coins or numbers of them, if gold be made current at a rate above the free and market value of those two metals, every one will easily perceive the inconvenience. But there being a law for it, you cannot refuse

the gold in payment for so much. And all the money or bullion people will carry beyond sea from you will be in silver; and the money or bullion brought in will be in gold. And just the same will happen when your silver is raised and gold debased in respect of one another, beyond their true and natural proportion (natural proportion or value I call that respective rate they find anywhere without the prescription of law). For their silver will be that which is brought in, and gold will be carried out, and that still with loss to the kingdom answerable to the over-value set by the law. Only, as soon as the mischief is felt, people will (do what you can) raise the gold to its natural value" (p. 51).

"Money is the measure of commerce and of the rate of everything, and therefore 'ought to be kept (as all other measures) as steady and invariable as may be.' But this cannot be if your money be made of two metals whose proportion and consequently whose price constantly varies in respect of one another. Silver for many reasons is the fittest of all metals to be this measure, and therefore generally made use of for money. But then it is very unfit and inconvenient that gold or any other metal should be made current legal money at a standing settled rate. This is to set a rate upon the varying value of things by law, which cannot justly be done" (p. 51). "What then (will you be ready to say) would you have gold kept out of England? Or, being here, would you have it useless to trade, and must there be no money made of it? I answer, quite the contrary. 'Tis fit the kingdom should make use of the treasure it has. 'Tis necessary your gold should be coined and have the king's stamp upon it, to secure men in receiving it that there is so much gold in each piece. But 'tis not necessary that it should have a fixed value set on it by public authority; 'tis not convenient that it should, in its varying proportion, have a settled price. Let gold, as other commodities, find its own rate. And when by the king's image and inscription it carries with it a public assurance of its weight and fineness, the gold money so coined will never fail to pass at the known market rates, as readily as any other species of your money" (p. 52). "There being no two things in nature whose proportion and use does not vary, 'tis impossible to set a standing regular price between them. The growing plenty or scarcity of either in the market (whereby I mean the ordinary places where they are to be had in traffic), or the real use or changing fashion of the place, bringing either of them more into demand than formerly, presently varies the respective value of any two things. You will as fruitlessly endeavour to keep two different things steady at the same price one with another as to keep two things in an equilibrium where their varying weights depend on different causes. Put a piece of sponge in one scale and an exact counterpoise of silver in the other; you will be mightily mistaken if you imagine that because they are to-day equal they shall always remain so. The weight of the sponge varying with every change of moisture in the air, the silver in the opposite scale will sometimes rise and sometimes fall. This is just the state of silver and gold in regard of their mutual value" (*ib.*). "It is the interest of every country that all the current money of it should be of one and the same metal, that the several species should be all of the same alloy and none of a baser mixture, and that the standard once thus settled should be inviolably and immutably kept to perpetuity. For, whenever that is altered, upon what pretence soever, the public will lose by it" (52, 53).

When the government were known to be resolved on the reform of the coinage, William LOWNDES, secretary to the treasury, published his *Report concerning an Essay for the amendment of the silver coins* (dated Sept. 1695) and Locke was invited by Lord Somers, and challenged by Lowndes himself, to answer it. This he did in *Further Considerations concerning the raising the value of money, wherein Mr. Lowndes' arguments for it in his late report concerning "An Essay," etc., are particularly examined* (1695). The reasoning of this second pamphlet is substantially that of the first. There is the same faint tinge of mercantilism—"The other case wherein our money comes to be melted down is a losing trade, or, which is the same thing in other words, an over-great consumption of foreign commodities" (p. 82).—But the cogency of the reply is beyond dispute. There is no doubt that the government were wise in getting rid of the clipped money instead of levelling down the rest to the value of the clipped (see MERCANTILE SYSTEM; RECOINAGES; also HALIFAX, EARL OF (Chas. Montague); and NEWTON).

In 1696 Locke was made a member of the Council of Trade (*Life*, p. 143). His correspondent Molyneux writes to him from Dublin about the proposed bill for the encouragement of the linen manufacture in Ireland (Oct. 4, 1697, *Works*, vol. iii. 591): "I am apt to think that you will have the consideration and modelling thereof at your committee of trade." Locke is one of the economists who have been able to apply their principles to practical politics during their own lifetime. The influence of his political and educational writings has been considered elsewhere. Their bearing on economics, though indirect, is very important, and the same may be said of his general philosophy.

[Locke finds a place in all the chief histories of political economy. Roscher's account is perhaps the most full (*Zur Geschichte der Englischen*

Volkswirthschaftslehre (1851), pp. 93-106). Dr. Lippert's notice of him, in the *Handwörterbuch der Staatswissenschaften*, contains good references to literature. His theory of interest is criticised in Dr. Böhm Bawerk's *Geschichte und Kritik der Zinstheorieen* (1884), pp. 51, 52. Dr. Zuckerkandl examines his "quantity theory" of the currency in his book *Zur Theorie des Preises* (1889), pp. 137-141. For other remarks on this part of Locke's work, see H. D. M'Leod, *Bimetallism* (1894), pp. 25-34.—Miklashevsky, *Money* (Moscow, 1895), pp. 271-274. When Professor Ingram, *Hist. of Pol. Econ.* (1888), p. 54, finds fault with Locke for in any degree connecting lowered interest with gold discoveries, it is fair to remember the argument urged by Cliffe Leslie in his last published paper (*Fortnightly Review*, 1881), in favour of a connection.] J. B.

[Locke's *Complete Works* were published 1714, 1722, etc.; and in nine vols., London, 1853. The *Treatise of Civil Government* has been reprinted in Morley's *Universal Library*, 1884, and bk. ii. also in Cassell's *National Library*, 1889. Many previously unpublished papers of Locke's appeared first in Lord King's *Life of Locke*, 1829), (reprinted in Bohn's Series, 1858); Mr. Fox Bourne's *Life of Locke*, 2 vols., 1876, contains the fullest account of the man and his writings, published and unpublished. Shorter accounts are T. Fowler, *Locke*, English Men of Letters Series, 1880, and A. C. Fraser, *Locke*, Philosophical Classics for English Readers, 1890. Locke's economic theories are discussed in Dr. Bonar's *Philosophy and Political Economy* (1893). See BARBON; ENGLISH SCHOOL; INTEREST; LOWNDES.]

LODLAND, a name sometimes given to land whose tenant was bound "to carry loads or possibly to load waggons," this being one of the various forms of compulsory manorial service.

[Vinogradoff, *Villainage in England.—Domesday of St. Paul's*, 1222, p. 49, with Archdeacon Hale's note, p. lxxvii.] E. G. P.

LOGIC AND POLITICAL ECONOMY. There is a certain alliance between the different sciences usually classed as "moral." In fact, in the earliest efforts at systematic thinking, the different departments of philosophic speculation were not clearly separated, and the more practical problems of ethical and social science were always treated along with purely theoretical questions. But there is perhaps a special reason for considering the connections between political economy and logic. For, of all the moral sciences, political economy has reached the highest degree of systematisation, and yet there remains considerable controversy as to the true logical method appropriate to the science. Hence it is not surprising that the same men have shown interest in the two subjects. This has been especially the case with English writers, of whom WHATELY, MILL, and JEVONS are the most notable. Though Whately's *Lectures on Political Economy* have not made the impression that their marked ability might seem to have warranted, yet any student of his logic must be struck with the ingenuity and aptness with which he enforces the formal doctrines of logic by illustrations of arguments, definitions, and fallacies taken from economic discussions. But, in England, the two writers who have in modern times exerted the greatest influence on economic studies—J. S. Mill and W. S. Jevons—have also been the two most noted contributors to logical theory. Mill narrates in his autobiography (pp. 157-166) his dissatisfaction with those methods of treating social and political questions that were current in his time, and records his prolonged attempts to discover the true method. This led him to work at the logic of the moral sciences, the results of which form the last book of his logic. One of the causes that induced him to search for the most appropriate logical method for political and social investigations was the controversy between James Mill and Macaulay, arising out of the former's *Essay on Government*. The method advocated by Macaulay was purely empirical, and was named by J. S. Mill the "chemical method," because, in his view, it was specially appropriate to such a science as chemistry, in which scarcely any laws were known connecting the properties of compounds with those of the elements of which they are composed. The method of James Mill's essay was, on the other hand, abstract and deductive, the final conclusions being derived from a small number of definitely-assigned postulates, in the deductions from which no allowance was made for causes mutually counteracting or modifying one another: and this J. S. Mill called the "geometrical method." He urged, on the one hand, that it was futile to apply comparative observation and experiment to the complex facts of social life, and, on the other hand, that a science like geometry, which excludes all time-relations and the interference of causes,

was not the type on which sociology should be moulded. He, therefore, looked to mathematical physics as the supreme science that applies a deductive method to phenomena of causation. In his view the principle of the composition of causes underlay the entire procedure of physics. The same principle seemed to him applicable to the various forces at work in shaping the characters of societies and of individuals. But, in his search for distinctions of method, J. S. Mill went farther and, taking a hint from Comte, distinguished the *indirect* from the *direct* application of this form of the deductive method. In the direct method, the investigator, starting from general tendencies expressed in abstract form, proceeds to combine the laws of these tendencies in order to deduce conclusions of successively increasing complexity. In the indirect method, he begins with the data of specific observation, and formulates empirical uniformities which have to be subsequently confirmed or modified by deduction from simple laws acting under known conditions. For political economy J. S. Mill seems to have held that the *direct* deductive method was adequate, but that the indirect method was required for moral and social science in general. In his own economic writings J. S. Mill broke loose still further from the influence of his immediate predecessors —BENTHAM, RICARDO, and James MILL—and reintroduced into political economy a good many of the historical characteristics so prominent in Adam SMITH.

In the case of Jevons we can similarly trace how the course of logical speculation may bear fruit in economic study. Jevons's own account of the general character of scientific method was very closely allied to Mill's special account of the DEDUCTIVE METHOD. He differed, however, from Mill, not only in his conception of the fundamental principles underlying scientific methods, but also in the view that a combination of deduction with induction was required in every science, and not only in the concrete human sciences. Jevons maintained with greater clearness than Mill the thoroughgoing *antithesis* between formal and empirical canons of inference, and at the same time urged the necessity of their *synthesis* in every scientific investigation.

On the formal side Jevons showed a bias towards mathematical modes of thought and expression, and this bias is indicated both in his logical schemes and in his most important contributions to economic theory. On the empirical side, Jevons was strongly impressed with the problematic character of all generalisation from experience; and his conception of the function of hypothesis is illustrated by the conjectural explanation he suggested of the periodicity of commercial crises as connected with that of the sun-spots. But what specially characterised Jevons's view of logical method was the prominence he attached to the combination of formal and empirical principles through the inverse application of the theory of probability. And this conception no doubt inspired his highly suggestive and valuable statistical researches into variations of prices, periods of commercial crises, etc.

[Apart from the above examples of writers equally devoted to logic and to political economy, the connection between the study of the two subjects is more definitely brought out by reference to works on the method of political economy which well-known economists have published, such as: Malthus, *The Definitions of Political Economy.* —Cairnes, *The Character and Logical Method of Political Economy.* — Neumann, "Grundbegriffe der Volkswirthschaftslehre," in Schönberg's *Handbuch.* — Menger, *Untersuchungen über die Methode der Staats-wissenschaften.* — Keynes, *Scope and Method of Political Economy.*—Sidgwick, *Principles*, and *Scope and Method of Economic Science* (address to Brit. Assoc.). — Marshall, *Present Position of Economics* (inaugural address at Cambridge). From such works as these we can appreciate the importance of combining with technical knowledge of the specialities of economic science, a habit of detached thought on the general forms of reasoning.] W. E. J.

LOMBARDS. From the time of Henry III. (1216-1272) to that of Edward III. (1327-1377) companies of Lombard merchants were bankers and money-lenders to the kings of England, and also traded largely in the wool of English monasteries, especially from Cistercian houses. Intercourse with Rome, and the collection of the Pope's taxes, brought to England many Italians, who not only acted as agents of the Pope, but often made loans to the people to enable them to meet the papal demands. And Italian merchants at Rome advanced money in the reign of John to agents of religious houses, and to ambassadors with letters of credit from the king. The enormous cost of the crusades (see CRUSADES, ECONOMIC EFFECTS OF), enabled money-lenders to charge a high rate of interest; (Close Roll, 32 Henry III., shows that the Jews charged 45 per cent.); the censure of the Church and the general opinion respecting usury gave the Jews and Lombards a monopoly. The Jews were protected by the king; the Lombards, to evade the charge of usury, granted gratuitous loans to which was added a sum, nominally the cost of repeatedly sending for payment if the debt was overdue. In 1235, however, Roger, bishop of London, excommunicated them for practising usury, and ordered them to leave his diocese, but he was summoned to Rome in consequence, and the Lombards continued to trade in London, where they built for themselves "nobilissima palatia." Matthew Paris, who speaks of them as "usuarii Transalpini quos Caursinos appellamus," says that the bishops dared not interfere with them

because they called themselves merchants of the Pope, and that the citizens dared not speak ill of them because they were protected by certain great men, "quorum ut dicitur pecuniam ad multiplicandum seminabant Templo Romanæ Curiæ"; but they were so hated as usurers and deceivers of the poor, that, had it not been for their costly mansions in London, hardly one would have stayed in England. Henry III., whose resources were exhausted by the demands of the Pope, pledged his gold and silver plate to Siennese merchants for £550. Lucca merchants sent money from England to Prince Edward in Palestine. The customs, fixed in 1275, were frequently assigned to the company of the Frescobaldi of Florence, who also became keepers of the Exchange and farmers of the New Custom imposed on aliens in 1303. Edward II. paid of his father's debts to the Frescobaldi £56,500, to the Bellardi £1800, to the Bardi £4600, and ordered the barons of the Exchequer to hear suits of the Frescobaldi for debt and to levy their debts as those of the King. In 1309, he granted the citizenship of London, to John Vanne, a merchant of Lucca, with exemption from the duties and taxes which citizenship implied. In 1312, the King writes to the Pope, asking that the Frescobaldi, who have left England for the Roman Court without accounting for the profits of the customs, may be arrested and sent back, but he promises that they shall not forfeit life or limb. The same year the discontent of the people led to the abolition of the New Custom which was resumed in 16 Edward III.; aliens were forbidden to receive customs, and the Frescobaldi were to be arrested until they rendered account. The Lombards, taking advantage of Edward III.'s need of money in the French war, and knowing his resources, charged a high rate of interest and grew very cautious in exacting security. Thus, in 1339, the King writes from Antwerp that he has with great difficulty contracted a loan, falling deeply into usury ("incidentes graviter in usurias"), and that no fees are to be paid to ministers of the Crown until his return, but all money due to the Exchequer is to be sent to him, save only that needed for defence against the Scotch and the sums owing to the Bardi and Peruzzi; four days later he enters into a bond with a merchant of Lucca, by which the Earls of Derby, Nottingham, Salisbury, and Suffolk promise that, if the debt is overdue, they will not cross the sea to England without permission of the great money-lender. But, in January 1345, despite their caution, the Bardi and Peruzzi became bankrupt, Edward III. owing to the former 900,000 gold florins, and to the latter 600,000. The firms had borrowed to lend to him, and when he failed to pay they lost credit, and the failure of other banking-houses followed. Lombards continued to trade in England and to negotiate bills of exchange. In 1361, Walter de Barde was appointed master of the mint at the Tower, and in 1364 of that at Calais. As the English cloth trade developed and less wool was exported, the Lombards imported made goods into England until this was prohibited in the interests of home manufacture. Some of the Frescobaldi and Anthony Cavallari, a merchant of Lucca, were employed by Henry VIII., and frequently appear as the King's debtors, but not as his creditors. After the fall of the great Lombard houses, Englishmen became the king's bankers in their place; this, with the more favourable conditions of commerce, contributed in the 14th and 15th centuries to the rise of English merchants.

LOMBARD STREET, a synonym for the London money market.

[Cp. Bagehot, *Lombard Street.*]

LOMÉNIE, Louis de (1815-1878), a French Academician; known by his works on French society in second half of the 18th century, and especially by his book on the Mirabeau family:

Les Mirabeau, vols. i. and ii. 1879; vols. iii. iv. and v. 1889-1891; the three last volumes left unfinished, and continued by the author's son, M. Ch. de Loménie, deal with the great orator of the French Revolution. Having obtained access to a mass of unpublished papers and letters written by the Marquis de Mirabeau (*q.v.*), the economist, and his brother—a brave and shrewd naval officer, generally known under the name of the *Bailli* de Mirabeau, from his rank in the Order of Malta, commemorated by Carlyle, *French Revolution* as "the worthy uncle,"—M. de Loménie, determined "to attempt, with the necessary documents in hand, the revision of the sentence passed upon the marquis by posterity" (vol. i. p. 349), alluding to the unpopularity which became the latter's lot after his family squabbles and high-handed proceedings against his disgraceful wife and no less disgraceful children. In his impartial, interesting, and pleasantly-written book, M. de Loménie has successfully performed the task he undertook. The marquis certainly entertained and acted on early ideas as to the extent of his *patria potestas* and conjugal authority, but he was a respectable and high-minded man, a title to which the future member of the *Assemblée Constituante* had no claim whatever.

Of the abrupt conversion of the marquis to the

doctrines of QUESNAY (*q.v.*), and his life-long rather idolatrous devotion to the doctor's memory, the second volume gives many details, most of which have since been reproduced in the literature on the subject. Economists will regret that the correspondence between the marquis and his brother, the naval officer who sneered at the reformer Quesnay's post of physician to the king's mistress, was too voluminous to be given in full, instead of extracts only being published (vol. ii. pp. 213-217). E. Ca.

LOMÉNIE DE BRIENNE, ETIENNE CHARLES, COMTE DE BRIENNE (1727-1794):

Was brought up as a priest, became archbishop of Toulon, and in that capacity had a seat in the states of Languedoc. He gave his name to the Canal de Brienne, and became a member of the assembly of notables summoned by CALONNE at Versailles, 22nd February 1787. The public finances were in grave disorder. He vehemently opposed the plans proposed by Calonne, became president of the newly-appointed council of finance in April, and prime minister in August, of the same year (1787). "He had been pronounced by Hume to be the only man in France capable of restoring the greatness of the kingdom" (Rae, *Life of A. Smith*) but he "did much to precipitate the Revolution by his incapacity." The measures by which he proposed to rectify the public finances—a rearrangement of the tax of the VINGTIÈME, and a loan—were rejected by the parliament, and in August 1788 he was dismissed from office to make place for NECKER. The times were turbulent. The treasury was empty. The wealth of the country was in the hands of the privileged classes, and they were exempt from taxation. Thus the government was without resources. It would have required a more powerful grasp than that of Loménie de Brienne to restore order. Though subservient to the revolutionary authorities, he could not escape. He was arrested as a "suspect" during the Reign of Terror, and died in prison.

[Droz, *Histoire de Louis XVI.,—Nouveau Dictionnaire d'Économie Politique*, Paris, 1892.]

LONGFIELD, MOUNTIFORT (1802-1884), Irish judge, was the first professor of political economy at Trinity College, Dublin. A very learned real property lawyer, he was appointed one of the three commissioners under the Incumbered Estates Act 1849; and in 1858, when the landed estates court was set on foot, he became a judge of that court.

Longfield's *Lectures on Political Economy*, delivered in 1833, Dublin, 1834, 8vo, deal mainly with the distribution of wealth, and endeavour to show that the only order in which a correct analysis of the sources of revenue can be carried on is—(1) rent, (2) profits, (3) wages. From this analysis Longfield considers that the logical deduction flows that it is "impossible to *regulate wages generally* either by combinations of workmen or by legislative enactments." "The expense of supporting the labourer in that style which he has been accustomed to consider indispensable to his decent subsistence, has no effect in regulating the price of his labour." He criticises Adam Smith's statement that labour is the measure of VALUE (*q.v.*), and has some acute observations on the probable effects of a low rate of profit. The object of *Four Lectures on the Poor Law*, Dublin, 1834, 8vo, is to bring out the distinction between the two kinds of poor law, the one which aims at improving, by its means, the condition of the labouring classes, and the other, which only concerns itself with bare relief for the destitute. It was just because Longfield realised the evils attached to the former that he was in favour of the enactment of the latter, for fear that at some future time the two should be pressed forward together. The best known of Longfield's writings is the essay he contributed on "Irish Land Tenure" to a volume of *Cobden Club Essays*, London, 1870, 8vo. He also published, 1835, *Three lectures on Commerce, and one on Absenteeism.*

Longfield was second president (succeeding Archbishop Whately) of the Statistical Society of Dublin. He published in its Transactions, besides presidential addresses, papers on the limits of state interference with the distribution of wealth; on the legal impediments to the transfer of land; on banking, and a proposal for an act to issue law debentures in connection with sales in the landed estates court.

[*Dictionary of National Biography*, vol. xxxiv.] H. E. E.

LORD, ELEAZAR (1788-1871), wrote:

Extracts from a letter on National Currency addressed to the Secretary of the Treasury, Nov. 1861 (New York, 1864, 8vo); also *Six letters on the necessity and practicability of a national Currency* (New York, 1863, 8vo), in which he treated of (1) The necessity and measures requisite to the institution of a uniform national currency; (2) the resumption of specie payments by the state banks, and a new trial of the old system.

In 1834 he published an *Essay on Credit, Currency and Banking*, where in nine chapters he treats of the use of credit, a metallic currency, the principles and regulations of the currency, the present banking system and its proposed modifications, bank capitals, the regulations of banking, and a national bank. A. L.

LOTTERIES, CONTINENT OF EUROPE (francs converted as 25=£1; marks as 20=£1; Austrian florins as 10=£1). The first lottery with prizes in money is recorded at Florence in 1530. Lotteries with prizes in goods are stated to have taken place earlier. This form of gambling extended itself in a very short time throughout Italy, nearly all the large Italian towns appearing to have established one or other of these descriptions of lottery by the second half of the 16th century. The form in which it became most popular later on, and which is still in use in several countries, took its origin from a political act at Genoa. At the elections to the great council five names out of ninety had to be drawn every year in that city, and betting began to be carried on on these names; this led to the formal "lotto" or "number" lottery, in which the names were replaced by numbers. The player chooses in this system one or more

from all the numbers (ninety), five of which are drawn out as winners; the prizes he may get are widely different according to his having divined one (simplum), two (ambo), three (terno), four (quaterno), or five (quinterno) of these numbers. It can be played for any sum upwards beyond a certain minimum. The winnings consist in a multiplication of the stake; they are, however, always more or less smaller than the sum which had to be paid according to the mathematical probability of the especial number combinations. There are *e.g.* $\frac{90 \times 89}{1 \times 2} = 4005$ ambos in 90; $\frac{5 \times 4}{1 \times 2} = 10$ of which being drawn in the five winning numbers the mathematical chance is $= \frac{1}{4005} = \frac{1}{401}$. The prizes, however, paid by the states for the "ambo"-gain are only two hundred and forty times (Austria-Hungary) or two hundred and seventy times (Italy) the stake. The chance for a "terno" is $\frac{90 \times 89 \times 88}{1 \times 2 \times 3} = 117 \times 780$; $\frac{5 \times 4 \times 3}{1 \times 2 \times 3} = 10$; $\frac{1}{117} \frac{1}{780} = \frac{1}{11} \frac{1}{745}$. Stakes pay only a sum of four thousand eight hundred times (Austria-Hungary) or five thousand four hundred times (Italy) the stakes. At the end of the 17th and in the 18th century the lotto became exceedingly popular. It was introduced in Vienna (1752), in Berlin (1763), and in twenty-nine other German towns, also in France, Spain, and Belgium. The states perceiving the great profit which was to be made by such an undertaking, established a lottery monopoly nearly everywhere, and always either managed the play themselves or had it managed by farmers, who had to pay a large yearly rent. Soon, however, the moral and economic dangers of the play, which were overlooked at the commencement, became obvious, and the "lotto" scheme was vehemently attacked. To quiet their consciences, governments very often combined the play with charitable purposes. In Spain the expenses of the town hospitals and of other useful institutions were borne by the profit of the lottery. From the year 1777 the farmer of the lottery monopoly at Vienna was obliged to provide a dowry for five young girls, whose names were drawn together with the numbers of the lottery.

As, however, the bad influence of the system became more and more perceptible, lotteries being only games of chance, the aggregate number of players in which are sure to lose a part of their venture, the beginning of the 19th century proved very unfavourable for the lotto. It was replaced in 1810 throughout the greater part of Germany, and a few years later in Spain, by other forms of lottery; and, according to the example of England—where lotteries were not allowed after 1826, one sanctioned by mistake, temp. William IV. (see LOTTERIES, ENGLISH), was cancelled—all state lotteries were abolished in France (1836), in Belgium (1830), and Sweden (1841). The number lottery exists at the present day in Italy, Austria, and Hungary only.

Another chief form of lotteries, the "Class" or "Dutch" lottery, was originated in Holland at the beginning of the 16th century, nearly at the same time as the first money lotteries were played at Florence and in some other Italian towns. In this system, a certain sum is divided amongst a certain number of lots of various sizes (whole, half, and quarter lots) which are drawn in different "series" or "classes." There were always a few large and a great many smaller prizes, the amount of both augmenting with every "class," and the largest winnings being played at the last class. To induce people to play on *all* the series, States do not allow playing for a later class, unless lots have been played, or at least paid for, on all the series that had been previously drawn. For every lottery, two of which are instituted every year, 160,000 lots called *stammlöse* are issued, which are played in seven parts called classes or series. Now the price of the lots is *the same*, about 40 marks (£2) including the tax for every class, though the amount of the winnings augment with the series, 8000 prizes being played in the first, 10,000 in the second, 12,000 in the third, and 65,000 in the last class. Besides this the value of the prizes also greatly increases with the later classes. The smallest prize is 65 marks (£3 : 5s.) in the first, 105 marks (£5 : 5s.) in the second, 155 marks (£7 : 15s.), and 210 marks (£10 : 10s.) in the 4th; the largest 30,000 marks (£1500) in the first, 45,000 marks (£2250) in the second, 60,000 marks (£3000) in the third, and 600,000 marks (£30,000) in the fourth. It would therefore not be natural for any one to play on any but the last class had not the following system been put into force. A lot may be purchased for the price of 40 marks for every class, but this is only the case if the lot is bought at the beginning of the lottery for all the classes at the same time. If any one desires to buy a lot for the second class after the first has been played, he must pay the price for both classes (80 marks); after the second class is played the price is 120 marks, and after the third 160 marks. It would seem, therefore, as if every one who wants to play on the later classes ought to buy the lot for all the classes as well. This, however, is not quite the case. If a lot is drawn, the winner gets besides his prize a lot *without charge*, called *freilos*, for the next class. And as 30,000 lots are drawn in the three first classes, there is a good chance of saving the stake for the following classes and to play on the whole lottery for 40 marks (£2). This possibility is lost, of course, if the lot is bought for all the classes at once. The "class" lottery was introduced with some changes into England

and to the northern part of Germany, but did not attain the popularity of the "lotto" until the first half of the 19th century, when it took the place of the latter in many countries. It was abolished in England in 1816, and soon after in France, Belgium, Sweden, together with the lotto, as mentioned before. There is a "class lottery" at the present day, in the greater number of the German states (Prussia, Saxony, Hamburg, Brunswick, etc.), and in Spain, Denmark, Holland, and Servia.

After these two lottery schemes had been long in use, a third form, the "interest" lottery, was introduced in close connection with the growing want of credit of the states. To be able to get cheap credit the states combined some of their loans with a lottery of this description: the interest paid to the creditors of the state was a much lower one than the market interest of the country, but the bond-holders also shared in a lottery at the same time. The prizes were supplied by the state with one part of the profits, which accrued to it by paying less interest for the loan than it would have paid for the same sum had it not been combined with the lottery.

The great moral and economic mischief caused by lotteries is generally acknowledged. But the influence of the three state lottery systems which we have described is not equally mischievous. There is no doubt that the "number" lottery is the most dangerous. The very small stakes and the enormous winnings that may possibly be obtained, induce the poorest classes (working people, maidservants) to try their fortune, and very often this leads to a "systematical" play, thus absorbing continually a very large part of the income of many poor families. The great variety of the combinations of the numbers excites the imagination, and favours superstition, the interpretation of dreams (dream-books), as well as many swindles. All these evils are very seriously felt both in Italy and Austria-Hungary, where the "lotto" system still exists. The greater cost of the lots of the "class lottery" excludes most people to whom gambling might prove the most dangerous. Besides this the "class lottery" is in some countries, especially in Prussia, regulated in a manner so as to limit the play to the smallest possible circle. The selling of lots is confined to the "Einnehmers" (receivers), appointed by the "state lottery management" from the ranks of comparatively rich merchants, and even so they are very much checked as to the freedom of their transactions by minute restrictions. They have to pay down a deposit of 12,000 m. (£600). Most of the tickets are taken by "well-to-do" people, working people take them comparatively seldom—to an extent, it is estimated, of from 8 to 18 per cent of the whole. The whole class of women servants who play very wildly in Italy, Austria, and Hungary, hardly play at all in Germany. There is the less to be said against the "interest" lottery, because in the worst case the loss here only extends to one part of the interest, the capital always remaining assured for the bondholder.

The profit made by the states through the lottery is considerable. In the budget-year (1894) the gain of Prussia made through the lottery was 9,753,500 marks (£487,675), being 5 per cent of the public revenue; that of Saxony 5,200,000 marks (£260,000), 3 per cent; of Brunswick 1,240,000 marks (£62,000), 10·25 per cent; of Austria 7,486,720 florins (£748,672), 1·22 per cent; of Hungary 2,739,500 florins (£273,950), 0·6 per cent; of Spain 24,000,000 pesetas (£960,000), 2·5 per cent; of Italy 25,000,000 lire (£1,000,000), 2·8 per cent. In these countries, and especially in the smaller ones, the play is universal, and reaches enormous dimensions; in Brunswick, for instance, lots are reckoned to cost every year 60 marks (£3) per head of the public; in Schwerin 17·28 marks; in Hamburg 31·68 marks. The institution, when carried on by the state, is an attraction to many who would not think of gambling under other circumstances. It is not true that, as defenders of the lottery systems (Marcinowsky) have often said, "the rage for gambling" is sure to seek other opportunities when the opportunity of the lottery is taken away. Many facts prove the contrary. In France there was in 1837, the year after the abolition of lotteries, 525,000 francs (£21,000) more money deposited in the savings banks than the year before. In the same way a great increase of the deposits was stated in Bavaria after the lottery had been brought to an end (1861). At Brussels one year after its abolition there were 7837 fewer objects pawned and 3609 more pawns redeemed. All experience in countries where state lotteries have ceased, pleads for their abolition.

Beside the state lotteries, private lotteries occupy a large field in some countries, principally Germany, Austria-Hungary, Italy, Holland, Belgium, and France. They may be divided into two chief forms. (1) Lottery loans, managed after the example of the state interest lottery, with a long duration (generally seventy to eighty years), with series of drawings, the nominal value of the lots being generally paid back successively. (2) Ordinary lotteries (occasion lotteries) with a single drawing, sometimes with prizes in kind. The most common of the first sort of the private lotteries are the great city lottery loans. There are fifteen of these with a nominal value of 2,405,423,460 francs (£96,216,938) in existence at the present time in France; fifteen in Belgium and Holland, 510,416,820 francs (£20,416,673); 8 in Germany, 155,190,000 marks (£7,759,500); 8 in Austria, 263,266,300 florins (£26,326,630); 7 in Italy, 69,317,500

lire (£2,772,700). Some lotteries for charitable purposes, as, for instance, the well-known "red" and "white cross" lotteries, and the great lottery loans of some large banks, principally mortgage banks, are issued in the same manner.

As to the ordinary or "occasion" lotteries, they are arranged for the most different objects. From 1885 to 1893, for instance, 5771 of these have been permitted in Germany, amounting to a nominal value of 140,880,500 marks (£7,044,025), that is, 15,653,390 marks (£782,669) per year, 3020 of which were for charitable, 1652 for agricultural, 270 for art, 276 for church building, 223 for various other purposes. These lotteries need not be condemned if arranged in a manner that only those people should participate in them who take some interest in the purpose of the play, as for instance, the picture lotteries at the great art exhibitions. But in many hundreds of them it is only the dazzling prizes that attract players from all classes, who are rarely conscious of the very small chance of winning, and do not care the least about the object of the lottery.

In the last few years, new laws (*Loossperrgesetze*) have been enacted in Germany and Austria-Hungary, prohibiting the introduction of foreign lotteries and the arrangement of new lotteries, unless authorised by special act of parliament. Some of the minor occasion lotteries can be allowed by government license. It is therefore very probable that there will be, in a short time, a considerable decrease in these countries in which they were until now the most favoured, when the great lottery loans will be brought to an end and new ones will not be allowed.

LOTTERIES, ENGLISH. The first state lottery in England was announced in 1567 to provide funds for the repair of harbours and fortifications. It was officially described as a very rich lottery-general of money, "plate, and certain sorts of merchandises." The greatest prize consisted of £3000 in cash, and the value of £2000 in plate, tapestry, and other fabrics. The prizes were displayed at the house of Dericke, the queen's goldsmith, in Cheapside, and a woodcut was appended to the proclamation depicting a large show of plate; but the 400,000 lots were not quickly sold, as the drawing, according to Stow, did not begin until 11th January 1569. It was carried on day and night, until 6th May, in a building erected at the west door of St. Paul's. The lots cost 10s. each, but could be subdivided. The queen issued a second proclamation, and the lord mayor made an appeal to the people, while the Earls of Pembroke and Leicester, and Sir W. Cecil, wrote, on 30th August 1568, to urge the merchant adventurers to promote the lottery; but the people were distrustful, and the lots remained on hand until Elizabeth characteristically sent scolding missives to the justices of Kent and several other counties, and menacingly appointed an agent to report to her "the former doings of the principal men of every parish" with respect to the scheme. A copy of the original broadside still exists. For this and other interesting details as to this early lottery, see the 7th *Report of the Historical MSS. Com.*, App. pp. 619 *b*-621 *b*.

No lottery followed in the next year. The one for armour, mentioned by Stow, was certainly under royal consideration in 1585, as appears from a letter from the lord mayor to Walsingham, but the queen does not seem to have ventured on a third experiment.

Stow gives, under the year 1612, an account of "a liberall lottery" which James I. granted for the colonies in Virginia. Sixty thousand blanks were cast out on this occasion, as the lots were not fully taken up, but the prizes were not reduced. This is referred to in the *Domestic State Papers* for 1611-18, p. 120, which also mention, p. 130, a proposal for a private lottery, about this date, which was rejected by the lord mayor. The king's council, on 22nd February 1615, recommended another project for a Virginia lottery. A lottery is said to have been held in 1619 at Reading, and licence was given, in 1627, to Michael Parker, and another to raise money by a lottery to carry out the scheme for an aqueduct from springs at Hoddesdon to London. A fresh licence was given to Parker in 1631, and the matter seems to have been taken in hand by George Gage, and much money collected, which, about 1637, still remained on deposit, though the undertaking had failed.

A fresh project appears in the *State Papers* in 1640, when a "standing lottery" was sanctioned, "like that granted to the Virginia company."

Puritanism seems to have permitted the committee for lands in Ireland to hold a lottery at Grocers' Hall in 1653, but the *State Papers* from 1649 to 1659 are silent on the subject. In 1660, however, the mayor of Norwich com-

plained of the "puppet-shows and lotteries" which came with the king's licence and sign-manual, and injured the trade of the town.

A lottery was also granted in 1660 for the ransom of English slaves from the Mediterranean pirates. A private one was asked for in the same year, and licence for a game called *l'oca di Catalonia*, which, as afterwards appears from the *State Papers*, was really a lottery, was granted to F. Corbet, a groom of the queen's privy chamber.

In 1661 a lottery for the fisheries was allowed, and in August 1663 (*8th Rep. Hist. MSS. Com.*, 539) there are traces of the famous Royal Oak lottery. A letter of 1664 (*Dom. S. Papers*, pp. 454-455) shows that the *Oca di Catalonia* was changed into the "Royal Oak."[1]

On 27th January 1664 a royal declaration annulled the former grant to Corbet, who had transferred his rights to Sir A. des Marces and another, who were allowed thenceforwards "the sole exercise of lotteries, for the benefit of the Royal Fishing Company."

This "Royal Oak" seems, from letters among the *State Papers*, to have been carried on in the provinces by travelling agents who obtained the permission of mayors to stay for a specified number of days.

At an uncertain date, but about 1664, Thomas Killigrew obtained a licence to begin when the fishing company's licence, for two remaining years, should have run out. In 1665, however, the company tried for a monopoly of lotteries in England, and, in 1666, for one in Scotland for seven years. They seem to have succeeded, as in February 1667 there is a petition for permission to succeed the royal fishing company in the "sole licence of holding lotteries in his majesty's dominions," which request was granted for three years.

This patent monopoly lasted to the end of the century, the Royal Oak having been excepted from the operation of 10 & 11 Will. III. c. 17, which prohibited all other lotteries.

The government, however, from 1709 to 1825, acted shamelessly in raising large sums annually by lotteries in which the prizes were terminable or perpetual annuities. Contractors took up the tickets and sent itinerant salesmen through the country, who sold fractions of the £10 shares. Minor evils sprang up, as might have been expected, which had to be checked by the acts 19 Geo. III. c. 21, and 42 Geo. III. c. 119, and by Perceval's Act, 1806, which limited the drawings to one day.

In 1736 an act was passed for building Westminster Bridge by means of a lottery of 125,000 tickets at £5 each. This succeeded, and in 1774 the brothers Adam disposed of their property in the Adelphi, by permission of parliament, in a lottery of 110 prizes.

Towards the end of the century lotteries passed into the hands of the chancellors of the exchequer, and an average profit of nearly £350,000 was made for the public purse. Some benefit came from the evil, for the British Museum was aided; but public opinion at last demanded the abolition of the system, which was effected by 4 Geo. IV. c. 60, and the last lottery was drawn in October 1826. Private lotteries had been forbidden by 12 Geo. II. c. 28, and later statutes.

By a strange blunder, lotteries for the improvement of Glasgow were sanctioned by 1 & 2 Will. IV. c. 8, but they were suppressed by 4 & 5 Will. IV. c. 37. The last lottery of which the public has heard was Dethier's twelfth-cake lottery, which was stopped on 27th December 1860. Art unions were legalised by 9 & 10 Vict. c. 48.

[The tragedy as well as the buffoonery of these evil institutions will be found portrayed in Hone's *Everyday Book*, ii. pp. 1404-1535, while the Appendices to the 4th, 5th, 7th, and 8th *Reports of the Hist. MSS. Com.* contribute new and authentic details. See also *Brit. Mus. LOTTIN, Antoine Prosper (1739-1812), was a Parisian bookseller.

He published under the pseudonym of Lambin de Saint Félix an *Essai sur la Mendicité* (Amsterdam, 1779); and, under the pseudonym of M. de Saint Haippy, a *Discours sur ce sujet: Le luxe corrompt les mœurs et détruit les empires*, Amsterdam and Paris, 1784. E. Ca.

LOTTO (see Lotteries, Continent of Europe).

LOTZ, Johann Friedrich Eusebius (1771-1838), a distinguished German economist, was born at Sonnefeld, then in the duchy of Sachsen-Hildburghausen, now belonging to Saxe-Coburg. He studied law at Jena, and held successively several official appointments in his native duchy.

[1] In Catalan Spanish the current term for goose is *oca*. The game of oca does not appear to be played in Spain nowadays, unless it be as a children's game; but it is thus described in the *Diccionario Enciclopedico Hispano-Americano*, Barcelona, Montaner and Simon, vol. xiv. p. 43, 1887 and onwards. "Oca—a game which consists in a series of sixty-three divisions arranged in a spiral ellipse painted on a board or card-board. These divisions represent different objects; every ninth number, counting from No. 1, represents a goose or "oca," and others represent rivers, wells, bridges, ships, or other objects at hazard. The game is played with two dice, and according as the numbers on them come out the game goes on." It would appear probable that the original name of the game may have been *Oca de Cataluna*, and under that name have passed into France, and into England. The game of goose appears to have been well-known in England. Goldsmith in the *Deserted Village* mentions

"The pictures plac'd for ornament and use,
The twelve good rules, the royal game of goose.

In 1819 the university of Bonn offered him the professorship of public law and state economy, which, however, he declined. In 1824 he became privy councillor in the service of Saxe-Coburg, and died at Coburg.

His most important writings were *Revision der Grundbegriffe der National-Oekonomie*, 4 vols., 1811-14, which, though prolix and excessively abstract, is yet, on account of the author's able analysis of fundamental conceptions, such as those of value and price, strongly recommended by Roscher to the careful study of all young economists; and *Handbuch der Staatswissenschaften*, 3 vols., 1820, 2nd ed. 1837, which, though a useful work, is much inferior to the preceding. Lotz was one of those who did most to make the doctrines of the *Wealth of Nations* known in Germany. Allowing for some physiocratic leanings, he belongs essentially to the school of Smith, though differing from him on special points; thus, not labour, in his view, but the creative powers of nature, and of the human intellect, are the great factors in the work of production; he regards Smith as having attended too exclusively to value in exchange, as distinguished from value in use; and he considers his praise of parsimony as too unconditional. He was an earnest reformer, though sometimes misled by a tendency to doctrinaire exaggeration. He treats political economy as a mere theory of enlightened self-interest. As a free-trader he goes even further than Smith, repudiating all intervention of the State in economic life. He chose for the motto of his *Revision* the words: "Ubi libertas, ibi divitiæ," and proclaimed as the one service he desired to render, that of assisting in the removal of the fetters which impeded industry. Perhaps his most serious error is the assertion of the unproductiveness of capital, which, though he was as far as possible from being a socialist, favours socialistic views; regarding this doctrine, however, he appears to contradict himself. His greatest general defect as a thinker is his want of historical sense, with which are connected the too absolute form which he gives to many of his theorems, and the practice of denouncing, as simply erroneous or perverted, ideas and institutions which ought to be treated as the natural fruit of the earlier stages of social evolution.

[Schumann in *Allgemeine Deutsche Biographie*, vol. xix. 1884.—Lippert in *Handwörterbuch der Staatswissenschaften*, vol. iv. 1892.—Roscher, *Geschichte der N.O.*, p. 655 *seq.*] J. K. I.

LOUIS, Dominique, Baron (1755-1837), born at Toul and died at Bry-sur-Marne, was minister of finance during many troublous times, as shown by the dates when he held the post—1st April 1814-20th May 1815 (first invasion); 9th July-26th September 1815 (second invasion); 30th December 1818-18th May 1819 (liquidation of an intense crisis); 30th July-1st November 1830 (Revolution); finally 13th March 1831-10th October 1832 (the ministry of Casimir Perier). On each occasion he showed a practical mind and a rare fertility of resource. Originally an abbé, he left his country when the Revolution broke out. On his return under the consulate, he rose, through the intervention of his friend Mollien, to high positions under government, and was appointed to the council of state, in which office he exhibited great energy. He maintained that a government which possessed the power to fulfil its engagements should unhesitatingly do so, and on one occasion answered Napoleon "a government must pay all it owes even for its follies." Appointed minister of finance at the fall of the empire, he re-established order and restored confidence. Though a supporter of free trade, he did not propose to sweep away all customs duties. When placed again at the head of the treasury, after the fall of the government of the 100 days, he did his best to overcome the innumerable difficulties which arose from the position of affairs.

Resolute but not overbearing, Louis respected the privileges of parliament in matters of public finance. When the *Chambre Introuvable*[1] opposed his broader views he resigned office, which he resumed in 1818 and established the small "*grand-livres*"—a decentralisation of the administration of the consolidated debt to the advantage of the departments. The formation of the retrograde Cabinet of Decazes caused Louis to leave the treasury 19th November 1819. When the revolution of 1830 broke out, the new government recalled him to his post. Here he maintained his high reputation, and after he had for the fourth time left the treasury when the ministry of Jacques Laffitte was formed, he was summoned to it again when Casimir Perier came into power. This was his fifth and last tenure of office. He retired at the age of seventy-seven.

Baron Louis always showed his respect for economic doctrine, and particularly for the famous maxims of Adam Smith on taxation. One of his best known sayings was "Give me a good policy and I will give you good finance." A. C. f.

LOUIS D'OR, History of. This gold coin was first struck in 1640 under Louis XIII., from whom it received its name. Its original value was ten livres: on one side was the head and name of the king, on the other four fleurs-de-lis with the legend, *Christus regnat, vincit, imperat.* The value of the louis d'or was subject to constant variations. Under Louis XIV. it was raised to twenty livres, and at one time to twenty-four. Under Louis XV. the value rose to thirty and even to thirty-six livres. Since the introduction of decimal coinage in 1795, the chief gold coin in France has been the piece of twenty francs. This was usually called a louis d'or after the Restoration and under Louis Philippe. During the second empire it was called a napoleon, but the term louis has survived to the present day in occasional use. R. L.

[1] The *Chambre Introuvable*, elected October 1815, was named thus because Louis XVIII. found it so reactionary in opinion as to be "more royalist than the King," hence it was dissolved in September 1816.

LOUIS D'OR. French gold coin issued during the reigns of Louis XIII.-XVI.

[P. Bonneville, *Traité des Monnaies d'Or et d'Argent*, Paris, 1806.] F. E. A.

LOWE, JOSEPH (early 19th century), wrote: *An Inquiry into the State of the British West Indies* (London, 1807, 8vo) a broad-minded and sympathetic plea for the West India planter. The author advocates a generous colonial policy, and scouts the notion that England has suffered by the loss of America or the Irish union. In a series of five chapters he points out the value of the West Indies as a market for English manufactures, lays stress on the depreciation of sugar, which has caused the emigration of negroes and planters; and proposes, among various other remedies, either the reduction of the duty on that article, or the abolition of the monopoly (see also *Edinburgh Review*, vol. xi. 145). Jevons observes that the idea of the just standard of value described by G. P. SCROPE—see his pamphlet, *An Examination of the Bank Charter Question*, etc., 1833, also referred to as a tabular standard in Scrope's *Principles of Pol. Ec.*, 1833, ch. xvi.,—may have been suggested by the ingenious work of Joseph Lowe: *The Present State of England in regard to Agriculture, Trade, and Finance* (London, 1822, 8vo). In his 7th chapter, the author supports Mr. Simon Gray's as opposed to Malthus's theories of population, and maintains that the increase of our population "is replete with considerations equally satisfactory" in regard to "external" as "internal affairs, the stability of our finances, the reduction of the more injurious portion of our taxes" (see p. 245). Jevons adds that a second edition of this book appeared in 1823; and it was also reprinted (in German) in Leipzig the same year and in New York in 1824. A. L.

LOWE, ROBT. See SHERBROOKE, VISCOUNT.

LOWNDES, WILLIAM (1652-1724), secretary to the treasury, was appointed to that office in 1695. With a view to the recoinage of 1696, he was requested to undertake an investigation into the state of the currency, the results of which were published with the title, *A Report containing an Essay for the Amendment of the Silver Coins*, London, 1695, 8vo. In this important work, while he repudiated any measure which would have the character of debasing the currency, he suggested, as a necessary measure for placing it upon a satisfactory basis, that all denominations of the silver coin should be raised 25 per cent. Lowndes had carefully examined the records of the mint and other documents, and he ably defended his position with historical arguments based upon these materials. He also maintained that the price of silver had risen to 6s. 5d. *an oz.*, and that if the measure he proposed were adopted, persons who melted down the coin would have "less profit by fourteen pence half-penny in the crown." Further arguments he used in support of his scheme were that it would encourage the bringing of bullion to the mint to be coined, and would make the coinage "more in tale, more commensurate to the general need thereof." To meet the objection that people would lose 20 per cent on contracts already made, he maintained the scarcity of silver. He computed the amount of "weighty money" hoarded up at £1,600,000. The most famous of the replies to Lowndes' *Essay* was written by John LOCKE (*q.v.*), and was entitled *Further Considerations concerning the raising the value of money, wherein Mr. Lowndes' arguments for it in his late report concerning "An Essay," etc., are particularly examined.* While the opposition accepted the views urged by Lowndes, Montagu and the government adopted those of Locke, and the recoinage on the old standard was carried on Dec. 10, 1698, in the House of Commons, by 225 to 114. In addition to the part he took in the currency controversy of 1695-96, Lowndes was instrumental in bringing about an amalgamation between the Old and New East India companies. He died in 1724. While replying to Lowndes' *Essay*, Locke paid a high tribute to his ability. "He is a man known so able in the post he is in, to which the business of money peculiarly belongs; and has shewed himself so learned in the records and matters of the mint, and so exact in calculations and combinations of numbers relating to our coin, either already in use or designed by him, that I think I should have troubled the publick no more on this subject had not he himself engaged me in it; and brought it to that pass, that either I must be thought to renounce my own opinion or must publickly oppose his" (Preface to *Further Considerations*, etc.).

[A full account of Lowndes' life is given in the *Dictionary of National Biography*. For a discussion of the relative merits of the views of

Lowndes, Locke, and the other disputants in the currency controversy of 1695-96, and their historical importance, see LOCKE ; RECOINAGES.]

W. A. S. H.

LOYD, SAMUEL JONES (1796-1883), OVERSTONE, BARON, a banker, was the son of a Welsh dissenting minister, who became a partner in Jones, Loyd and Co., a Manchester banking firm, afterwards merged in the London and Westminster Bank. Born to great wealth and an influential business connection, Loyd made the fullest use of his opportunities. He was in the House of Commons from 1816 to 1823, but his importance, politically, lay in the influence which he exercised over successive cabinets and chancellors of the exchequer. Already in 1832 we find him a recognised authority on finance.

The evidence he gave before the committee of the House of Commons on renewing the charter of the Bank of England, was directed (1) against the multiplication of issues of paper money, and in favour of (2) a single bank of issue, (3) a regular publication of accounts, including bullion, and (4) the repeal of the usury laws (see INTEREST). (Preface to 1858 publication of evidence given before 1857 House of Commons Committee upon Bank Charter Act of 1844). In 1840 he had given similar evidence before another committee, when he urged the separation of the departments of the Bank of England. This plan had been supported by the bank directors, Mr. J. H. Palmer and Mr. G. W. Norman, who also gave evidence before the same committee (see BANK NOTE). The Bank Charter Act of 1844 followed mainly upon the lines he had set out, and its provisions were defended by him before committees of the House of Commons in 1848 and 1857. In 1844 he had succeeded his father as partner in the bank, and in 1850 he was made Baron Overstone. He was of course not infallible. His distrust of the joint-stock system of banking (see Bagehot's *Lombard Street*, ch. ix.) was unfounded. On his general currency theory, the opinion of economists is much divided (see CURRENCY DOCTRINE). The disadvantages of the bank act of 1844 are now fully recognised, and various attempts at improvement have been made. Some also will condemn his opposition to the DECIMAL SYSTEM (*q.v.*); but he combined with a complete mastery of the details of banking an active interest in the theoretic side of financial questions, and a singular lucidity in their illustration. He was, moreover, through a long life, the strenuous opponent of all schemes of inconvertible paper. Lord Overstone enabled M'Culloch to edit a collection of *Scarce and valuable Tracts* on (1) *The National Debt and Sinking Fund*, by Harley, Gould Pulteney, Walpole, Hume, Price, Hamilton, and others, London, 1857, 8vo ; (2) *Paper Currency and Banking*, by Hume, Wallace, Thornton, Ricardo, Blake, Huskisson, and others, 1857; (3) *Commerce* by Evelyn, Defoe, Richardson, Tucker, Temple, and others, 1859.—In 1858 M'Culloch edited a volume by Lord Overstone of *Tracts and other publications on Metallic and Paper Currency*, 8vo.—This contains (1) *Reflection on causes and consequences of pressure of money market*, 1837. (2) *Remarks . . . on the condition of issues of the Bank of England and of the country issues during* 1839-1840 ; (3) *Letters to J. B. Smith, Esq.*, 1840 ; (4) *Thoughts on separation of Departments of Bank of England*, 1840 ; (5) *The Petition of Merchants . . . or Bank Charter Act with comments on each clause*, 1847 ; (6) *Letters to the Times* on same, *and on state of Currency in 1855 ;* (7) Extracts from evidence before committee of House of Commons on banks of issue ; and (8) *Extracts from Evidence on commercial distress.*

[*Times*, Nov. 19th, 1883,—*Dict. of National Biography*, vol. xxxiv., and works referred to.]

H. E. E.

LUBBOCK, SIR JOHN WILLIAM (1803-1865), was educated at Eton and Cambridge, and early in life joined the banking and mercantile firms of Lubbock, Forster, and Co., and Lubbock and Co., of which his father, the second baronet of his name, was the head. Business and scientific inquiry, particularly astronomy, the theory of the tides, and mathematics, were his chief occupations. Perhaps the work on *Probability* (1838-1844), written jointly with Mr. Drinkwater Bethune, is the one by which Sir J. W. Lubbock is best known. It was the earliest, and, its size considered, the best of the modern English introductions to the subject. The book was anonymous, but by an extraordinary error of the binder the second edition was lettered on the outside as "De Morgan on Probabilities." Sir J. W. Lubbock did not discover the mistake for years, De Morgan very properly disclaimed it, but naturally did not think it was for him to do more. The business in which Sir J. W. Lubbock was engaged supplied a curious "illustration of the way in which the doctrine of probability applies in every subject. It is a paper contributed by Sir J. W. Lubbock on the clearing of the London bankers. By observation it was ascertained that the daily differences at the clearing house, the money actually wanted to balance the demands of those who are to receive and those who are to pay, is only, one day with another, £29,000. To meet daily contingencies, the banks keep in the Bank of England balances which amount to from two to three millions. Sir J. W. Lubbock recommends that the clearing balance should be paid out of a common fund, which would put the banks so far in the position of being one concern, and would enable them to employ a large part of the sums they must now leave idle. The goodness of the advice is manifest."

Sir J. W. Lubbock's researches in the lunar and planetary theories date from 1832 ; his separate work *On the Theory of the Moon and on the Perturbations of the Planets* was published, the principal portion 1834-1838, with supplementary parts up to 1850. His investigations on the tides and on the heat of vapours and on refraction, 1840, showed high scientific power. Those on the tides did valuable service for navigation,

and some of the tables he devised are believed to be still in use. He contributed nearly a hundred memoirs to the publications of the Royal and other scientific societies, and took an active part in the formation of the British Association. But perhaps the most striking achievement of Sir J. W. Lubbock's life was the vigour with which he maintained scientific study together with devotion to business.

Sir J. W. Lubbock was treasurer and vice-president of the Royal Society, 1830-35 and 1838-1845. He wrote a pamphlet *On Currency*, published anonymously in 1840, and also many anonymous scientific articles besides seventy or eighty memoirs in his own name: for the full list of these see the Royal Society's catalogue of scientific memoirs, 1870, p. 105, and for further particulars see obituary notice in the president's address, 1866.

LUCAS, Charles Jean Marie (1803-1889) a member of the institute of France and inspector of prisons:

He wrote in 1829 an essay on usury *De l'usure considérée dans ses rapports avec l'Économie Politique*, but from the beginning almost entirely devoted his activity to questions of penitentiary reform.—*Du Système pénitentiaire et de la Peine de Mort*, Paris, 1827.—*Du Système Pénitentiaire en Europe et aux États Unis*, 1828-1830.—*La Question Pénitentiaire en Europe et aux États Unis*, 1844.—*Observations sur l'Établissement de la Déportation*, 1853.—*La Peine de Mort et l'Unification pénale à l'occasion du Code Pénal Italien*, 1874.—*L'École Pénale Italienne*, 1877.—*De l'État anormal en France des crimes capitaux*, 1885. He also wrote *Le Droit de légitime Défense dans la Pénalité et dans la Guerre*, 1873, and *La Conférence de Bruxelles sur les lois et coûtumes de la Guerre*, 1874. E. Ca.

LUCK. The husbandman and the merchant are properly represented by Horace as suppliants of fortune. For every *entrepreneur* is an "adventurer," exposed to the whole chapter of accidents which have been indicated under the head of Conjunctur.

The entrepreneur who had produced a commodity, or acquired skill and position, or connection, does not obtain in each particular case a remuneration proportioned to the efforts and sacrifices which he has undergone. Rather his advantage is governed by the law of Rent. And yet it is not a true rent. For the properties which yield it are not "original" (Ricardo), but acquired; and there is a correspondence between the cost of acquiring these properties and their quasi-rent (Marshall); discernible in the long run, though obscured by the action of chance in individual cases. An industry cannot continue unless the prospects of success in it are sufficiently brilliant to elicit the efforts and sacrifices which it costs to embark upon it. The question, how the attractiveness of a business is affected by its riskiness, has been discussed under the head Aleatory.

An average or "normal" correspondence between cost and value being recognised by theory; how large, in fact, are the fortuitous divergences on either side of this position of equilibrium? A gloomy answer to this question is supplied by Prof. Wagner in a passage referred to under Conjunctur. "It is not," he concludes, "personal merit, or one's own fault; it is *not* work, or thrift, or foresight; not idleness or extravagance, or improvidence, but chance (*Conjunctur*) which is the decisive factor in determining the fate of most economic interests." (Compare J. S. Mill, *Chapters on Socialism. Fortnightly Review*, 1879, p. 226). Some of the numerous authorities, cited by Prof. Wagner, countenance the opinion that trade and industry are continually becoming more aleatory. On the other hand, Schäffle holds (*Aussch. Verhält.*, p. 35) that the sphere of chance becomes smaller as that of intelligence becomes larger. The remark is specially true of those calamities which physical science can guard against. But credit-waves and price fluctuations, changeable fashions and migratory customers, new inventions rendering old plant unsaleable, are elements of chance which do not seem to diminish with the progress of intelligence.

Civilisation certainly brings one remedy to insecurity, insurance. The principle is not confined to insurance offices; "when a great company, or even a great merchant, has twenty or thirty ships at sea, they may, as it were, insure one another" (*Wealth of Nations*, bk. i. ch. x.). Antonio having had "an argosy bound to Tripolis, another to the Indies, . . . a third at Mexico, a fourth for England, and other ventures," Bassanio might well ask with surprise: "Have all his ventures failed? What! not one hit!" This sort of insurance is connected by Prof. J. B. Clark with the philosophy of utility in an important article in the *Quarterly Journal of Economics*, 1893. (Cp. art. by John Haynes, *Risk as an Economic Factor*, *ibid.*, 1895).

Co-operation, also, in the modern form of a combination or concert between producer and consumer, should be mentioned as a corrective of the aleatory element in trade. Socialism offers more drastic remedies—themselves perhaps somewhat aleatory. This much certainly may be demanded of governments, that they should not aggravate insecurity by fitful taxation and unstable currency. F. Y. E.

LUCRUM CESSANS, *i.e.* the gain to one person that is hindered by the non-return by another of a loan at the appointed time was recognised as justifying a claim for compensation or "interest," in the early sense of that term, even by some canonists and schoolmen contemporary with Aquinas, though he himself refused to admit it, and in the 15th century it was very generally accepted by the best theologians. They could argue with some force

that the increase of opportunities for reasonably safe investment destroyed the force of Aquinas's argument that damage done could be more readily measured than opportunities missed (see DAMNUM EMERGENS).

[With the Roman lawyers "interest" was the measure of compensation in breach of contract, and this included "lucrum"; see Puchta, *Instit.* (9th ed.), § 260; Windscheid, *Pandektenr.* (7th ed.), § 258. But the term, "lucrum cessans," seems to date from Accursius (d. 1260).—Endemann, *Studien in der romanisch-kanonistischen wirthschafts- und Rechtslehre*, ch. viii., §§ 1, 4; Ashley, *Econ. Hist.*, i. pt. ii. § 65.] W. J. A.

LUDDITES. The riots of 1816, which resulted in the breaking of many knitting frames in Nottingham and the neighbourhood, were deliberately and carefully organised. Those who engaged in them were known as "Luddites," a word derived, it is said, from the name of a half-witted lad, Ned Lud, who (1779) broke a frame under considerable provocation. The condition of the framework knitters was very miserable; the trade was habitually overstocked with apprentices, and there were large numbers of skilled hands, among whom, when trade was bad, a small amount of employment was spread. The riots appear to have been directed as acts of vengeance on certain unpopular masters. The organisation was secret, and in the then state of the law, apart from overt acts of violence, was criminal; those who took part in the operations were bound by oaths, and there appears to have been a close connection between the Luddite riots and the outbreak about the same date of the Shearmen in Yorkshire. Economically, however, the grievances of the two were very different; the framework knitters broke up machinery which had been used with but little alteration for two hundred years; the operations of the Shearmen were directed against the substitution of machine for hand labour in the finishing of cloth. Besides the accounts in the *Annual Register*, the curious may consult Mrs. Linnæus Banks' *Bond Slaves*, an historical novel, founded on personal reminiscences and private information regarding these struggles.

["*Swing*,"—Cobbett, *Letter to the Luddites.*] W. C.

LUDER, AUGUST FERDINAND (1760-1819) was born at Bielefeld, studied at Göttingen, became professor of history at the Brunswick Carolinum 1786, Hofrath in Brunswick 1797, professor of philosophy in the university of Göttingen 1810, and in 1817 honorary professor at Jena, where he died. He was one of the group of economists who were the first to diffuse in Germany a knowledge of the principles of Adam Smith, Kraus and Sartorius being the others. He began his literary career with publications on geography and statistics, and in his principal work on economics, *National-industrie und Staatswirthschaft*, which Roscher calls a paraphrase of Smith's system, he seeks to illustrate the doctrines of the *Wealth of Nations* by means of geography and books of travel. In his *Nationalökonomie oder Volkswirthschaftslehre*, which appeared in 1820 after the author's death, he still follows Smith. He holds that all history speaks in favour of free competition, and maintains—in this going beyond his master—that the interest of the individual can *never* be at variance with that of society at large. He claims to have been the first to reform politics and the historical sciences by developing the influence of industry on intellectual and moral culture, but surely some acknowledgment of Hume was here called for.

Besides his economic writings, and many translations of French, English, and Dutch books on the condition and resources of different countries, Lüder published two works—*Kritik der Statistik und Politik*, 1812, and *Kritische Geschichte der Statistik*, 1817—the object of which was to show the worthlessness, and even the misleading tendency of political theory and statistics, studies to which he had himself devoted much time and labour. He points to the many calculations and predictions of political speculators which had been falsified by the events of his own time; and he succeeds in exposing the superficiality, narrowness of view, and especially the materialistic one-sidedness with which statisticians were often chargeable. But he falls into extravagance in his censures, and carries his scepticism to such a length as would make trustworthy history impossible, because perfect accuracy is unattainable. It may be, however, as some have thought, that even his exaggerations were useful as representing a necessary reaction against the unduly high estimate of statistics entertained by some of his predecessors and contemporaries.

LUDEWIG, JOHANN PETER (1670-1743), a professor of law in the university of Halle, and steady admirer of King Frederick William I. of Prussia.

He principally lectured on German legal and economic history, and published *Germania Princeps* (1702), and in 1709 an Introduction to the monetary history of Germany during the Middle Ages,—*Einleitung zum deutschen Münzwesen mittlerer Zeiten.*—But his most noteworthy work is his *Panegyricus* (1727), written on the occasion of the foundation by Frederick William of a chair of economy, policy, and cameralistic in the university of Halle, emphasising the fact that a sound economic policy is the real basis of military power; the ascendency of Rome in old times, and of France under Henry IV. and Louis XIV., he ascribes to the wise economic policy of their rulers. All their qualities are found gathered in the person of "our anointed Salomo." Quite naturally Ludewig has nothing but words of

blame for historians, who only care about wars, and neglect "great deeds performed at home."

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 356-359.] E. Ca.

LUNACY, Law of. The economic position of the persons and the property of those whose absence of mental power incapacitates them from taking charge of their own affairs, has in England been the subject of numerous statutes during the last sixty years, which, in so far as they remained in force, were all consolidated by the Lunacy Act 1890, amended in respect of some minor details by the Lunacy Act 1891. There can be no doubt that the legislation on the subject has produced excellent results, and that the detention of persons falsely alleged to be of unsound mind or the infliction of inhuman treatment on those who are detained as lunatics, could now but rarely occur. The law as it stands secures (*a*) a competent supervising body having jurisdiction in all matters concerning persons of unsound mind; (*b*) appropriate establishments for the reception of lunatics; (*c*) an efficient investigation of the condition of the patient prior to his reception as a lunatic; (*d*) humane treatment during detention and ample opportunities to be discharged on recovery; (*e*) the protection of the property of persons who are unable to manage their own affairs.

(*a*) *Lunacy Authorities.*—The principal control in lunacy matters is exercised by the lunacy commissioners—a government department consisting of four unpaid, three paid legal, and three paid medical commissioners, one of the unpaid commissioners being the chairman, and of a legally-trained secretary. They have to supervise and inspect all establishments in which lunatics are received, and to see that all the regulations for the welfare of the inmates are properly carried out. They investigate complaints made by persons detained as lunatics, and have wide powers as to directing the discharge of any patients. The jurisdiction as to inquisitions and the management of the property of lunatics is exercised by the Lord Chancellor and the Lord Justices of Appeal, but most of their functions are now delegated to the two Masters in Lunacy, who must be barristers of at least ten years' standing. There are also legal and medical chancery visitors, whose duty is to visit the persons who are found lunatics by inquisition (see below).

(*b*) *Establishments for the Reception of Lunatics.* A lunatic may be detained in one of the following ways:—(1) in an asylum or workhouse, (2) in a registered hospital, (3) in a licensed house, (4) as a single patient. Asylums principally used for pauper patients are provided by counties or boroughs; but they may also receive private patients against payment. A pauper patient may also be detained in a workhouse on a certificate by the medical officer that it is not necessary to remove him to an asylum, and that the accommodation in the workhouse is sufficient; and the county or borough authorities may also send pauper lunatics to hospitals or licensed houses.

An asylum is under the supervision of a visiting committee appointed by the county council or borough council to the jurisdiction of which it belongs. The unions to which the pauper inmates are chargeable have to pay a weekly sum in respect of each patient, the amount of which is fixed by the visiting committee, and may be altered from time to time so as to ensure as far as possible that the receipts cover the expenses, including the salaries of officers and attendants.

Registered hospitals are charitable establishments generally intended for the reception of patients of small means not being paupers, who are admitted free of charge or against a small annual payment; but in many of these establishments there is a separate department for persons paying at a higher rate. Prior to the registration of a hospital the regulations must be approved by the Home Secretary; and it is the duty of the commissioners to see that the regulations are properly carried out. It is a criminal offence for the superintendent of a hospital to receive more patients than the certificate of registration allows. The accounts of hospitals, in so far as they do not come under the jurisdiction of the charity commissioners, must be submitted to the commisioners in lunacy.

Licensed houses are private establishments for the reception of lunatics. The licensees whose licence is dated prior to the Lunacy Act of 1889 enjoy a practical monopoly, as no new licences are granted except to them or their successors in business. The licensing jurisdiction in the metropolis and its immediate neighbourhood is exercised by the commissioners in lunacy; in all other places the licences are granted by the justices of the county or borough in which the house for which the licence is required is situated. A licence states the number of patients it authorises; its duration is left in the discretion of the licensing authority, but must not exceed thirteen months, and it may at any time be revoked by the Lord Chancellor on the recommendation of the licensing authority. The commissioners in lunacy may, with the sanction of the Home Secretary, make regulations for the government of any licensed house. In each county or borough in which the justices are the licensing authority they must appoint at least three of their number and also a medical practitioner to act as visitors of licensed houses within the county or borough.

Single patients received in unlicensed houses are in various ways subject to the control of the commissioners in lunacy.

The average number of patients resident on Jan. 1, 1905, in the various establishments described above was:—

	Males.	Females.	Total.
County and borough asylums	40,155	46,936	87,091
Registered hospitals . .	2,201	1,996	4,197
Licensed houses . . .	1,437	2,244	3,681
With relatives and others .	2,315	3,768	6,083
There were also:—			
In naval and military hosps.	212		212
In Broadmoor Crim. Asylum	562	197	759
In Workhouses . . .	8,287	9,519	17,806
	55,169	64,660	119,829

(*c*) *Detention of Lunatics.*—It is a criminal

offence to receive or detain a lunatic against payment unless the fact of his being of unsound mind has been established in one of the prescribed ways.

When persons have considerable property it is usual to have an inquisition with or without a jury, and if the judge or master in lunacy or the jury find that the patient "is of unsound mind and incapable of managing himself or his affairs," he is placed under the care of a "committee of the person," for which office a near relative is generally chosen. A "lunatic so found by inquisition" may be detained in any establishment for the reception of lunatics or as a single patient, but in all other cases a "reception order" is required. A reception order is either made on petition or on summary process by a justice of the peace, the latter method being adopted in the case of paupers or lunatics wandering at large, and the former in all other cases, and is never made unless two medical practitioners certify independently of each other that the patient is of unsound mind. A reception order is not valid beyond a certain period, unless a report be made by the medical attendant to the effect that the patient is still of unsound mind. It is also necessary for the medical attendant, whenever a new private patient is received, to send a special report to the commissioners in lunacy, and the patient is thereupon visited; and if in such visit it appears that the detention is improper, the commissioners may order his discharge.

In cases of imminent danger patients may be detained for seven days on an urgency order accompanied by one medical certificate. Inquisitions have lately become very rare, and most patients are now detained under reception orders.

(*d*) *Treatment of Lunatics.*—The proper treatment of persons of unsound mind is provided for in various ways, particularly by the compulsory visits which must be paid to all establishments in which lunatics are kept by the commissioners, and, as regards lunatics coming under their jurisdiction, also by the chancery visitors, visitors of licensed houses, and asylum visiting committees.

It is also provided that every hospital and licensed house may at any time, by day or night, be visited by any one or more of the commissioners in lunacy. There are also various provisions for ensuring the right of every person detained as a lunatic to communicate with the lunacy authorities and to receive visits from his friends; for securing regular medical attendance; for regulating the use of mechanical means of restraint; and for facilitating the discharge of patients after recovery. The commissioners in lunacy publish annual reports about their visits and other matters coming to the notice of their department.

(*e*) *Property of Lunatics.*—The property of lunatics so found is placed under the care of a "committee of the estate," who may be the same person as the "committee of the person" (see above). It is now also possible to obtain powers of management as to the property of persons of unsound mind not being lunatics so found by inquisition. The committees and other persons who manage the property of lunatics are under the control of the lunacy judges and of the masters in lunacy (see above).

[The Lunacy Acts 1890 and 1891; see also the Reports of the Select Committees appointed to inquire as to the Treatment of Lunatics, dated 1859, 1860, 1877, 1878. As to the state of the law prior to 1845 see Dr. Forbes Winslow's edition of the act of 1845; see also INTERDICTION.] E. S.

LUNDINARIUM or Mondayland, a name often found in manorial records for the small plots of land held by cotters, the lowest class of villeins, who were bound to work for their lord only on one day in the week, generally Monday.

[Vinogradoff, *Villainage in England*, 1892, pp. 153 note, 256, with references to cartularies of Christchurch Canterbury, and of Gloucester.] E. G. P.

LUNETTI, VITTORIO (17th century); born at Naples, of Genoese descent. He wrote on the commercial side of political economy, and carried on the discussion on the serious state of affairs—economical, monetary, and financial—in the kingdom of Naples—a discussion in which De Santis, Serra, Biblia, and Turbolo had taken part. To meet the exceptional scarcity of coin and the high rate of exchange then ruling in Naples, he proposed to establish a fixed equitable rate of exchange and to forbid the export of coin. He desired to abolish customs and duties and to leave imports and exports free, but at the same time would restrict the privilege of trade in grain to the government. His writings as a whole, compared with those of his predecessor, Antonio SERRA, are not of first-rate importance. Serra had previously discussed, with considerable acumen, the question of international payments, advocating free export of money and free exchange.

Lunetti's works are: *Politica mercantile: degli espedienti et arbitrii per publica utilità*, etc., Naples, 1630.—*Ristretto dei tesori di tanti utili ed incredibili avanzi che si avra con la esecutione della Regia Tavola nella fedelissima città di Napoli*, Naples, 1660.

[For Lunetti, see L. Cossa, *An Introduction to the Study of Pol. Econ.*, translated by Dyer, Macmillan, 1893.—U. Gobbi, *L' economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, 1889, pp. 318-326.—T. Fornari, *Delle teorie economiche nelle provincie Napolitane*, Milan, 1882, vol. i. pp. 293-301.] U. R.

LUPO, GIAMBATTISTA (16th century). A scholastic theologian of San Gemignano, Tuscany, who wrote a Latin work on usury in which he discusses that question, expounding the traditional reasons for its prohibition and the exceptions rendering it permissible. Lupo differentiates between the various forms of usury, and examines various contracts—especially those of exchange, to show at what point they cease to be lawful and become usurious; he maintains that, when in doubt, the judges are not to assume usury. In Lupo's comments

on the scholastic theory of just price (see JUSTUM PRETIUM), which contain some of the germs of the present theories of value, he divides just price into "naturale" and "legitimum."—Natural price is that which usually prevails in the place and time where a contract is made ; it depends on the conditions of place, time, and custom of the contractor, on the quantity of goods and money, buyers and sellers, etc. "Tantum valet res, quantum vendi potest." The law of demand and supply is evidently referred to here. Lupo further says that legitimate price is fixed by the law of a prince or of those in like authority. Whoever fixes it must consider the intensity of the need, the copious supply or scarcity of the article and of the labour employed in its production, the disagreeableness of the business, the changes for better or worse in the goods, etc. Finally legitimate price must be based on natural price. Lupo divides "just price" into maximum, medium, and minimum.

Lupo wrote : *De usuris et commerciis illicitis*, Venetiis, apud Giuntas, 1577.

[See Gobbi, *L' economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, Hoepli, 1889.—Montanari, *Contributo alla storia della teoria del valore negli scrittori italiani*, Milan, Hoepli, 1889.] U. R.

LUSHBOROUGHS, OR LUSSHEBOURNES, were imitated English pennies, or sterlings, coined abroad, to be distinguished from crocards, pollards, and other prohibited coins, which were genuine foreign coins, but imported into England in the 13th century as being of less weight and value than the English sterlings. In most instances even lusshebournes need not be regarded as counterfeit coins ; though the reverse was always more or less closely copied from the English sterling, the obverse usually bore an honest legend, the real name of the prince who issued them, and of the town where they were minted. More often than not, however, the portrait followed the type used by one or other of the English kings, chiefly the three Edwards, but the portrait itself was not seldom absent and replaced by some local symbol. The cross of the reverse was never omitted, and was generally accompanied by the pellets of the English type, though in the place of these it is not uncommon to find letters, or trefoils, roses, birds, or other ornaments, and occasionally the angles of the cross are left unfilled. It is the reverse by which these foreign coins are identified. They were generally of less value than the English original.

These "counterfeit sterlings" had a wide circulation. Public and private interests were alike served. An international currency, even imperfect, was advantageous to trade, and lords and bishops found the advantage of coining money which was acceptable beyond the narrow limits of their domains. As that money which had the best credit was most likely to be imitated, and as much of the trade of the Low Countries was with England, the English sterling naturally became the type of the foreign imitations. The Low Countries were the chief centre of trade, and the chief issuers of sterlings, the circulation of which was favoured by the political alliance of the Flemings with the first and third Edwards.

The sterlings of Hainault, Namur, Cambrai, and the Flemish provinces proper must especially be regarded as a *bonâ-fide* coinage, but the case is different with Luxemburg, where real counterfeits were issued, and from which the English appellation for these foreign sterlings was derived. Luxemburg, or the corruptions lusshebourne and lushborough, became a popular name for all imitated or false coins. The sterling type reached Luxemburg towards the close of the 13th century through Brabant, and some were issued by the Count Henry, afterwards the emperor Henry VII. His son, John the Blind, 1309-1346, minted false sterlings of inferior value, with the name, or some misspelt approach to the name, of the English king, or with some other alteration of the legend with intent to deceive.

Not many foreign sterlings were struck after the third quarter of the 14th century, but they continued in circulation altogether for more than two centuries in spite of the attempts made in England during Edward III.'s reign to stop their introduction. English merchants made their profit out of the importation of them. In 1346 lusshebournes were worth only 8s. a pound, or even less. An ordinance forbade their introduction under heavy penalties, yet the next year several merchants were put to death or fined for bringing them in. The Statute of Treasons, 1352, made the introduction of lucynburghs treason, yet Langland in his *Piers Ploughman*, written about 1362, and Chaucer in the *Canterbury Tales* (Monk's Prologue), written after 1386, both use lusshebourne as a word familiarly known.

The following are the principal places at which foreign sterlings were minted :

Brabant, Bonn, Bremen, Cambrai, Cologne, Flanders, Hainault, Holland, Liège, Lorraine, Louvain, Luxemburg, Maestricht, Mainz, Metz, Namur, Strasburg, Trèves, Utrecht. Chantard gives plates of coins minted at forty-two other places, chiefly German and Flemish, besides the English issues of Aquitaine and Calais, and a few specimens from more distant parts of Europe,—Aragon, Castile, Majorca, Norway, Portugal, and Sweden.

[The fullest account is given by Chantard, *Imitations des Monnaies au Type Esterlin*, 1871, —See also Snelling, "View of Counterfeit Sterlings," in his *Miscellaneous Views*, 1769.—Ducange, *Glossarium*.—Knyghton, *Chronicle*, an. 1347.—Ruding's *Annals*, i. 22.—*Numismatic Chronicle*, 1st. ser. vi. p. 76, 1844.—Pike's *Hist. of Crime*, i. 267, with ref. to *Controlment Roll*, m. 66. Yorkshire, for case of prosecution.] E. G. P.

LUTHER, MARTIN (1483-1546), the German reformer, is an interesting figure in economic history, both because he gave forcible expression to a large body of contemporary opinion, and also because he exercised a distinct influence on the action and thought of his time. A trained theologian, he was conversant with the economic teaching of the fathers, the greater schoolmen, and the earliest canonists: a man of warm sympathies, he had a keen sense of social evils around him, and was ready to apply the lessons of the church with but little regard to practical difficulties: a peasant's son, he looked with peculiar distrust upon the trading class, and regarded the great centres of commerce as but little better than "robber-towns." He shared in all the popular notions of his time; attributed the rise in prices to monopoly and the new great trading companies; thought that the import of foreign wares, like English cloth, was robbing the land of its gold and silver, and would soon leave it penniless; and held that men who were ready to work ought to marry young, and leave it to God to provide for their offspring. In economic thought his influence was probably felt most strongly in relation to usury. Like others among the reformers, he helped to bring about a temporary reaction towards the severer doctrine of earlier centuries; he expressed himself in more sweeping terms than the theologians of the previous generation, and, in particular, expressed his disapproval of certain views with regard to INTEREST, in its narrower and original sense, and "rent charges" (Rentenkauf), which were already coming to be widely accepted. It is not unlikely that the example of the protestant divines contributed to bring about the similar temporary reaction in the Roman Catholic Church during the "counter-reformation." His influence in another direction may be praised with less qualification. He pointed the way to the establishment of a wise system of poor-relief, based on the three principles that mendicancy should be prohibited, that each town should be responsible for its own poor, and that there should be proper investigation by the parson and other qualified persons. In his constitutional and social views Luther was intensely conservative; he regarded the PEASANT'S REVOLT as likely to produce anarchy, and he had no scruple in urging the princes to resort to severe methods of repression.[1]

[Luther's most important writings in this regard are, *Der Grosse und Kleine Sermon von Wucher* (1519), *An den christlichen Adel deutscher Nation von des christlichen Standes Besserung* (1520), *Ordnung eines gemeinen Kastens* (1523), *Von Kaufshandlung und Wucher* (1524), *An die Pfarrherrn, wider den Wucher zu predigen* (1540). For an abstract of his utterances, with typical specimens, see H. Wiskemann, *Darstellung der in Deutschland zur Zeit der Reformation herrschenden nationalökonomischen Ansichten* (1861), which needs, however, to be supplemented by the references scattered through G. Schmoller's *Zur Geschichte der nationalökonomischen Ansichten in Deutschland während der Reformationsperiode* (1861). Neither of these writers, indeed, sufficiently indicates Luther's relation to the previous teaching of the church.] W. J. A.

LUXURY is defined as the consumption of commodities which are not necessaries (*Wealth of Nations*, bk. v. ch. ii. art. iv.). "By necessaries I understand," says Adam Smith (*loc. cit.*), "not only the commodities which are indispensably necessary for the support of life, but whatever the custom of the country renders it indecent for creditable people, even of the lowest order, to be without. A linen shirt, for example, is, strictly speaking, not a necessary of life. . . . But, in the present times, through the greater part of Europe a creditable day-labourer would be ashamed to appear in public without a linen shirt." A more precise definition of luxury is derivable from Prof. Marshall's use of the term "necessary." "The income of any class in the ranks of industry is below its *necessary* level when any increase in their income would, in the course of time, produce a more than proportionate increase in their efficiency" (*Principles*, bk. ii. ch. iv.). Whether a particular article is necessary, in either sense, depends upon habits and climate. A definition of luxury irrespective of those circumstances is unattainable. However, the description given by Butel-Dumont "jouissances superflues" is sufficiently accurate for the expression of the principal economic theories on the subject.

Modern economists, unlike ancient philosophers, do not denounce luxury. Hume maintains that "the increase and consumption of all the commodities which serve to the ornament and pleasure of life are advantageous to society; because at the same time that they multiply those innocent gratifications to individuals they are a kind of storehouse of labour which, in the exigencies of state, may be turned to the public service" (*Essays*, pt. ii., Essay 1-2 *Of Refinement in the Arts*, and compare Essay 1, *Of Commerce*). M'Culloch dignifies as productive any gratification, however trivial,—*e.g.* "blowing soap-bubbles"—to attain which a person is stimulated to work. J. S. Mill looks rather to the educational effect of luxury. "To civilise a savage he must be inspired with new wants and desires, even if not of a very elevated kind, provided that their gratification can be a motive to steady and regular bodily and mental exertion" (*Pol. Econ.*, bk. i. ch. vii. § 3). "The opening of a foreign trade . . . sometimes works a sort of industrial revolution . . . inducing those who were satisfied with scanty comforts and little work to work harder

1 Luther "anticipated A. Smith's proposition that labour is the measure of value."—Cliffe Leslie, *Fortnightly Review*, July 1875.

for the gratification of their new tastes, and even to save and accumulate capital for the still more complete satisfaction of those tastes at a future time" (*Ibid.*, bk. iii. ch. xvii. § 5). Moreover, a "stock of labour" employed in manufacturing luxuries may supply men (Hume, *loc. cit.*), or at least money, for the maintenance of fleets and armies. It has been said that Napoleon was crushed by the English manufacturers. In case of famine, too, labour usually employed in procuring luxuries may be diverted to the production of necessaries; directly, or in exchange for exported manufactures. Another sort of provision against a national disaster is constituted by luxury in the form of precious ornaments (cp. Adam Smith, bk. ii. ch. iii., concerning expenditure on "durable commodities"). Luxury not only remedies an occasional deficiency in the food supply of a people, but also prevents population increasing in excess of subsistence, by forming a standard of comfort below which prudence forbids to populate (Senior, *Lectures on Population*, J. S. Mill, *passim*, and other classical economists). So various are the benefits of luxury. So truly does Voltaire say of modern society: "Le superflu, chose très nécessaire."

Because economists do not follow the ascetic moralists in denouncing luxury, they do not therefore follow MANDEVILLE in applauding "the unmixed prodigality of voluptuous and heedless men" (*Fable of the Bees*, remark *k*). The celebrated dictum, "Private vices public benefits," is plausible only when applied to the extravagance of a particular class. The question is whether the expenditure of the "unnecessary" wealth of the upper classes is more beneficial to the working class than other ways of dealing with that wealth: which are principally—destroying it, investing it, giving it away.

Pace Fawcett (*Manual*, bk. i. ch. iv. p. 23, 4th ed.), destroying wealth is worse than giving it to workmen in exchange for some service, however futile. Investment tends (*a*) to increase the amount of fixed capital, or more generally to diminish the amount of waiting between effort and fruition; (*b*) to increase the remuneration of labour. The first tendency (*a*) can hardly be other than beneficial, the saving in question being by hypothesis confined to a particular class of society. This seems to be the principal lesson to be derived from Mill's discussion of the question (*Pol. Econ.*, bk. i. ch. v. §§ 5 and 8). The second tendency (*b*) the offer of better terms to the working class may have various results. (1) It may lead merely to the increase of population; which all would not regard as beneficial. (2) It may lead merely to an increase of idleness. "At one time," says the hero of Miss Edgeworth's *Ennui*, "I had a mind to raise the wages of labour, but Mr. Macleod said, it might be doubted whether the people would not work less when they could with less work have money enough to support them." (3) Increased wages may be expended on luxuries which may possibly be less liberal than the luxuries foregone by the wealthy. (4) The result may be to increase efficiency and to further increase wages; the expenditure of the capitalist class being restricted to necessaries. Altogether, considering the diversity and remoteness of these deductions, it may be doubted whether economic reasoning much strengthens the motives to saving which ordinary prudence supplies to the wealthy classes. Lastly, Dives might give away part of what he now spends on himself. It is difficult to believe that rational benevolence cannot discover a better way of employing money than to spend half a guinea on a dish of green peas (Hill's *Boswell*, p. 56 and cp. note). When Dr. Johnson asked, "Has it not gone to the *industrious* poor, whom it is better to support than the *idle* poor," he forgot that the industrious poor would be equally employed in making things to be given away as in making objects of luxury. As Hume says (*Essays*, pt. ii. 2), "that labour which at present is employed only in producing a slender gratification to one man would relieve the necessitous and bestow satisfaction on hundreds." On the other hand, charity often defeats its own end; and the disinterested resignation of luxuries must be preached with caution. To resign all luxury is a rule of conduct which cannot justly be prescribed for one class only, and which becomes absurd when applied universally. This absurdity is happily illustrated by Miss M. Benson, *Capital, Labour, and Trade*, ch. iii. "The end of it would seem to be an immense population working all their days, living on the bare necessaries of life,"—like ants.

The old and noxious fallacy that the extravagance of the rich is necessary for the employment of the poor is now nearly extirpated. But there is some appearance in contemporary socialist literature of an opposite misconception. It seems to be held that production on a large scale is not possible unless the masses are large consumers, beyond what is necessary for efficiency—for otherwise the proposition is a truism. The most intelligible argument in favour of this thesis is that the unsteadiness of the demand which a wealthy class has for whimsical luxuries is apt to discourage production.

The attempt to restrain luxury by SUMPTUARY LAWS, or to utilise it by TAXATION will be treated elsewhere.

LUZAC, Elie (1723-1796), born at Noordwyk, studied law at Leyden, became a bookseller and publisher, and, after having graduated in 1759, also a lawyer; he wrote many juridico-philosophical works, and translated Montesquieu's *Esprit des Loix.*

His economical work is entitled *Holland's Rijkdom* (Holland's wealth), and is a translation of a French work, *Commerce de la Hollande, par Accarias de Sérionne* (Londres, 1778), but greatly amended and completed. A German translation of the French edition by Beuzler appeared 1778, two of the Dutch editions by Engelbrecht (Greifswold, 1788), and by Luder (Leipzig).

The work contains an historical exposition of the growth and decline of the Dutch trade from the middle ages to the author's time, followed by an inquiry into the causes of its decline and the means of restoration. Under the first—excluding moral and political causes—he mentions the levying of high taxes on necessary victuals as causing high wages, and in consequence high prices, and the importation of East Indian articles which could be obtained at home. As efficient means of redress he considers the establishment of a limited free port; taxes principally on articles of luxury; the granting of privileges of various kinds to manufacturers and their workmen with a view to lowering prices, etc. The historical part of the book is by far the most interesting.

A. F. V. L.

MABLY, Gabriel Bonnot, Abbé de (1709-1785), elder brother of Condillac, born at Grenoble, died at Paris, was a communist in theory, but he neither aimed at being the leader of a school nor expected to put his ideas into practice. In character he was upright, never trifling with his duty. At first it seemed that he was destined to take orders,—he was educated by the Jesuits at Lyons and afterwards at their seminary of St. Sulpice in Paris. But early in life he entered on a secular career and became the secretary of his uncle, Cardinal de Tencin, then minister of state. The Cardinal seems to have been singularly incapable, for it was the duty of Mably to draw up even his simplest notes. In this position Mably was so highly thought of that he was charged with important diplomatic missions; thus in 1743 he was sent to Prussia to conclude a secret treaty against Austria; and in 1746 he drew up the instructions for the plenipotentiaries who were engaged at the Congress of Breda. But he soon came to a disagreement with Cardinal de Tencin, and in a cause which was entirely to his honour. The Cardinal wished to disannul a protestant marriage. Mably opposed this energetically. "I wish to act as a cardinal," his uncle said to him; "act as a statesman," replied Mably, who left him and a settled career for authorship.

In his first work, *Parallèle des Romains et des Français par rapport au gouvernement*, 1740, 2 vols. 12mo, Mably by no means appeared as the communist leveller he afterwards became. In it he extolled absolute monarchy, regarding men as incapable of governing themselves; and he was warm in praise of luxury. This phase of thought did not last long. In 1748 he produced the 1st ed. of *Le Droit public de l'Europe fondé sur les Traités*, 2 vols. 12mo (the 3rd edition in 1764 was continued to the treaty of Paris, 1763, in 3 vols.), in this, after having approved negro slavery in the colonies, he began to show the extent of existing social inequalities. In 1763, he published *Les Entretiens de Phocion sur le rapport de la morale avec la Politique traduits du Grec de Nicoclès*, 12mo. This travesty, as it may almost be called—the best of his writings in style, and a happy example of rhetorical exaggeration—eulogises the institutions of Lycurgus, and marks the author as a member of the school of J. J. Rousseau. It is a step towards those socialistic ideas which caused Mably to be placed among the forerunners of communism, though of itself it would not have been a sufficient basis for the reputation which later years have awarded him. In 1768, Mably addressed to the economists, in the person of Mercier de la Rivière, his *Doutes proposés aux philosophes économistes sur l'ordre naturel et essentiel des sociétés politiques*, 12mo. This publication embodied an attack on landed property. "It is property which introduced indolence and sloth into the world . . . I see, from the moment that property in land was established, inequality in fortunes begin; are not clashing and conflicting interests the necessary result of inequality in fortune,—all the vices of riches, the vices of poverty, the impoverishment of mind, the corruption of habits, etc. . . . ? Property has peopled the earth only with brigands and thieves. The greater the effort we make to return to equality, the nearer we shall be to happiness." Personal property alone found favour with

him. In 1776, in his work, "*De la législation ou principes des Loix*, 2 vols. 12mo, and in the work *Des Droits et des Devoirs des Citoyens*, which only appeared after his death, he supported the system of community in goods. He feared, however, that property would not allow itself to be abolished as easily as he wished. Plato had said 2000 years before, "This would be too much to ask of men born and brought up as they are now." Like Plato, Mably exclaimed, "The evil at the present time is too inveterate to allow us to hope for a cure." And he admits as transitory methods of improvement—better land laws, limitation of fortunes, a Spartan education, sumptuary laws, the abolition of the right of bequest, the interdiction of trade, and the abasement of arts and industries. He proscribed neither family life nor religion; he even wished for an established religion and selected the Catholic religion. He maintained it was necessary that the state should be intolerant. Instead of a centralised state he wished for a federation; and to promote this, he published in 1784 his *Observations sur le gouvernement et les lois des États-unis d'Amérique*, 12mo, in which he prophesied the fall of that country, if it continued to give to commerce and industry the pre-eminence which has since been the basis of its prosperity. As has been seen, Mably took, though in error, a step beyond J. J. Rousseau. The latter preached equality and a return to what he called the state of nature. Mably demanded, as the means for realising this ideal, a community of goods without inquiring, as Cabet did later, into the details of the means of bringing it about. And yet in the following passage of his book, *Le Droit public de l'Europe fondé sur les traités*, vol. ii. pp. 417-418, 3rd edition, 1764, Mably had given proof of a power of intuition which ought to have saved him from the mistakes just described. "What would cause a singular revolution in Europe would be if America shook off the yoke of Spain in order to govern itself by its own laws. No doubt the rebels, with a view to interesting Europeans in their fate and preventing them from supplying help to their opponents at the court of Madrid, would be willing to open to them all their ports and to lavish their wealth on them, but this event would only give a transitory prosperity to our avarice. The Americans will soon possess our arts and manufactures, their land will soon bear our fruits; and in consequence, as they will have no longer any need of our merchandise or our produce, Europe will gradually fall into the same state of indigence she was in four centuries ago."

The complete works of Mably were published after his death in 1789, 12 vols. 8vo; in 1793, 26 vols. 12mo; in 1794, 15 vols. 8vo; finally in 1797, 12 vols. 8vo. His posthumous works appeared in two editions, 1790-91, 4 vols. 12mo; 1797, 3 vols. 8vo. A. C. f.

[See Sudre, *Histoire du Communisme.*]

MACADAM, JOHN LOUDON (1756-1836), invented the "macadamised" system of road-making, which effected "the greatest improvement in the means of inland communication subsequent to the introduction of canals and before the great extension of railways" (Waller's *Imperial Dictionary of Universal Biography*, art. Macadam). It was while acting as road trustee in his native county of Ayrshire that Macadam's attention was drawn to the condition of highways. In 1811 he laid the result of his investigations before parliament. In 1815, as surveyor-general of the Bristol roads, he so successfully applied his methods that in 1823 parliament granted him £10,000 in return for his expenses in the public service.

Macadam published *A Practical Essay on the Scientific Repair and Preservation of Public Roads*, London, 1819.—*Remarks on the Present System of Road-making*, 5th edit., 1822; 9th edit., 1827 (Longmans).—*Observations on the Management of Trusts for the Care of Turnpike Roads*, London, 1825. A. L.

The use of stones of uniform size broken into angular pieces, which have a tendency to lock together into a hard and compact mass, was the prominent feature of the system carried out by Macadam—"Such a size as you can comfortably put into your mouth," was his rule with his workmen (see also Life, *Dict. Nat. Biog.*). The economic advantages of improved methods of communication are almost incalculable (see CANALS; COMMUNICATION, MEANS OF; TRANSPORT, COST OF INLAND).

MACANAZ, MELCHIOR DE (born about the end of the 17th century), became *Intendente general* of Aragon, and on behalf of King Philip V. carried on negotiations in Paris with the papal nuncio for the repression of the abuses existing in the Spanish church. He defended the prerogatives of the crown with such acrimony that he roused the permanent hatred of the Spanish clerical party, and was obliged to cross the French frontier. On his return to Spain some years later he was apprehended and confined in the castle of Segovia, where he remained till the accession of Charles III. He did not survive his liberation many years.

The most noteworthy economic writings of Macanaz are the *Auxilios para bien gobernar una Monarquía Catolica* (Helps for the Right Government of a Catholic Monarchy), published separately after his death in 1789, and also included in the *Semanario Erudito* of Valladares (Madrid, 1788, vol. v.); the *Avisos Políticos, Máximas prudentes y Remedios universales*, presented to King Ferdinand VI., and his *Representacion expresando los notorios males que causa la despoblacion de España* (Representation on the Notorious Evils Caused by the Depopulation of Spain). Many of his writings have not been printed.

Macanaz is a warm follower of COLBERT (see *Auxilios*, pp. 233-236, 243, 287-289, vol. v. of *Semanario Erudito*). He also lays down some of the principles on which the assessment of taxes should be based. Adam Smith later insisted on similar rules: taxes "must be . . . adjusted to the means of the subjects (p. 290) . . . the raising them must not weigh heavily on the tax payers" (p. 292). At the same time, he rejects all taxes whatever on food (bread, meat, wine, and salt), and recommends the establishment of an official and exact return of the means of each individual subject, on which a tax of 10 per cent, including all kind of taxes on eatables, might be assessed (pp. 290-291). E. Ca.

M'CULLOCH, JOHN RAMSAY (1789-1864), statistician and economist, born at Whithorn in Wigtownshire, studied in Edinburgh, and entered the office of a Writer to the Signet there.

He soon abandoned the law, and devoted himself to the study of economics. His first publication (1816) was *An Essay on a Reduction of the Interest of the National Debt*, in which he sought to prove that such reduction was the only possible means of relieving the distresses of the commercial and agricultural interests; while it was also a just measure, and one founded on the surest principles of political economy. For ten years (1817-1827), M'Culloch contributed the economic articles to the *Scotsman*, and for two years (1818-1819) he was editor of that journal. In 1818 he wrote an article in the *Edinburgh Review* on Ricardo's *Principles of Political Economy*, and for nearly twenty years after that he contributed almost all the economic articles to the *Review*.[1] Proceeding to London in 1820, he formed classes for the study of political economy, and in 1824 delivered the Ricardo lectures. The materials in these lectures were afterwards expanded into an article on political economy for the supplement to the *Encyclopædia Britannica*, and they were also substantially utilised in a separate publication entitled *A Discourse on the Rise, Progress, peculiar Objects, and Importance of Political Economy*, 1824-1825. Subsequently M'Culloch published a still more extended and formal treatise on *The Principles of Political Economy; with a Sketch of the Rise and Progress of the Science*, 1825. Between 1830 and 1886 six other editions of this work appeared in London and Edinburgh.

M'Culloch was examined before the parliamentary committee on the state of Ireland in 1825, when "he argued that absenteeism could not materially injure that country, because rent was ordinarily remitted through the medium of bills of exchange drawn against exports." This theory was trenchantly attacked in *Blackwood's Magazine* (vols. xix. and xxiv.). In 1828 he was appointed to the new but unendowed chair of political economy in University College, London, which he resigned in 1832. M'Culloch published, in 1826, an *Essay on the Circumstances which determine the Rate of Wages and the Condition of the Labouring Classes*. This was perhaps his most distinctively original work, but the famous "wages fund theory" which he propounded, and which was very largely accepted for at least a generation, was ultimately abandoned by the best economic authorities. *A Treatise on the Principles, Practice, and History of Commerce*, which M'Culloch contributed to the *Library of Useful Knowledge*, 1831, was remarkable as an early exposition and defence of the principles of free trade. It was followed in 1832 by M'Culloch's important statistical work, *A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation*. This comprehensive publication embodied the researches of twenty years. It was succeeded in 1837 by *A Statistical Account of the British Empire*, undertaken by M'Culloch, with the aid of a body of specialists, for the Society for the Diffusion of Useful Knowledge.

In 1838 M'Culloch was appointed comptroller of Her Majesty's stationery office, a post which he held until his death. He did not relax his economic studies after his appointment to the comptrollership, but published in 1841 his *Geographical, Statistical, and Historical Dictionary*, which contained brief descriptions of the various countries, places, and principal natural objects in the world. In 1845 appeared his *Treatise on the Principles and Practical Influence of Taxation and the Funding System;* and during the same year he published his *Literature of Political Economy*, "a classified catalogue of select publications in the different departments of that science, together with historical, critical, and bibliographical notices," a work of great use to the economic student. The results of M'Culloch's inquiries into the influence of primogeniture, entails, compulsory partition, etc. over the public interests, appeared in his *Treatise on the Succession to Property vacant by Death*, issued in 1848; and a work of his on *Economical Policy*, containing treatises and essays on various subjects, and memoirs of Quesnay, Adam Smith, and Ricardo—was published five years later. He edited in 1856 for the Political Economy Club,—of which he was one of the original members—a *Select Collection of Valuable Tracts on Money*, by Vaughan, Cotton, Petty, Lowndes, Newton, and others. In 1856 he edited *Early English Tracts on Commerce*, by Mun, Roberts, North, and others: for Lord Overstone, in 1857, *Tracts on the National Debt and the Sinking Fund*, by Harley, Gould, Pulteney, Walpole, Hume, Price, and others:—in 1857, *Tracts on Paper Currency and Banking*, by Hume, Wallace, Thornton, Ricardo, Blake, Huskisson, and others;—in 1859 pamphlets on *Commerce*, by Evelyn, Defoe, Richardson, Tucker, Temple, and others;—in 1859, *Economical Tracts*, by Defoe, Elking, Franklin, Turgot, Anderson, Schomberg, Townsend, Burke, Bell, and others. He also collected Lord Overstone's *Tracts and other Publications on Metallic and Paper Currency*, 1857, and his *Evidence before the Select Committee of the House of Commons of 1857 on Bank Acts*. In 1860 he contributed to the *Encyclopædia Britannica* (8th edition) the article on *Taxation*, which was separately reprinted the same year.

In addition to the works specified above M'Culloch wrote a great number of minor pamphlets, tracts, and articles on subjects connected with political economy. He edited A. SMITH'S *Wealth of Nations* with copious notes, etc. (1828, 2nd ed. 1838, 3rd ed. 1863), and also the works of RICARDO, with a life of the author (1846, 2nd ed. 1852). M'Culloch was no original thinker, but a close student and follower of Smith and Ricardo, whose principles he expounded, and he assisted in the dissemination of the ideas on economic questions which prevailed at the beginning of the 19th century, and furthered useful legislation with regard to them. His treatment of these questions was little marked by breadth or elevation; this and his habit of dogmatism tended to alienate many from the science of which he was, at the time, one of the prominent exponents. Until the

[1] For a list of these, see *Notes and Queries*, 5th October 1878.

rise of Mill, his *Principles* had a considerable vogue among English and European students of political economy. His description of his own Library, *A Catalogue of Books the property of a Political Economist* (privately printed, London, 1st ed. 1856, 2nd with adds. 1862), and the critical notices of the books it contains, are evidence of the extent of his studies.

[*Annual Register*, 1864; "Men of the Reign," *Scotsman*, Nov. 12, 13, 1864.—*Dictionary of National Biography*, vol. xxxv.—Bain's *Life of James Mill.*—*Chambers's Encyclopædia*, vol. vi.; Quaritch, *Dictionary of English Book-Collectors*, pt. vi., Feb. 1895, gives, along with life, portrait and facsimile of letters.] G. MACE. A denomination of the Chinese money of account, but not a coin. 100 cash = 1 mace (*see* CASH). F. E. A.

M'FARLAN, JOHN (fl. end of 18th century), clergyman and philanthropist, was one of the ministers of the Canongate, Edinburgh. When he published *An Inquiry concerning the Poor*, Edinburgh, 1782, 8vo, he had been for fifteen years connected with almost every charitable foundation in Edinburgh. The *Inquiry* treats of the causes of poverty, and the different methods employed to provide for the poor, and then proceeds to suggest reforms, of which the more important are, an improved police, efficient voluntary managers, and paid inspectors, and the building of houses of correction in every parish. The book is dedicated to Lord Kames, to whose suggestions it owed much. H. E. E.

MACGREGOR, JOHN (1797-1857), was a native of Scotland, eldest son of David Macgregor of Stornoway. He emigrated to Canada early in the century, became a member of the house of assembly of Prince Edward's Island, and later travelled through North America, returning to England in 1828. He was a friend of J. Deacon HUME of the board of trade, and with him projected a vast work on the statistics of the British empire, which was never undertaken: he occupied his time, however, with other works on history and statistics. In 1840 he succeeded Hume as joint secretary at the board of trade, but resigned in 1847. Macgregor expressed his views with vigour alike in his writings and in evidence before several committees of the houses of parliament. His views were favourable to free trade, and his evidence before the committee of 1840 was considered a severe blow to protection. The general tendency of his opinions was strongly utilitarian.

Of his more purely economic or statistical works, the chief were:—*The Resources and Statistics of Nations*, London, 1835, 8vo.—*Commercial and Financial Legislation of Europe and America*, London, 1841, 8vo.—*The Preference Interests or the miscalled Protective Duties shown to be Public Oppression*, 1841.—*Financial Reform*, 1849.

[See *Dictionary of National Biography.*] C. A. H.

MACHAULT D'ARNOUVILLE, JEAN BAPTISTE (1701-1794), one of those few ministers of Louis XV. who were both honourable and able. He never aimed at becoming a financier, and was master of appeals when D'Argenson, who had divined his ability, procured his appointment as commissary of the treasury at Valenciennes, from which he was subsequently promoted, without his knowledge, to the office of controller-general in place of Philibert Orry, a functionary who was a faithful slave to the ideas of Cardinal Fleury. Machault was raised to power at a difficult time. For four years Europe had been in confusion through the war of the Austrian succession. France was the preponderating force in the struggle, and though she obtained military success, her financial affairs felt the disastrous effects. Cardinal Fleury was dead, and with him the system of economy which, though blamed by some, had at least the advantage of easing the shoulders of the taxpayers. The era of senseless prodigality and the costly reign of recognised mistresses began. Madame de Pompadour was the first of these. Machault had to meet this order of things, and to deal with the most urgent claims. The commencement of his ministry (1745-48) was entirely given up to shifts of all kinds which there is no need to detail. The Treaty of Aix-la-Chapelle (1748) gave peace to Europe, and made the state of affairs more bearable. Machault profited by this to establish reforms in taxes and in the management of the national debt. Instead of the tax of the tenth, a war tax not paid by all classes, he established the tax of the twentieth (VINGTIÈME *q.v.*), a permanent and general contribution. The nobility and clergy were called on to pay it like the rest of the population. The produce of the twentieth was employed to maintain a sinking-fund, intended to lighten the weight of the national debt. Machault then introduced liberal measures which reanimated business, and showed for a moment a glimpse of prosperity and abundance. His reforms excited unanimous opposition among the privileged classes. The clergy bestirred themselves to such effect that they were exempted from paying the tax on condition of making a donation. The *Pays d'états* (see INTERNAL CUSTOMS AND TOLLS) obtained the same exemption by a trifling contribution. These checks and others of the same class determined Machault to resign the controllership (1754), and he passed to the admiralty, to which his great administrative ability enabled him to render valuable services. A court intrigue was the cause of his definitely giving up the admiralty and at the same time the keepership of the seals which he had held since 1750. In 1757 he returned to private life, which he only left to die in prison. The reforms he had instituted did not last, and the foundations he had laid were broken up as soon as he retired from office.

[M. Marion, *Machault d'Arnouville: étude sur l'histoire du contrôle général des finances de 1749 à 1754*, Paris, 1891, 8vo.] A. C. f.

MACINATO, or grist tax, in Italy. The idea of taxing the grinding of cereals is of old date in Italy. In Sicily a tax of this description existed in the middle ages; probably the Arabs introduced it. Such a tax certainly existed as a right of the crown under the Normans (1168).

The tax was in force at Florence in 1288,—at Milan in 1333; and it was rearranged, suppressed, and reimposed several times. Towards 1650 the grist tax became general nearly all over Italy—imposed with minute care in Florence, Sicily, Piedmont, and the Venetian republic. In Tuscany a law of Cosimo I. (7th Oct. 1552) graduated the grist tax from $3\frac{4}{10}$ *soldi* down to $1\frac{4}{10}$ *soldi* for every *staio* (a measure of the period), according to the various species of cereals, and comprised every grain, from corn to maize, barley, beans, etc.

This tax was levied throughout Tuscany, but with a higher tariff in Florence.

Introduced only for three years, to raise the funds for war, it gave such satisfactory results that it was continued 126 years without interruption, and gradually brought to perfection in technical details. In 1675 the government farmed the tax out till the 1st of June 1678, when it was suppressed and a personal tax substituted for it. Only in some districts the taxation of flour was continued in an OCTROI at the town-gates, till, with the progress of free-trade principles, this duty also disappeared in Tuscany.

In Sicily the grist tax was universal when parliament regulated it in 1565. This charged the collection of the tax on the local governments—the central government dividing it amongst the towns and rural districts, and avoiding direct contact with the taxpayers.

As, however, a great deal of clandestine grinding was carried on, the government made contracts with the landlords or their tenants, to commute for a fixed annual charge the liberty of grinding the corn necessary for themselves and their dependents. In this way a distinction between the civic and the rural gristing tax was introduced.

In Sicily the grist tax did not answer so well as in Tuscany. It was modified several times and temporarily suspended on several occasions as on the revolution of 1648, against the viceroy. In 1843, by a decree of the 22nd July 1842, the government took the grist tax directly into its hands, except for Palermo and Messina, and leased it out for six years. Every mill was put under the control of an official who weighed the quantity ground. The revolution of 1848 suspended the tax, but it was re-imposed, with a lower tariff, by the revolutionary government itself, and continued by the Bourbons, as soon as they returned. In 1860, Garibaldi, as Dictator, abolished the tax, 19th May 1860, and Sicily has never again been subject to it.

In Piedmont the grist tax was first introduced in 1577, as a duty due to the ducal mills of Fossano; in 1614, Carlo Emanuele I. extended it to the whole of his dominions to provide for his army, but he substituted a capitation tax for it the next year.

In 1616 the grist tax was reintroduced, unsuccessfully leased out in 1619, abolished in 1621, re-established in 1622. A hearth tax (*fuocaggio*), was substituted for it in 1635. The grist tax was re-introduced in 1691, but it was transformed into a direct tax on mills. In the next year a capitation tax was substituted, which in 1701 again gave way to the grist tax, definitively abolished in 1713 by Victor Amedeo.

In the Venetian republic, the grist tax was introduced in the beginning of the 16th century, and continued till the downfall of the republic.

In the remainder of Italy the history of the *macinato* is uniform. Everywhere it seemed indispensable: at Milan, at Parma, in Genoa, in the papal states. Only in Naples the grist tax seems to have been generally a communal tax or local government tax, and not connected with the central government. With similar traditions it was quite natural that the Italian government, when the budget deficit increased to 400 millions of lire (16 millions sterling), and made it necessary to find a tax with a broad basis and a rapid effect, should have fallen back on the grist tax.

Nevertheless the chamber of deputies did not immediately accept it, from repugnance to a tax which had been very odious in ancient times, and which could by a very small variation of the tariff be transformed into an instrument of great fiscal pressure.

Sella proposed it, 13th Dec. 1865, and parliament would not even consider his bill. His successor, Scialoja, re-introduced it, 26th January 1866, and the financial committee of the chamber rejected it.

After the war of 1866 Scialoja re-introduced, 16th January 1867, a grist tax, and again was beaten. His successor, Depretis, re-introduced the same bill as Scialoja had done, 11th June 1867. The chamber appointed a special commission of eighteen members to consider the bill, and this commission re-introduced it with modifications 21st April 1868. But the chamber rejected the proposals of its commission, inviting it to study the proposition over again, and a second report was presented 30th May 1868. On the 7th July 1868 the bill passed the chamber and became law 1st January 1869. The system adopted consisted in applying an instrument in the mills which registered the

revolutions of the millstone or those of the cylinders and taxed the miller in accordance, giving him the right to charge every customer a fixed rate, according to the weight of the cereals ground, viz. 2 lire for every hundred kilogr. of corn; 1 lira for maize and barley; 1.20 lire for oats and 0.50 for other cereals. As the instruments which ought to have been applied were at first not ready in sufficient number, much arbitrary taxation took place, and provoked riots, in repressing which blood was shed. The tax gave, immediately after the first year, extraordinary results, as the following figures prove:

Year.	Lire.
1869 . . .	17,582,410
1870 . . .	26,957,284
1871 . . .	44,585,709
1872 . . .	59,109,999
1873 . . .	64,347,323
1874 . . .	68,879,570
1875 . . .	76,642,310
1876 . . .	82,521,093
1878 . . .	83,139,767

After 1878 the tax began to be partially reduced. The tax was abolished completely in 1884. The results for the four years after 1878 were:

Year.	Lire.
1879 . . .	75,485,305
1880 . . .	56,627,279
1881 . . .	57,617,701
1882 . . .	51,607,695

In 1874, the methods for applying the tax reached their greatest perfection by the invention of a new instrument which weighed the corn which was being ground, instead of counting the revolutions of the millstone.

In 1876, however, a new political party came into power, and sought popularity by reducing the macinato provisionally and voting for its abolition in 1879. The proposal was rejected at the time, but this vote was the primary cause of the financial troubles Italy soon after experienced (see MAGLIANI). The tax was abolished completely in 1884. M. P.

MACLEAN, J. H., Scotch advocate, was the author of *Remarks on Fiar Prices and Produce Rents*, Edinburgh, 1825, 8vo. By FIARS PRICES are meant, the prices of the various kinds of grain, as determined by juries summoned by the sheriffs for the purpose. The juries, which consist of experts, meet in February and March, and, having examined witnesses and returns of sales, specify in their verdict the average prices of the different descriptions of grain in the county during the preceding year; and the sums, stipulated to be paid in lieu of grain, etc., are determined by the results of their verdicts. They appear to have been struck as early as the end of the 16th or beginning of the 17th century.

[Adam Smith, *Wealth of Nations*, bk. i., ch. xi.—M'Culloch's *Literature of Political Economy*, p. 196.] H. E. E.

M'LENNAN, JOHN F. (1827-1881) anthropologist, contributed the article on "Law," to the *Encyclopædia Britannica*, 8th ed. In 1865 he published *Primitive Marriage*, wherein the very curious and widespread custom of marriage by capture was first carefully considered. Promiscuity, with complete absence of the sense of kinship, kinship through female only, polyandry with its modifications, leading in turn to kinship through the father;—these, according to M'Lennan, represent the successive stages of social progress. In the course of his argument, he was brought into conflict with the theories of Sir Henry Maine. *The Patriarchal Theory*, edited and completed by his brother, and published in 1885, contains a more detailed criticism of Maine's position. *Studies in Ancient History*, published in 1876, contained a reprint of *Primitive Marriage*, together with other essays.

The most important of the other writings of M'Lennan were articles on Totemism in the *Fortnightly Review*, N.S., vols. vi. and vii. Although the services of M'Lennan as a pioneer have been generally recognised, his conclusions have not, as a rule, found favour with subsequent writers, *e.g.* Herbert Spencer, *Principles of Sociology*, vol. i. ch. iv.-vi.—C. N. Starcke, *The Primitive Family*, London, 1889, 8vo (International Science Series).—and E. Westermarck, *The History of Human Marriage*, ch. iv.-vi., xiv. and xxii., London, 1891, 8vo. See, however, W. Robertson Smith, *Kinship and Marriage in Early Arabia*, Cambridge, 1885, 8vo, who finds striking confirmation to the general soundness of his construction "in the field of Semitic facts." Sir H. S. Maine, *Early Law and Custom*.—A. Lang, *Custom and Myth*.

[*Dictionary of National Biography*, vol. xxxv. p. 210.] H. E. E.

MACNAB, HENRY GREY (1762-1823) M.D., social reformer, was a pupil of the philosopher Reid at Glasgow university, where he afterwards held an appointment. In 1786 he published a *Plan of Reform in the mode of Instruction practised in English Schools*, Glasgow, 4to. In *A Letter addressed to John Whitemore, Esq., M.P.*, London, 1801, 4to, on the subject of the London coal supply, he incidentally states that he had lived his whole life in a coal mining country, and had had many opportunities of investing in mining speculations, but had always avoided them on the ground that the average profits did not compensate for the capital required and the attendant risks. At the time of the rupture of the Treaty of Amiens, Macnab, being in France, was detained as a hostage. He was, however, allowed to pursue the practice of medicine and the study of social questions. At the close of the war he preferred to remain in France.

In 1818 he published *Analysis and Analogy recommended as the means of rendering Experience useful in Education*, Paris, 4to, a not very lucid treatise on a difficult subject. Macnab took

great interest in the experiments of Robert OWEN (*q.v.*), and in 1819 published *The new views of Mr. Owen impartially examined*, London, 8vo. The sympathy shown by the Duke of Kent to Owen may have been due to the influence of Macnab, who had been appointed the Duke's physician. In his last work *Observations on the Political, Moral, and Religious State of the World*, London, 1820, 4to, he seems, to some extent, to have anticipated the theories of Froebel.

[*Gentleman's Magazine*, 1823, i. p. 378.—Alger's *Englishmen in the French Revolution*, London, 1893.—*Biographie Universelle*, vol. lxxii. *supplément*, p. 654.—*Dictionary of National Biography*, vol. xxxv.] H. E. E.

MACPHERSON, DAVID (1746-1816) historian, was the son of an Edinburgh tailor and clothier. He started in life as a land surveyor. About 1790 he settled in London, and henceforth devoted himself to authorship.

Macpherson edited Andrew Wyntoun's *Orygynal Cronykil of Scotland*, 1795, 4to, 2 vols. In 1796 he published *Geographical illustrations of Scottish History*, 4to. His chief work was *Annals of Commerce, fisheries, and navigation*, London, 1805, 4to, 4 vols. The first vol. deals with the earliest accounts, up to the discovery of America, and for this Macpherson is solely responsible. In the second and part of the third volumes, dealing with the period from 1492 to 1760, he merely edits and alters the *History of Commerce* by Adam ANDERSON (*q.v.*). The last volume carries the history down to the meeting of parliament, after the union with Ireland. The book displays much labour and research, and has been generally accepted as a leading authority on the subjects dealt with, especially in the later years chronicled. In 1812 appeared a *History of European Commerce with India*, London, 4to, wherein he opposes the views of Adam Smith on the subject of the East India Company. Macpherson was for some time one of the deputy-keepers of the public records.

[*The Historians of Scotland*, edited by D. Laing, vol. ix. pp. xxxvii.-xlix.—*Dictionary of National Biography*, vol. xxxv. p. 258.] H. E. E.

MACUTA, a native African word, appears to have been originally simply a method of counting in certain parts of West Africa; a macuta being composed of ten units. Montesquieu, *De l'esprit des Lois*, livre xxii. ch. viii., describes the *macute* as "un signe des valeurs sans monnoie; c'est un signe purement idéal." Thence it became a money of account.

The Portuguese at Angola adopted it as a denomination in their local coinage, making it equal to 50 reis. The Sierra Leone Company in like manner, from 1791 to 1805, made it the basis of their monetary system, striking a dollar of 10 macutas, equal in weight, but not in fineness, to the Spanish dollar; they also struck a small silver coin to represent the macuta or 10 cents, but these appear to have had but a small circulation.

[Chalmers, *Colonial Currency*, p. 208.] C. A. H.

MADDISON, SIR RALPH (1571?-1655?) was knighted in 1603 by James I., by whom he was frequently employed in commercial affairs. In 1640 he protested against the proposed debasement of the coinage, and, during the Commonwealth, appears to have held office at the mint.

He was the author of *England's Looking in and out*, London, 1640, 8vo, reprinted in 1641. The second chapter contains a statement of the theory of the BALANCE OF TRADE (*q.v.*). The book was reissued in 1655, under the new title of *Great Britain's Remembrancer, looking in and out*, London, 8vo, with new chapters on the establishment of a bank, a council for the affairs of the mint, and free ports.

[*Dictionary of National Biography*, vol. xxxv. p. 297.] H. E. E.

MADISON, JAMES (1751-1836), the eldest son of a Virginian planter, entered public life in 1776 as a delegate to the Virginia convention, which framed the state constitution. He was a member of the first assembly, and in 1780 was elected delegate to the Continental Congress. In 1787 Madison again became a member of congress, and took a leading part in the Philadelphia Convention of that year, which framed the present American Constitution. He was elected to the new congress in 1789, and continued a member until 1797. From 1801 to 1809, during the two terms of Jefferson's presidency, Madison was secretary of state, and from 1809 to 1817 president. His claim to be the "father of the constitution" is based on the grounds, that the Annapolis Convention of 1786, from which the Philadelphia Convention took its rise, was proposed by him; that the "Virginia plan," out of which the constitution was evolved, was mainly his; and, lastly, that it was owing to him that the Virginia Convention adopted the new constitution. His subsequent public career opens out more controversial matter. By a curious irony of fate, the denouncer of "faction" (see *Federalist*, No. x.) became himself, with more or less reason, counted among the factious.

It is as one of the authors of the *Federalist* that Madison will be best remembered. These papers, written in support of the new constitution in 1787 and 1788, have taken rank among classics. That they should have issued through the medium of newspapers speaks very highly for the intelligence of the public thus addressed. Of the eighty-five papers, fourteen were undoubtedly by Madison, and three others were almost certainly the joint work of him and Hamilton. On the question of the authorship of Nos. xlix., lviii., lxii. and lxiii. there has been much controversy. In forming a judgment, internal evidence does not help, as the style is throughout uniform, grave, sonorous, based it would seem on Addison in his more serious mood. The Nos. xxxvii.-xlviii. contain a masterly general view of the powers conferred by the new constitution.

[*The Federalist*, edited by Henry Cabot Lodge, London, 1888, 8vo, the editions are numerous,

but the above is an excellent one, in one volume. —W. C. Rives, *Life and Times of James Madison*, Boston, 1859, 8vo. — Sydney H. Gay, *James Madison* (in American Statesmen Series), Boston, 1889, 8vo.] H. E. E.

MADOX, Thomas (1666-1727) studied law and was admitted to the Middle Temple. He was a clerk in the lord treasurer's remembrancer's office, and afterwards in the augmentation office. In 1714 he was appointed historiographer royal. He died without issue at Arlesey in Bedfordshire. In 1702 his *Formulare Anglicanum, or a Collection of Ancient Charters* was published. His most important work, *The History and Antiquities of the Exchequer of the Kings of England to the end of the Reign of Edward the Second*, appeared in 1711 (2nd edition, 1769). He says that it is not only a history of the exchequer, "but likewise an apparatus towards a history of the ancient law of England." This was followed by his *Firma Burgi, or an Historical Essay concerning the Cities, Towns, and Buroughs of England*, 1726; and *Baronia Anglica*, 1736 (reissued in 1741). He also intended to write a feudal history of England. The materials collected by him for the works which he prepared for publication, and for others which he projected, are now in the British Museum, comprising ninety-four volumes of notes and transcripts. Madox had a high conception of his duty as an historian. He says that "writing of history is in some sort a religious act, and ought to be undertaken with purity and rectitude of mind." He is generally cautious in his statements, and always tries to confirm them "by proper vouchers." His vouchers are copious extracts from the pipe rolls, the memoranda of the exchequer, and from other ancient records. "The public records," he says, "are the foundation (*sic*) which sustain the whole fabrick of this history [of the exchequer], a foundation solid and unshaken." This foundation was laid so broad and strong in both the *History of the Exchequer* and the *Firma Burgi* that they will long continue to be of great value to students of economic, legal, and constitutional history.

C. Gr.

MAFFEI, Scipione (1675-1755). Was born in Verona and studied literature. He fought in the Bavarian army at the battle of Donawerth. In 1710, he, with the assistance of others, started the *Giornale dei letterati*. He travelled a great deal in Europe.

In his work, *Dell' impiego del danaro* (3 vols., Verona, 1774), he deals in a striking manner, though without much novelty in argument, with the question of interest, and endeavours to reconcile the church doctrine hostile to usury with the varying requirements of commerce, maintaining that to receive compensation for the loan of money is opposed neither to morality nor to the Gospel. This book of Maffei's aroused against its author much angry feeling and recrimination. It provoked the censure of Ballerini and Concina, and drew from Benedict XIV. the encyclical letter "Vix pervenit" (1745). Ultimately it caused the author's banishment by the Venetian government.

[G. Maffei, *Storia della letteratura italiana*, Milan, 1834.—Giuliari, *Bibliografia Maffeiana*, in the *Propugnatore*, vol. xviii., Bologna, 1885.—Cossa, *Introduction to the Study of Political Economy*, London, 1893.] U. R.

MAGENS or Magen, called by Adam Smith Meggens, by Steuart, Megens, and in *Dictionnaire de l'économie politique*, Paris, 1853, Magends, Nicholas (d. 1764), a German merchant, was for many years resident in England, and gained a great reputation in commercial matters.

He was the author of the *Universal Merchant*, London, 1753, and its *Postscript*, 1756, which were translated by W. Horsley (*q.v.*). The titles of later German editions are given in C. J. Kayser's *Index Locupletissimus librorum*, Leipzig, 1834, etc., 4to, 4th part, as *Der allgem. Kaufmann Worinnen das Theoretische u. Praktische der Handlung enthalten ist*, Berlin, 1762, 4to, and *Beitrag zu allgem. Kaufmann od. Traktat von d. Handlung u. d. Vortheilen die aus d. Reduction des Geld-Interesse entspringen, nebst einen Traktat wider den Wucher: aus d. Engl. ubers u., als ein 2 theil des allgem. Kaufmann zu gebrauchen*, Potsdam, 1763-64. The author, after a general treatise on trade and on wealth, by which is meant not merely gold and silver, the common medium of trade, but a pre-eminence of industry, manufactures, and commerce, enters into an enquiry concerning bullion, after which he considers the nature, operation, and effects of banks in general and in particular. The treatise concludes with "a further illustration of the business of exchange from the tables of Sir Isaac Newton, with remarks and additions."

In the British Museum Catalogue the only works under the name of Magens are *Versuch über Assecuranzen, Havereyen und Bodmereyen insgemein*, etc., Hamburg, 1753, 4to, and a translation, *Essay on Insurances, to which are annexed some brief hints to Merchants and Insurers concerning risks to which navigation is exposed in time of War*, etc., London, 1755, 4to. The author gives as his reason for publishing, the want of any treatise in English on maritime and mercantile insurance. The translation is so much increased and amended as to make a new work. It is chiefly devoted to foreign views. "Those persons advance too much who insist that all insurances made in Great Britain on the shipping and products of foreign countries are beneficial to this nation" (Pref., p. 5). After introductory remarks on insurance, general averages, etc., the rest of the first volume is devoted to leading cases. The second volume is taken up with a collection of ordinances and laws of various dates.

[*An Inquiry into the Principles of Political Economy*, vol. 2, pp. 158-9 by Sir James Steuart, London, 1767, 4to.—*Quarterly Journal of Economics*, vol. 5, p. 356.—*Gentlemen's Magazine*, vol. xxxiv.] H. E. E.

MAGLIANI, AGOSTINO (1825-1891). An Italian economist and financier; born in Saurino, in the Neapolitan provinces. He studied law. Originally an official under the Neapolitan government, which he defended in a pamphlet published in 1857, he entered, after 1860, the service of the kingdom of Italy. In a short time he was appointed senator, and then a councillor of the court of cassation. He was minister of finance of the kingdom of Italy three times, and on the last occasion he held this post for ten consecutive years, 1879-1889.

Magliani wrote with ability, and in a bright and elegant style, on economical and financial matters, and was also an impressive parliamentary orator, well acquainted with the theory of finance, and a most able financier in practice. His most important measures were the abolition of the forced currency (1883), and of the duties on the grinding of cereals (1884) (see MACINATO), and the law effecting the organisation and readjustment of the land-tax (1886).

He was a powerful financier, of great breadth of view, confident in the future of his country. The time has perhaps not yet come for judging the full effects of his work; but this has left deep traces on Italian finance and the economic condition of the country.

Magliani won much praise, but he incurred also, more especially in his latter years, bitter reproaches for the weakness by which he first countenanced lavish expenditure and then wasted the resources of his financial capacity in devising temporary remedies, and the system of finance under which Italy still trembles on the verge of disaster.

Amongst Magliani's economical and financial works may be noted:

La quistione monetaria, 1874. Numerous articles in the *Nuova Antologia*, Rome, amongst them; *Sistemazione delle imposte dirette.—L'azione economica dello stato.—La Finanza e la liberta politica.—Le imposte locali ed i comuni.*

Amongst his numerous financial speeches published in the Italian parliamentary records, we cite as the most important:

Abolizione graduale della tassa sulla macinazione del grano (The Gradual Abolition of Duty on the Grinding of Grain) (in the senate, 1880).—*Sul provvedimenti finanziarii* (On Financial Provisions) (in the chamber of deputies, 1882), and the financial statements made in the chamber in 1882, 1888, etc. U. R.

MAITLAND, JAMES. See LAUDERDALE, EIGHTH EARL OF.

MAIZIÈRES, PHILIPPE DE, also MEZIÈRES (1312-1405), a French knight who was sometime chancellor of Lusignan, the French king of Cyprus, and made war against the Saracens. About 1370 he entered the service of king Charles V. of France, and was some years in charge of the education of the dauphin, the future Charles VI.

Maizières retired in 1379 to a convent in Paris, where he wrote his *Songe adressant au Blanc Faucon à Bec et Pieds Dorés*, 1389, the White Falcon being in fact the king of France in person. The author in the capacity of a pilgrim (the book is sometimes called the *Songe du Pèlerin*), leads *Vérité* through the countries he had himself visited in his travels, and points out the abuses and disorders he has noticed and the remedies which he suggests. One of the grievances is usury as practised by the Jews, and the remedial scheme of Maizières may be shortly summarised as follows: The king ought to constitute an initial fund derived from the proceeds of aids (taxes) and domains, and entrusted to the management of honest and pious men, who were to lend these monies to the poor people of each diocese or manor, *châtellenie*, on good security or pledge, "namely, which is to be worth more than the money they have received." At the end of the year, the debtors would "repurchase," without usury, the objects given in pawn, but in token of gratitude they would offer "freely" a tithe or one-tenth, to be converted to the increase of the sum originally given by the king. Still Maizières appears to have been suspicious about the punctual payment of these free offerings, for he elsewhere advises the States General, "in order to lay down all scruples, to determine, by mutual agreement with the Church, the amount of the alms to be offered to God, this agreement to be published as a law or good custom approved by the *Cour Royale.*" In Maizières' plan we meet all the features of the charitable *Montes Pietatis* (see MONTS DE PIÉTÉ), which were first founded in Italy about eighty years later, and were then under the influence of the Franciscans imitated from the Italian state *montes*, whose object had been purely financial.

[Professor Victor Brants, *Philippe de Maizières et son projet de Banque Populaire* (a short tract of 16 pages, Louvain, 1880), and the same writer's *Théories Économiques aux XIII^e^ et XIV^e^ Siècles* (pp. 159-162), Louvain, 1895.]

E. CA.

MAJESTAS. The *crimen majestatis*, or *læsæ majestatis*, is the *crimen* of treason, *i.e.* the charge or the crime of injuring, or attempting to injure, in various ways, the sovereign power and greatness (*majestas*) of the Roman people, or of its representative, the emperor. (See Smith's *Dict. of Antiquities*, *s.v.*). E. A. W.

MAJOR, JOHN (?1469-?1549), was one of the most distinguished of the later schoolmen, and a leader of the nominalist party. A Scot by birth, he became famous as a professor of theology at Paris, and then spent the last eighteen years of his life as provost of the college of St. Salvator at St. Andrews. In his *Commentaries on the Sentences*, published about 1516, he touched current economic discussion in several points. His opinion that a community might properly restrain the liberty of public begging was of great assistance to those in Catholic countries who sought to introduce reforms in the relief of the poor. On the other hand, his opinion that the "triple contract," *contractus trinus*, defended by ECK (*q.v.*), was not usurious, was overborne for the time by the Catholic counter-reformation.

[CANON LAW. See for estimates of Major's position as a theologian, T. G. Law in *The Scottish Review*, April 1892; and the *Life* prefixed to Major's *History of Greater Britain* (Scottish Hist. Soc., 1892), by H. T. W. Mackay. For his economic opinions, see Ashley, *Econ. Hist.*, i. pt. ii. pp. 340-341, 443-446.] W. J. A.

MAJORAT, the French and German term (in Spanish *Mayorazgo*) for an entailed real estate annexed to a title of nobility and descending by right of PRIMOGENITURE (*major natu*). Abolished in France at the time of the French Revolution, majorats were re-established in 1806 by Napoleon under two forms: the *majorat de propre mouvement* founded by the head of the state with a grant of real estate or a pension for distinguished services, and the *majorat sur demande*, by which heads of families were legally authorised to settle thus their previously acquired real property. The pensions hitherto paid by the state have been redeemed this year (1905). After 1830, when the peerage ceased to be hereditary, the creation of new *majorats* was prohibited, and the existing *majorats sur demande* were restricted to two *degrees* or lives. Since 1848 the whole subject is controlled by articles 896 and 1048 of the *Code Civil*; these enact that *substitutions*, —entails of property,—either real or personal, are only valid for one life, and in favour of grandchildren, or of children of the brothers and sisters if the Donor dies without children; this concession only applies to such portion of his property as the testator, if he has children, is allowed to bequeath (see BEQUEST, POWER OF). In Germany, the foundation of *majorates* is still allowed by law and such entailed property is included under the general judicial name of *Familienfideicommisse*. Personal as well as real property may be settled thus, but generally only when the value exceeds a minimum which varies in each particular state. In Prussia a settlement of personal property cannot be less than a money capital of 30,000 marks (say £1500), and a real estate thus disposed of must at least yield a net income of 7500 marks or £375. In other respects, the conditions required also vary between one state and another; for instance in Prussia the real estates must be rural estates, *Landgüter*, houses being excluded. The general principle is that the settled estate must be important enough to uphold the prosperity of the family, which consequently is endowed by law with a permanent right of control.

In the eastern provinces of Prussia 1975 estates covering 1,408,860 hectares (3,522,150 acres), of land, or 6·20 per cent of the whole territorial area are thus owned mostly by princely and noble families. This proportion of the total territory is larger than it is in Cis-Leithan Austria, where it only reaches 4·1 per cent, covering 880 estates. This description of limited ownership is, in fact, only met with in the districts where feudal influences and traditions have maintained their former ascendency. Of the above-mentioned East Prussian estates 197, or 92 per cent, have an area larger than 1000 hectares (2500 acres). More than 300 estates have been settled thus since the end of the first half of the present century; however, it ought not to be forgotten that the larger portion of *Familienfideicommisse* (see FIDEICOMMISSUM) established during this century were formerly held by feudal tenures, which have disappeared. Of the estates larger in extent than 1000 hectares (2500 acres), 43·4 per cent are farmed, 34·2 managed by stewards and only 22·4 *administrirt*, *i.e.* personally managed, by the holder himself.

This survival of aristocratic tenure of land is not always considered as invariably advantageous, and fears have often been expressed that it may lead to an excessive concentration of landed property in the hands of a few families, and, when the owner for the time being is heavily in debt, to an inferior system of cultivation. It is also pointed out that this concentration leading to the extension of the LATIFUNDIUM (*q.v.*) is especially to be deprecated in a country where the population is rapidly increasing, and where an increasing proportion of the inhabitants may thus be cut off from the possession of land.

To conclude, the German *Anerbe* and *Hofrecht* in its modern form, to a certain extent founded on the same principle as the American HOMESTEAD AND EXEMPTION LAWS, is intended to protect small peasant ownership against the risk of division, but it is not enacted that the *Hof*, the family dwelling *with* land, shall be inherited by the eldest heir. In some districts it is transmitted by MINORAT, in others recourse is had to ballot or even to drawing by lot, whenever the owner has not exercised his right to appoint the heir expectant among his natural and legal heirs. The former has always to indemnify the latter. (Miaskowski, *Das Erbrecht und die Grundeigentumsverteilung in Deutschland*, 1882-4.)

[See *Majorat* in Holtzendorff, *Encyclopædie des Rechts* (Leipzig, 1870), and *Fideicommisse* in Conrad's *Handwörterbuch der Staatswissenschaften*.] E. Ca.

MAKER (of Promissory Note). A promissory note is a signed unconditional promise in writing to pay a certain sum to, or to the order of, a specified person, or to bearer. The person who makes the promise is called the maker of the note. Sometimes he is spoken of as the "drawer," but he must be distinguished from the drawer of a bill of exchange. The drawer of a bill is only liable if the drawee or acceptor dishonours it. The position of the maker of a note is analogous to that of the acceptor of a bill. He is the principal debtor on the instrument. He undertakes "to pay it according to its tenour," and is "precluded from denying to a holder in due course the existence of the payee and his then capacity to indorse."

[Bills of Exchange Act, 1882, §§ 88, 89.] M. D. C.

MAKING-UP (on the stock exchange). Twice every month a general settlement takes place

in the stock exchange, when accounts are made up in all stocks and shares other than those in the consols department, in which the settlement takes place only once a month. A settlement is prolonged over three days. On the first day attention is given to the making-up of accounts. For speculators, this is a very important matter. It is then that they discover the exact amount of "differences," to be paid or received, on running accounts. A speculator has, say, an account open for the rise in a certain stock which he has bought at 80; the stock, at the time of making-up, is 81, and the gross difference due to him is 1 per cent of the amount bought. The real difference is less by the broker's charges. If the stock has fallen to 79, he has to pay a difference of 1 per cent in addition to the broker's charges. On the making-up day, accounts are also carried over, if it be found possible to renew bargains, till the succeeding settlement, when a Contango or a Backwardation (*q.v.*) is charged for the accommodation. Speculators inquire keenly about the state of markets on making-up day, indications being obtainable of the extent and strength or weakness of the speculative account open. As a rule, but not invariably, the account is unwieldy when the contangoes are high, and strong when those charges are low. A. E.

MALA FIDES. See Fides, Bona, Mala.

MALATOLTA, MALETOUTE, MALTOLTE. The origin of Customs Duties (*q.v.*) in England is wrapped in great obscurity. Probably they arose from an early royal right of Prisage and Pre-emption, which developed into Purveyance in the case of domestic produce, and into customs in the case of exports and imports. Originally the charges at the ports were arbitrary and uncertain, but they were gradually limited and fixed by custom. Any charge over and above the customary dues was called *mala tolta*, or evil tax. Thus in art. 41 of *Magna Carta*, merchants are granted freedom to enter and quit the kingdom *sine omnibus malis toltis*. In 1275 the first parliamentary grant of customs is made to the crown, namely half a mark on the sack of wool and on three hundred wool fells, and a mark on the last of leather, and these export duties came to be known as the *magna sive antiqua custuma*. From this time the word maltolte acquires a definite and technical meaning, viz. an additional charge of forty shillings on the sack of wool levied by the arbitrary authority of the king. In this sense it is expressly prohibited in clause vii. of the new articles added to the charter in the great confirmation of 1297. From this time any exceptional charge upon wool, over and above the recognised customs, can only be made by authority of parliament: in other words the *mala tolta* becomes the Subsidies.

[Stubbs, *Select Charters.*—Hall, *The Customs-Revenue of England.*] R. L.

MALCHUS, Karl August von (1770-1840), was minister of the kingdom of Westphalia in the times of Napoleon, and later on minister of finance of the kingdom of Wurtemberg.

He wrote, besides minor works, the *Organismus der Behörden* (organisation of state officials), 1821; the *Politik der inneren Staatsverwaltung* (Policy of the interior administration of the State), 1823; a *Statistik und Staaten Kunde* (The science of Descriptive Statistics), 1826, and his *Handbuch der Finanzwissenschaft und Finanzverwaltung* (Handbook of the science and administration of Finance) 1830, the latter dedicated to the King of Prussia. Roscher considers him as having been a trustworthy official, but deficient in systematisation, range of ideas, and historical knowledge, still trustworthy for information on contemporary institutions and statistics (*Gesch. der Nat. Oek. in Deutschland*, pp. 741-749). He also published in 1838 a survey of the regulations adopted by saving banks throughout Europe, *Die Sparkassen in Europa.* E. Ca.

MALEBRANCHE, Nicolas (1638-1715), a priest of the Roman Catholic church, and a member of the oratory at Paris, was one of the ablest of the followers of Des Cartes, while his ascetic training held him back from being an absolute adherent of his philosophy. Though not himself a direct contributor to economic theory, Malebranche is of interest to the students of economics; his works form a good example of the influence which those whose philosophic thought is deep, but general, may exercise over that special study; he is considered to have inspired Quesnay and his pupil (Victor) Mirabeau with their ultimate postulate of an order of nature, as "the principle and basis of natural rights and natural law" (Mirabeau, *loc. cit. infra*). Quesnay devoted himself during his youth to the study of Malebranche's writings, and Mirabeau quotes the whole of the second chapter of the *Traité de Morale* in the preface to the *Philosophie rurale* (1763), as giving an ideal exposition of "order" as "the central and rallying point of true wisdom." It should be noted, however, that whereas by "order," Mirabeau means the course of "the physical laws of nature," observation of, and obedience to, which is man's "sole and worthy guide"; and apart from which he only "begets abstract and general ideas, and is lost in the crowd of the phantoms of his imagination," he would, had he studied the first chapter, have seen that a recluse like Malebranche virtually took the opposite view. The latter distinguishes "order" from "nature," calling it "l'ordre immuable," knowable only to reason, its subjective counterpart, when sense and imagination are shut out; and to follow which alone is virtue, while to follow nature is sometimes to "wound order." He rejects the stoic identification of following God with following nature, and merely allows, that, "although the order of nature is not precisely our law, and submission to it is in no

way a virtue, it must be observed that one has often to take account of it," *i.e.* when "the immutable order" requires it. Malebranche's order is not the moral order, if positive morality be meant. "Morality changes according to countries and times." It was rather an ideal order, or order of "abstract ethics," viewed as part of the divine plan of the universe, in which spirit was considered almost to the exclusion of anything so transient and uninteresting as matter.

[*Traité de Morale* (1684, 1697, 1707), ed. H. Joly, Paris, 1882.—Cossa, *Introd. to the Study of Political Economy*, London, 1893, p. 266.—Mirabeau, V., *Philosophie rurale*, Paris, 1763.—*Nouv. Dict. de l'Économie politique*, art. "Quesnay."—Bonar, *Philosophy and Pol. Econ.*, 1893, p. 145. See especially Hasbach *On Malebranche's Influence on Quesnay and the Physiocrats.*] C. A. F.

MALESHERBES, Chrétien Guillaume de Lamoignon de (1721-1794), was, under Louis XV., president of the court of Aids and director of the *Librairie* (office of the Censorship, and for licensing the printing of books), evinced a most liberal spirit in these functions, and was exiled from Paris when, in the last years of this reign, the courts of justice were dissolved by authority of the king. Under Louis XVI., Malesherbes was recalled, made a minister at the same time as his friend Turgot (*q.v.*), 1774, and again in 1787; he defended the king during his trial before the national convention. He perished on the scaffold.

Malesherbes, who was a member both of the Paris academy of sciences and of the French academy, has written a great number of memorials and notices on various subjects; only a few of these have been printed. The following should be noticed here: The *Mémoire sur les Moyens d'accélérer l'Économie Rurale en France*, 1790—read before the Royal Society of Agriculture; it insists that the society should establish branches in the provincial towns, so as to be a board of correspondence and of diffusion of useful theoretical and experimental knowledge both for scientific men and resident professional agriculturists—and the *Idées d'un Agriculteur patriote sur le défrichement des terres incultes*, 1791. Waste lands are generally dry and meagre; to bring them under cultivation requires either heavy investments of money, which capitalists are unwilling to supply, or a very strict economy in their working which can only be expected if the labourer himself works for his own profit. The best solution of the problem would be to let such lands to tenants according to the system of *Domaine congéable* (see Land Tenures) used in Brittany.

E. Ca.

MALESTROIT, Seigneur de—(second half of 16th century) member of the royal council of France, and comptroller of the mint (*du fait des monnoies*), was the author of *Les Paradoxes sur le fait des Monnoies* (Paris, 1566).

Malestroit would be quite forgotten if his book had not called forth the celebrated *Réponse* and *Discours . . . pour réponse aux paradoxes du sieur de Malestroit*, by Bodin (*q.v.*). Malestroit maintained that prices had not risen in France for three centuries, goods being always exchanged for the same quantities of gold or silver, the standard of the coins having been lowered in the same proportion as the prices had *apparently* risen. "The metals being the true and just criteria of the high or low prices of things," this lowering would have been harmless for the subjects of the French monarchy if their rebellious temper had not led them to refuse the coins at the value imposed by the lawful will of the sovereign. In fact, Malestroit adheres to the doctrine of some Canonists respecting *valor impositus* and *valor extrinsecus*, and considers coins as purely representative signs of value, destitute of any intrinsic value of their own (see Canon Law).

[Baudrillart, *Jean Bodin et son temps*, 1853, pp. 168-169; see also Malynes.] E. Ca.

MALLET, Jean-Roland (d. 1736), head of the finance department of Louis XIV., under the controller-general Desmarets, by whose orders he wrote:—

Comptes rendus de l'administration des finances du royaume de France pendant les onze dernières années du règne de Henri IV., le règne de Louis XIII., et soixante-cinq années du règne de Louis XIV., avec des recherches sur l'origine des impôts sur les revenus et dépenses de nos rois, depuis Philippe le Bel jusqu'à Louis XIV., et différents mémoires sur le numéraire et sa valeur sous les trois règnes ci-dessus. Paris, 1720. Reprinted by Necker with pref. and introd., 1789. A. L.

MALLET, Sir Louis (1823-90), grandson of Mallet du Pan, and son of John Lewis Mallet, who was placed by Pitt in the audit office about 1800, entered the same office in 1839, and in 1847 the board of trade. In 1860 he was appointed an assistant commissioner for drawing up the tariff under the treaty of commerce with France. He was made a member of the council of India in 1872. In 1875 he became permanent under secretary of state for India and had a leading share in the reconstruction of the customs tariff. He was a bimetallist.

His son Mr. Bernard Mallet collected his articles and pamphlets, *Free Exchange* (1891)—and wrote *Sir Louis Mallet: a Record of Public Service and Political Ideals* (1905). H. R. T.

MALLET DU PAN, Jacques (1749-1800), born near Geneva, died in England, collaborated with Linguet in his *Annales*, to which he published a supplementary series *Mémoires historiques, politiques et littéraires* (1779-82). He went to Paris in 1784 and contributed to the *Mercure de France*, in which his account of the debates of the assembly in the early revolutionary period is very valuable. He also edited *Journal historique et politique de Genève* (Paris, 1784-88). He came to England in 1798, where he made many friends and founded the *Mercure Britannique* (1798-1800).

Besides some economic contributions to the above-mentioned periodicals, Mallet du Pan added

notes to the translation from the English of *Remarques sur le tarif du Traité de commerce conclu entre la France et l'Angleterre* (Paris, 1788, 8vo). H. R. T.

MALLET, P. H. (1730-1807), a professor at Geneva, wrote *De la ligue Hanséatique*, Genève, 1805, 8vo., which only claims to be a résumé and not a history. H. E. E.

MALON, BENOÎT (1841-1893). Born in a village of central France, he made his way to Paris as a workman, and from 1866, the year of his affiliation to the INTERNATIONAL, took an active part in most of the strikes and republican manifestations during the later years of the empire. A member of the COMMUNE (*q.v.*) of Paris, 1871, Malon escaped after its suppression, to Geneva, and studied the works of the leading sociologists and economists. Of these, J. Stuart Mill appears to have been his favourite author. He then began to write on social subjects; in this he was indefatigable; and, returning to France, founded the *Revue Socialiste*, of which he was editor. This publication is the organ of the so-called French scientific socialists.

As stated in his last book *Le Socialisme Intégral* (1892), Malon's views may be summarised as follows. He agreed with MARX that the working class is at the present time the victim of a financial and industrial capitalism, founded through an abuse in the appropriation of part of the produce of labour. He demurs to Marx's statement that in its course the whole history of mankind has always been determined by purely economic and materialistic causes; he asserts that idealistic motives have also often inspired great historical movements. Consequently for him, socialistic reforms, to be complete, must be "integral," in other words give satisfaction to "all the sentimental and moral forces which reside in the human soul." His ultimate aim is the socialisation of all the agents of production. This would produce a state of social organisation where "the means of production will be in common, the produce distributed according to justice, and consumption remain free." Deprecating violence, Malon urges as a transitional measure the immediate resumption by the state of banks, railways, mines, and quarries, and the municipalisation of gas and water companies, tramways, and even cabs, as well as the foundation of a ministry of labour and an eight hours bill. For a self-taught man, the extent of Malon's reading was really considerable, though his inquiries into the conditions of life during the middle ages strike the reader by want of insight. This is no doubt due to his passionate antagonism to the Church.

Besides the *Socialisme Intégral*, Malon published *l'Internationale, son histoire et ses principes* (1872).—*Spartacus* (1873).—*l'Histoire critique de l'Économie Politique* (1876).—*l'Histoire du Socialisme* (5 vols. 1882-85)—a French translation of Lassalle's *Arbeit und Capital*, and of Schaeffle's *Quintessenz des Socialismus*, and contributed numberless articles to socialistic reviews and newspapers. E. CA.

MALOUET, PIERRE-VICTOR, Baron (1740-1814), was a distinguished naval and colonial administrator, the minister and friend of Louis XVI. In 1763 he entered the Admiralty, and was sent to Rochefort, where he superintended the embarkation of the expedition for colonising Guiana. He was sub-commissioner and intendant at San Domingo from 1767 to 1774, and it was here that he prepared the materials for his subsequent work on colonial administration. He came under the notice of M. de Sartines, who entrusted him with the examination of the projects submitted for the colonisation of Guiana. Malouet, now naval commissary-general, obtained the adoption of his own views, and was sent to Cayenne charged with their execution. In 1779 he was recalled, but his schemes were carried out by the engineer Guisan, to whom he had explained them.

In 1780, after negotiating a loan of £6,000,000 from the Genoese, he was appointed naval intendant at Toulon; an office he retained for eight years. In 1789 he was elected deputy for Riom. He continued to be a firm adherent of the Bourbon cause, and an admirer of the British constitution. In 1792 he was obliged to seek refuge in England. In 1801 his advice was courted as to the best way of reorganising the French navy. He was appointed naval commissary-general, and in 1803 was sent to superintend the new arsenal at Antwerp. Here he remained for six years, directing the immense naval undertakings and co-operating in the measures which obliged the English to withdraw from Walcheren. In 1810 he was nominated counsellor of state, but in 1812 his independent expression of opinion caused him to be exiled from Paris. In 1814 he was once more entrusted with the administration of the navy, but he died before he could complete the work.

Malouet wrote:—*Mémoire sur l'esclavage des nègres*, Paris et Neufchâtel, 1788, 8vo.—*Lettres à ses commettants*, 1789, 8vo.—*Mémoires sur l'administration de la marine et des colonies*, 1789, 8vo.—*Opinion sur les mesures proposées par MM. de Mirabeau et de Lameth, relativement à la sûreté intérieure et extérieure du royaume*, 1789, 8vo.—*Collection de ses opinions à l'assemblée nationale*, Paris, 1791-92, 3 vols. 8vo.—*Défense de Louis XVI.*, 1792, 8vo.—*Examen de cette question: Quel sera pour les colonies de l'Amérique le resultat de la révolution française, de la guerre qui en est la suite, et de la paix qui doit la terminer?* Paris, 2nd ed., 1796, 8vo (1st ed., London).—*Lettre à un membre du parlement sur l'intérêt de l'Europe au salut des colonies de l'Amérique*, 1797, 8vo.—*Collection de mémoires et correspondances officielles sur l'administration des colonies et notamment sur la Guiane française et hollandaise*, Paris, an X. (1802), 5 vol. 8vo, avec cartes et plans.—*Considérations historiques sur l'empire de l'armée chez les anciens et les modernes*, Anvers, 1810, 8vo. A. L.

MALT SILVER is defined by Jacob under the name of *malt-scot* as money paid for making

malt. *Scot* is A.S. *sceat* = money. In the custumal of Meopham, Kent, it occurs in the form of *malt-gavel*, and in the rental of Eastry in the same county as *malt-rent* and *malt-penny*. Those who owed service to the lord of the manor were obliged to use the village mill or pay a fine. Prof. Thorold Rogers, in *Agriculture and Prices in England*, gives the prices paid for the manorial service of making malt for several years between 1270 and 1400, chiefly from the south-eastern counties. These prices vary from 1d. a quarter in 1270 to 6d. in 1361, and 2d. in 1380. The mill being the franchise of the lord, he paid no fixed price for the service, and hence the variation in payments. Malt silver, which is money paid by, not to, the tenant, if connected with this service of making malt, means the fine paid to the lord for exemption therefrom. The word silver, however, in compound words has generally the meaning of toll, and malt silver or scot was more probably the fine paid by tenants for liberty to make their own malt.

[Jacob's *Law Dictionary*. — Somner, W., *Treatise of Gavelkind* (1660).—Thorold Rogers, *The History of Agriculture and Prices in England*, i. ii. (1866).] M. T. M.

MALT TAX. See TAXATION.

MALTHUS, THOMAS ROBERT (1766-1834). The name appears variously in parochial registers, but the form Malthus is as old as the 15th century, and the two branches of the family, the Yorkshire and the Berkshire, can be traced from that date. The economist belongs to the Berkshire branch, to which also most probably belonged Francis Malthus, the author of a book in French and in English on *Military Fireworks* (1629, etc.), and Thomas, the publisher and printer (end of 17th century). The great-grandfather of the economist was Daniel Malthus, Queen Anne's apothecary, and the friend of Sydenham the physician, after whom he named his only son Sydenham. The son of Sydenham Malthus, Daniel, father of the economist, was a man of considerable attainments. He corresponded with Voltaire, and was the literary executor of Rousseau. On his little estate, the Rookery, near Dorking in Surrey, his second son, Thomas Robert, was born. Thomas Robert was educated first under the Rev. Richard Graves at Claverton, near Bath, and then under Gilbert Wakefield in his private school at Nottingham. In 1785 he went to Jesus College, Cambridge, where he took his degree (B.A.), and was ninth wrangler, in 1788. He became fellow of his college in 1797. In all his early life Malthus was brought into close contact with the supporters of radical not to say revolutionary views; and his father was a zealous partisan of the new doctrines. Yet the son, when he first thought of authorship in 1797, and wrote the *Crisis*, a political pamphlet never published, was a cautious and moderate whig, as he remained all his life. He took orders and a curacy at Albury, whither his father had removed in 1787. Godwin's *Enquirer* (1797) was naturally a topic of conversation between father and son; their discussion "started a general question of the future improvement of society; and the author at first sat down with an intention of merely stating his thoughts to his friend, upon paper, in a clearer manner than he thought he could do in conversation. But, as the subject opened upon him, some ideas occurred which he did not recollect to have met with before" (Preface to Essay, 1798), and he accordingly wrote and published a book called *An Essay on the Principle of Population as it affects the Future Improvement of Society, with remarks on the Speculations of Mr. Godwin, M. Condorcet, and other Writers.*

In his preface (dated 7th June 1798) the then anonymous author says he has "read some of the speculations on the future improvement of society in a temper very different from a wish to find them visionary," but he sees "great and unconquerable difficulties" in the way of human improvement (p. 7). The power of population is indefinitely greater than the power in the earth to produce subsistence for man (p. 13). This proposition depends on the two "postulata": i. "That food is necessary to the existence of man; ii. that the passion between the sexes is necessary, and will remain nearly in its present state" (p. 11). "Population, when unchecked, increases in a geometrical ratio. Subsistence increases only in an arithmetical ratio" (p. 14); but, "by that law of our nature which makes food necessary, the effects of those two unequal powers must be kept equal" (p. 14). Writers like Adam SMITH, HUME, and especially WALLACE (p. 8), have seen this before; but they have not shown the way in which the levelling must take place. There is a constant check on population from the difficulty of subsistence. It is no difficulty peculiar to man. The race of plants and the race of animals experience it; nature scatters the seeds of life profusely, but is sparing in the nourishment necessary for the rearing of them; the results are waste of seed, sickness, and premature death. Among mankind the effects are misery and vice—the former certain, the latter probable (pp. 15, 16). In no place and at no time "has the power of population been left to exert itself with perfect freedom" (p. 19). The manners have never been so pure and simple or the food so abundant that no check has existed to early marriages "among the lower classes from a fear of not providing well for their families, or among the higher classes from a fear of lowering their condition in life" (pp. 18, 19). Yet in all societies the instinct is so strong that there is "a constant effort towards an increase of population. This effort as con-

stantly tends to subject the lower classes of society to distress, and to prevent any great permanent amelioration of their condition" (p. 29). It results in oscillations between comparative comfort and distress—the distress caused by the increase of population due to previous comfort, and the comfort caused by the thinning down of the previous excess of population (pp. 29-31). This phenomenon is veiled by the difference between nominal and real wages, and it is subject to many other "interrupting causes" in modern times. But the general principles remain true of all states of mankind, the savage and barbarian (ch. iii.), and the European (ch. iv.), including England. Where the positive check, repressing an increase already begun, is not traceable (p. 71), there is the preventive, which "operates in some degree through all the ranks of society in England" (p. 63). Even the lowest classes have a love of independence and fear of letting their families sink in the scale of comfort. "The parish law of England, it must be confessed, is a system of all others the most calculated gradually to weaken this sentiment" (p. 68). The poor laws "tend to depress the general condition of the poor"—(1st) by tending to increase population without increasing food; (2nd) by diminishing the share of the industrious (pp. 83, 84). They have contributed to raise the price of provisions, and lower the real price of labour (p. 86). Mr. Pitt's Poor Bill (then under discussion, 1797-98) has the defect mentioned; it tends to increase population without increasing the food (p. 94; cp. p. 134).

That these checks are the true causes of the slow increase of population in Europe is shown, Malthus thinks, by the comparatively rapid increase that follows the removal of them. In a new colony, as in America, there is much room and food, and the "knowledge and industry of an old state operate on the fertile unappropriated land of a new one" (p. 137). "Throughout all the northern colonies the population was found to double itself in twenty-five years" (p. 105), in some even in fifteen (p. 106), while the settlements first colonised increased slowly or came to a standstill (p. 107). WALLACE and CONDORCET are both wrong in supposing that the difficulty of an "overcharged population" can only occur in a very remote future (p. 142 *seq.*). It has always been felt, and is felt now (cp. p. 153). Condorcet's plan for providing every one with a comfortable provision for a family would only lead to a greater increase of population (p. 150). Condorcet's idea of the "organic perfectibility" of the race, including the indefinite lengthening of life, is not founded on scientific argument, that is to say, on observed facts (pp. 157, 158). By attention to breed, and condemning all the bad specimens to celibacy, no doubt "a certain degree of improvement similar to that among animals might take place among men" (p. 170). Otherwise the increase in longevity would only give greater weight to the "argument of population" (p. 171). GODWIN'S system of equality, to be produced by reason and conviction, "wears much more the promise of permanence than any change effected and maintained by force" (p. 174). But Godwin dreams that all can live in the midst of plenty and share alike in the bounties of nature (p. 178), all causes of misery and vice being removed, reason governing instead of passion (p. 180 *seq.*), useless luxuries being abandoned unanimously, and "the spirit of benevolence, guided by impartial justice, dividing the produce among all the members of the society according to their wants" (p. 182). Such a society would tend even more than a new colony to favour population, especially as Godwin would abolish the form of marriage; and, in spite of the increased production due to a better distribution of property, there would be such a growth of numbers that the new equality would disappear, and the old struggle, as well as the old inequality, would come back (pp. 180-190, cp. pp. 194-198). A cause of distress is at work here which cannot be traced to human institutions, but is due to human nature itself (p. 191); and Godwin's "society without government" would feel the force of it as much as the present societies with governments. It would be found necessary in Godwin's society to put some check on population, and the most natural and obvious would be "to make every man provide for his own children" (p. 199). "And thus it appears that a society constituted according to the most beautiful form that imagination can conceive, with benevolence for its moving principle instead of self-love, and with every evil disposition in all its members corrected by reason and not force, would, from the inevitable laws of nature and not from any original depravity of man, in a very short period degenerate into a society constructed upon a plan not essentially different from that which prevails in every known state at present, I mean a society divided into a class of proprietors and a class of labourers, and with self-love for the mainspring of the great machine" (pp. 206-207).

But the same argument which proves that Godwin's society would collapse if founded, serves also to prove that it never could be founded at all (p. 210 *seq.*). The passion between the sexes shows no tendency whatever to disappear, and we have no reason to believe with Godwin that in the future it will be the obedient servant of cool intellect. It is also a passion perfectly in harmony with the nature of man, and in no wise an evil in itself (pp. 211-216).

After disposing of Godwin's attempts to prove the indefinite physical improvement and lon-

gevity of man (ch. xii.), Malthus finds fault with the abstract character of his reasoning (ch. xiii.), and points out how subordinate is the part played by mere reasoning in the affairs of life. The later discussions in the *Essay* (*e.g.* ch. xiv. on "Perfectibility," etc.) add nothing essential to the main arguments, though there are remarks on wages, wealth, and capital of importance in view of his general economic doctrines (*e.g.* ch. xvi. 321 ; ch. xvii.). After telling us how Dr. Price had unwittingly been the means of convincing him of the truth of his new views on the ratios of increase, Malthus concludes his book with a brief statement of his own philosophical view of the world. The world is to man a state of trial ; without the wants of the body, and the difficulty he finds in supplying them, his intellect would not be developed. The law "that population should increase much faster than food" (p. 361) is calculated to produce exactly the strong stimulus that was needed for intellectual activity as well as for industry of any kind. In the same way moral evil seems necessary to the creation of moral excellence (ch. xix.).

The *Essay* of 1798 was anonymous, but it made a great sensation, and its author was soon known. Godwin and he met in London in August 1798, and a correspondence followed, of which something is given in Godwin's *Life* (ch. i. p. 321). The arguments of Godwin and others made some impression ; and in thinking of a new edition the "author of the essay" revised his work not only by the aid of travels of his own in 1799 and 1802, but in the light of abundant criticism poured upon him from all sides. *An Investigation of the Cause of the present High Price of Provisions* (1800) contained a promise to make the *Essay* bear more directly on present society, as well as to illustrate its principle "from the best authenticated accounts we have of the state of other countries" than England. Accordingly in 1803 Malthus published under his own name the stout quarto that embodies his mature views of his subject (*An Essay on the Principle of Population, or a view of its past and present effects on Human Happiness*, a new edition, very much enlarged). Besides hearing of vice and misery, we now hear of moral restraint as a check on population. "Of the preventive checks, that which is not followed by irregular gratifications may properly be termed moral restraint" (2nd ed., p. 11). The author confesses in his preface that he had taken too gloomy a view of human nature in his first essay. Accordingly, in this second, an allowance is made throughout for the influence of moral restraint. In the fourth book there are two chapters entirely devoted to this subject. He recommends a "virtuous celibacy," a "prudential restraint," a "period of delayed gratification," the result of which, if generally adopted, would be (he thinks) that "all squalid poverty would be removed from society, or at least be confined to a very few who had fallen into misfortunes against which no prudence or foresight could provide" (p. 495). Whatever may be thought of the possibility of the general observance of such a rule of conduct, there is no doubt that Malthus sincerely believed that the chastity he recommended "has the most real and solid foundation in nature and reason, being apparently the only virtuous mean of avoiding the vice and misery which result from the principle of population" (*ib.* p. 496).

Apart from this introduction of moral restraint, the principles of the first essay remain unaltered. But the application is different. Instead of very general illustrations, there are now detailed descriptions of typical savage, barbarian, and civilised countries, drawn from a wide range of authorities. These occupy more than half of the book. The utopias of Godwin and Condorcet are dismissed in three short chapters (pp. 354-386), after which emigration and the poor laws are discussed, and the author slides into what may be called economics proper, the relations of wealth to wages, of commerce to agriculture, and the effects of bounties on corn. Various aspects of the principle of population, especially its bearings on charity and on civil liberty, are then considered. With all its qualifications of the theory of the first edition, this second gave much offence by some indiscreet phrases and illustrations. The solemn contrast of the matron and the maiden lady, to the advantage of the latter, occurs in the second edition, pp. 549-550; and disappeared afterwards. The famous passage, describing "nature's mighty feast" and the uninvited guests, occurs there too, in connection with civil liberty (bk. iv. ch. vi. p. 531). It involves a denial of the *right* to support, in the strict sense of the word *right;* and, though it occurs only in this edition of the Essay, Malthus never abandoned the position maintained in it. He considered that our poor laws, in conceding the right, were "attempting to reverse the laws of nature." Hence his proposal that public notice should be given that no child born of any marriage taking place after a year from the said notice, and no illegitimate child born two years from said notice, should be entitled to parish relief,—also that the clergy when conducting the marriage service should call the attention of the husband to his obligation to support his own children and the wrongfulness of his marrying without a fair prospect of being able to support them (bk. iv. ch. vii. p. 538). He does not approve of the prohibition of marriage by the state even where there is no such prospect ; it is enough to leave foolish men to the "punishment provided by the laws of nature" (p. 539).

There was much opposition to the views of

the essay. Many of the replies to it are largely rhetorical and do not concern us here. Malthus disposed of his critics very temperately in the successive appendices to his various editions. The substantial soundness of his main positions is not disputed by economists now, and his influence on the study of statistics is admittedly great. The effect of his essay and other works on general economic speculation will be considered below.

But the essay seems fairly open to the following comments.

1. The necessity of food and the necessity of the instinct of sex, his two postulates, are not equally absolute.

2. The growth of population and the increase of food are not well illustrated by a mathematical formula (geometrical and arithmetical ratio) which suggests greater exactness than the case allows.

3. The expression "tendency" is not applicable to the growth of population in the same sense as to the increase of food. Malthus admits this, but not perhaps with sufficient prominence and frequency.

4. The periods of the doubling of population and of the doubling of food are stated too absolutely, in so far as the idea is sometimes conveyed that, without respect of climate, race, and country, the periods will be nearly the same for all human beings, if only the moral, political, and social conditions are identical.

5. Malthus often speaks as if population must always increase up to the limits of the food as soon as these are sufficient to secure the standard of living (cp. *Tract on Rent*, p. 8). But such an instance as France shows that the standard may be secured and yet no increase take place. Hence it is not evident now, whatever it was in his days, that all countries feel the pressure of population, except in the sense that all either exercise preventive checks or suffer from the positive.

6. The argument of the biologists, expounded by Mr. Herbert Spencer, would show that possibly in the future the intellectual energies of man may grow at the expense of the sensual. The basis of this argument, however, is not very firm (see POPULATION).

7. Malthus proposed late marriages as a remedy for over-population; the neo-Malthusians, admitting the full force of his general argument, propose as a remedy early marriages with restriction of family (see BRADLAUGH; James MILL; PLACE). The name Malthusian in its widest sense is applied to all who recognise the existence and the need of any checks on population.

The first achievement of Malthus was the exposition of the theory of population; and his name has been associated so closely with this theory that, like Darwin's, it has added a new adjective to the language of civilised peoples. His second achievement was his contribution to the economic doctrine of rent.

When the East India Company resolved in 1805 to found a College at Haileybury (Hertford) for the preparation of their cadets, they made Malthus their first professor of history and political economy, and he began his duties at the opening of the college in 1807, continuing till his death in 1834. He twice appeared in print in defence of his college against the criticisms of Lord Grenville and others. He lived at Haileybury very contentedly and industriously, and was blessed with good physical health all his life. The pamphlet on the *Nature and Progress of Rent* (1815) contains the substance of lectures delivered at Haileybury (see "Advertisement," or preface, of the pamphlet). Malthus had intended to keep these notes till he could include them with others in a regular treatise on political economy; but the agitation on corn duties, which was then at its height and had already drawn from him one pamphlet, induced him to follow it up by this other. In the first (*Observations on the Effects of the Corn Laws*, 1814) he had stated the arguments for and against protection of agriculture, holding the balance between the two opinions, but hinting that the political dependence caused by a free trade was a serious evil, and that agriculture was more important than manufacture. In a third pamphlet (*Grounds of an Opinion on the Policy of Restricting the Importation of Foreign Corn*, 1815), he plainly advocated a temporary protection, to keep up prices in order to keep up high farming. Between the two others came the tract on *Rent*, of much more consequence than either. "The rent of land," he says, "is that portion of the value of the whole produce which remains to the owner of the land after all the outgoings belonging to its cultivation, of whatever kind, have been paid, including the profits of the capital employed, estimated according to the usual and ordinary rate of the profits of agricultural stock at the time being." This is the point towards which actual rents are constantly gravitating; and the immediate cause of rent is the excess of price above cost of production. How is such excess possible? It is not due, as SAY and BUCHANAN think, to the monopoly of property, though the idea is sometimes countenanced by Adam SMITH, but to three causes: (1) that the soil yields more than enough to support the cultivator; (2) that the food and materials thus procured cause an increase of population in proportion to them; and (3) that the fertile lands are comparatively scarce, (p. 8, cp. p. 10). Hence the paradox that "the cause of the high price of the necessaries of life above the cost of production is to be found in their abundance rather than their scarcity" (p. 13). In the case of real monopolies like choice

vineyards, the supply does not raise up its own demand. It is otherwise with agriculture, where a lessened fertility diminishes the demand by diminishing the population. On the other hand, where fertile lands are to be had in abundance, as in the earlier periods of society or in the colonies (p. 17), the result is high wages and profits, but little or no rent. But the diversities of soil make their effect felt as time goes on. "The accumulation of capital beyond the means of employing it on land of the greatest natural fertility and the greatest advantage of situation must necessarily lower profits, while the tendency of population to increase beyond the means of subsistence must, after a time, lower the wages of labour" (p. 17). The cost of production will thus fall; but the value of the product will rise, and its rise creates an excess which is rent (p. 18). "The separation of rents as a kind of fixture upon lands of a certain quality is a law as invariable as the action of the principle of gravity." Rents are thus due not to human artifice but to the laws of nature (p. 20).

The rise and fall of rents are governed by the four causes of the diminution of cost of production—(1) accumulation of capital and consequent fall of profits; (2) increase of population and consequent fall of wages; (3) agricultural improvements and consequent diminution in the number of hands needed; (4) increase in the price from increased demand, especially in a manufacturing nation, and consequent lowering in the *proportion* of cost to price (p. 22). But these causes need not act together (p. 26, cp. p. 34).

The general principle is true that "rents naturally rise as the difference between the price of produce and the cost of the instruments of production increases" (p. 27). It is also true that "a progressive rise of rents seems to be necessarily connected with the progressive cultivation of new land and the progressive improvement of the old," while "a fall of rents is as necessarily connected with the throwing of inferior land out of cultivation and the continued deterioration of the land of a superior quality" (p. 32). It follows also that "the price of produce in every progressive country must be just about equal to the cost of production on land of the poorest quality actually in use, or to the cost of raising additional produce on old land, which yields only the usual returns of agricultural stock with little or no rent" (p. 35, p. 36). "Corn, in reference to the quantity actually produced, is sold at its necessary price like manufactures" (p. 39). It is as with machinery in manufactures; when improvements are introduced but not carried out universally, the employers of the improved machines will reap surplus profits (cp. p. 55 note), the manufactured article being demanded in greater quantities than the improved machines can supply, and the price being accordingly fixed by the cost of producing the article by means of the old fashioned ones (cp. pp. 37-39, 41, 45).

The Law of DIMINISHING RETURNS was thus clearly formulated in this tract on rent. Though logically implied in the theory of population, it was not expressly stated in the essay of 1798; there are hints of it (especially p. 46 for extensive cultivation, pp. 90 and 107 note for intensive, cp. 186-188). The 2nd edition of the essay (1803) is somewhat clearer on the subject (p. 5 for intensive, p. 7 extensive, cp. the comment on ANDERSON, p. 472). The essay did not contain the author's mature views on rent till its 5th edition (1817). These views appear also, as might be expected, in the *Political Economy* (1820 and 1836). They were very little affected by the long correspondence of Malthus with Ricardo on the subject, still less by the public criticisms of the latter and of M'Culloch, Torrens, and many others. The view of Malthus that agricultural improvements raised rents has on the whole been justified by experience rather than Ricardo's to the contrary effect.

The bearing of the law of population on wages is so close that this subject occupied the thoughts of Malthus from the first. He observes (Essay, 1798, p. 35), that "the want of freedom in the market of labour, which occurs more or less in all communities, either from parish laws or the more general cause of the facility of combination among the rich, and its difficulty among the poor, operates to prevent the price of labour from rising at the natural period, and keeps it down some time longer, perhaps till a year of scarcity, when the clamour is too loud and the necessity too apparent to be resisted." "It must have risen long before, but from an unjust conspiracy" of the rich (*ib.* p. 36). He starts therefore with no class prejudices in favour of the employer but his "principle of population" compels him to believe that "no possible form of society could prevent the almost constant action of misery upon a great part of mankind if in a state of inequality, and upon all if all were equal" (p. 36). Even though an English labourer does not marry without reflection, or at the earliest possible age, he does so soon enough and improvidently enough to find his children more sickly than those of the richer classes. The healthiness of a country life is proverbial; yet "the lads who drive plough are very rarely seen with any appearance of calves to their legs" (p. 73). Combination itself, which, he allows, might quite possibly secure a shorter day's labour (of 6 or 7 hours) to the labourers without prejudice to production (p. 298, cp. p. 301), would hardly stand against

the necessities of the poorest. "Those that had large families would naturally be desirous of exchanging two hours more of their labour for an ampler quantity of subsistence," and it would be "a violation of the first and most sacred property that a man possesses to attempt by positive institutions to interfere with his command over his own labour" (p. 299).

Real wages ("the comforts of the labouring poor") depend on the "funds destined for the maintenance of labour and will be very exactly in proportion to the rapidity of this increase" (p. 305), but Adam Smith was wrong in supposing that whatever increases "the revenue or stock of a society" increases these funds. It is not so unless the additional revenue is convertible into a proportional quantity of food; and this last is true in agriculture but not in manufacture (p. 306 *seq.*).

A rise of wages caused by an extension of manufacture will be merely nominal if there is no proportional increase of provisions (p. 307), for then the price of provisions will rise and the real wages remain as they were before. Importation can never in a large country like ours be sufficiently great to prevent this (p. 311). Hence Malthus thinks Dr. PRICE might have plausibly supported his view of the depopulation of England by arguing that the increased trade and manufacture created no new supplies of food, and therefore provided for no increased numbers (pp. 312, 313). In this respect Malthus is physiocratic (p. 327); and, in the first essay at least, he supposes wages to be close to the physical necessaries of life, and the most important of these to be bread. He is consistently physiocratic too in reckoning manufacture unproductive to society in comparison with agriculture (p. 333), though often very remarkably productive to individuals (p. 334). In later works he makes much more ample allowance for the difference between a high and a low standard of living, as affecting wages and population.

His maturer views of wages were developed with constant reference to the rival theories of RICARDO. Malthus refused to consider mere necessaries "the natural price of labour"; that is a "most unnatural" price, for it implies a stationary society and standard of comforts. The true definition of natural wages is "that price which in the actual circumstances of the society is necessary to occasion an average supply of labourers, sufficient to meet the average demand" (*Pol. Econ.*, 1820, p. 247). The market rate is sometimes above and sometimes below this point. The resources of the country and the demand for labour may increase; and then the rate of wages goes up, and the habits of the people will be probably so affected that a higher standard of comfort will be adopted; or they may stand still or decrease, and the rate go down and the standard of comfort be lowered. A high standard of comfort is the effect as well as the cause of high wages (*ib.* pp. 248-249, 256-257). The standard is now so complex that happily wages do not depend wholly on the price of corn (*Pol. Econ.*, 1820, p. 291). By high and low wages Malthus does not mean, like Ricardo, a high or low proportion to profits, but a greater or a less command of the comforts of life (*ib.* pp. 91, 326, 327, 214 n. etc.).

The relation of wages to capital (defined as "that particular portion" of material wealth, "which is destined to be employed with a view to profit," *Pol. Econ.*, 1820, p. 293) is not regarded as one of simple dependence; the demand for labour depends not only on capital but on revenue (pp. 248, 261, 301 n.). Here as elsewhere Malthus objects to the Ricardian neglect of "demand" and exclusive attention to "supply." Nevertheless he allows that the proportion which capital, whether fixed or circulating (p. 261) bears to labour has a very important influence both on wages and profits (pp. 301, 302). He did not formulate the theory of a WAGES FUND; but he was to some extent the cause of it (see especially *Pol. Econ.*, 1820, pp. 301 *seq.*, a good example of the abstract or deductive method). He even states that "if the market were comparatively understocked with labour, the landlords and capitalists would be obliged to give a larger share of the produce to each workman. Every effort to ameliorate the lot of the poor generally, that has not this tendency, is perfectly futile and childish. It is quite obvious, therefore, that the knowledge and prudence of the poor themselves are absolutely the *only* means by which any improvement in their condition can be effected. They are really the arbiters of their own destiny; and what others can do for them is like the dust of the balance compared with what they can do for themselves" (p. 306).

But profits do not depend, as Ricardo supposes, purely on the cost of obtaining the labourer's necessaries, any more than the value in exchange of commodities generally depends wholly on their cost in labour. Ricardo takes demand as constant, and explains all values by the cost of their supply (pp. 308-11, etc.; but see RICARDO).

Malthus differed from what he called the new school of political economy (see *Quarterly Review*, January 1824), meaning Ricardo and his followers M'Culloch and James Mill, in regard to their three main principles. The first was that the natural or normal value, in exchange, of a commodity is determined by its cost, and that its cost means labour. The second, that demand affects values very little or not at all. The third, that profits are determined not by competition of capitalists but

by the fertility of the least fertile land which it is worth while to cultivate. Thus in value profits play so small a part that they may be neglected. Malthus questions all three of these propositions. Cost, or as he prefers to say, the "conditions of supply," includes a reference to demand and supply; "natural prices" are "regulated by the ordinary and average relation of the demand to the supply" instead of their extraordinary and accidental relations (*Political Economy*, 1820, p. 84). Profits also must enter into the conditions; and the "varying quickness of their returns" is of importance in the determination of prices (*ib.* p. 88, cp. *Tract on Value*, p. 12 n.). "The articles which were of a nature to require a long preparation would be comparatively very scarce, and would have a great exchangeable value in proportion to the quantity of labour which had actually been employed upon them, and on the capital necessary to their production" (*ib.* p. 89). The varying proportions of fixed capital entering into different commodities were recognised by Ricardo himself as requiring a qualification of his principle (*ib.* p. 90, see RICARDO).

Malthus attached great importance to the search after a measure of value; and the lukewarmness, as well as scepticism, of Ricardo on the subject is partly explained by the fact that Ricardo had not a "historical mind." Malthus was anxious to have a key to the interpretation of economic history, especially the statistics of prices and wages in past times, and particularly since 1790. In his *Political Economy* (1820) he thought that a mean between corn and labour was the measure he desired (pp. 132, 133), except for corn itself, of which the best measure was the labour commanded. In his tract on the *Measure of Value* (1823) he confesses that he was wrong (p. 23 n.) and that "labour alone is the true measure." He quotes Ricardo's dictum "in all countries and at all times profits depend on the quantity of labour requisite to provide necessaries for the labourers on that land or with that capital which yields no rent," only to deduce from it the constant value of labour (*Value*, p. 29 n.); and thinks that if the value of labour be constant, labour is capable of being used as a measure of all other values (cp. pp. 30, 31). "The labour worked up in a commodity could not in many cases be ascertained without considerable difficulty; but the labour which it will command is always open and palpable" (p. 54 n.). This was Adam Smith's doctrine, though he was not always consistent. Malthus may be more consistent, but he was hardly more successful in the practical application of labour as a measure of value. Ricardo's attitude of suspense and scepticism seems justified. In our own time Professor Marshall (Gold and Silver Commission, evidence, December 1887, final report, pp. 1, 3) uses labour as a measure of the value of gold, but does not put it forward as a universal measure.

It was obvious, of course, that the precious metals had no constant value; and the question of the changes in the value of gold and silver was pressed on the attention of all economists at the epoch of the great war. The fluctuations of general prices from the war and of corn from the seasons were complicated by variations due to the state of the currency, and especially to the suspension of cash payments authorized in 1797 and continued till 1821. An economist who had lived through the first two decades of the new century would necessarily be expected to have an opinion about the cause of the high price of food in 1800, about the effect of the CONTINENTAL SYSTEM 1806-12, about the disappearance of guineas in those times, about the Bullion Committee 1810 (see BULLION COMMITTEE, REPORT OF), and about a "general glut" after the war.

From the end of 1808 the foreign exchanges had become very unfavourable to this country, and the bullion committee reported in 1810 that this low state of the continental exchanges, together with the high price of bullion, measured in notes, was caused by "an excess in the paper circulation," due originally to the suspension of cash payments. Malthus and Ricardo agreed with this conclusion, but differed about the general relation of currency to the exchanges. Ricardo considered that "the exportation of the coin is caused by its cheapness, and is not the effect but the cause of an unfavourable balance" (*Works*, p. 268). Malthus thinks, on the contrary, that the unfavourable balance might be due to purely commercial causes, of which the exportation of gold and silver would be only the effect. A view very like Ricardo's has been maintained by Professor Marshall before the Gold and Silver Commission (*Evidence*, final report, December 1887 and January 1888, pp. 11, 48-50); but economists have not yet reached unanimity on the subject.

In regard to the apparent general glut that followed the war, it was the view of Malthus (see *Political Economy*, 1820) that a general over-production had really occurred, and was the explanation of general low prices; a certain amount of luxurious living was, he thought, really good for trade. Consumption must keep pace with production; in England in his day the latter seemed to him to have outstripped the former. J. B. Say (*Lettres à M. Malthus*, 1820), Ricardo, and James Mill were no doubt right in pointing out that general could not mean universal, for supply involves demand. But they were wrong in leaving the impression that particular cases of over-production could never be numerous enough to cause any wide distress; and it seems fair to say that the theory of population can bear

to be applied on the one side or the other with equal plausibility.

The theory of population remained after all the greatest achievement of Malthus; and this notice of him may be fitly concluded by some account of his applications of it to the poor law.

"To remedy the frequent distresses of the common people," he wrote in 1798, "the poor laws of England have been instituted; but it is to be feared that though they may have alleviated a little the intensity of individual misfortune, they have spread the general evil over a much larger surface." He adds that it is often remarked with surprise that, notwithstanding the immense sum, nearly three millions, that is annually collected for the poor in England, there is still so much distress among them. "Some think that the money is embezzled, others that the church wardens and overseers consume the greater part of it in dinners. All agree that somehow or other it must be very ill managed" (*Essay*, p. 74). But, if there were a rate of 18s. in the £1 instead of 4s., the case would not be materially different. If wages were from 1s. 6d. a day made up to 5s., the labourers, it might be said, could then eat meat every day. But the transference of 3s. 6d. to every labourer would not increase the stock of meat, but by increasing the number of buyers would simply raise the price. If it caused more cattle-rearing, there would be less corn-growing, and corn would rise (pp. 75, 76). "When subsistence is scarce in proportion to the number of people, it is of little consequence whether the lowest members of the society possess 1s. 6d. or 5s. They must at all events be reduced to live upon the hardest fare and in the smallest quantity." Moreover, there would on the first receipt of the additional wages be less inclination for work and a greater impulse to an increase of numbers (pp. 76, 77). "I cannot by means of money raise a poor man and enable him to live much better than he did before without proportionably depressing others in the same class" (p. 79). The poor laws tend to increase population without increasing the food, and they decrease the share of the industrious poor for the benefit of the pauper (pp. 83, 84). They diminish both the power and the will to save among the common people (p. 87). It is good for society that dependent poverty should be held disgraceful (p. 85). The very possibility of falling back upon parish relief removes a strong motive for providence and for avoidance of the ale-house (pp. 88, 89). In order to give an assistance to some which is a doubtful blessing to them, we subject the whole of our people to "a set of grating, inconvenient, and tyrannical laws totally inconsistent with the genuine spirit of the constitution" (p. 92) namely, the laws of settlement. It is not good to "force population" as Pitt's bill of 1796 seemed to do. There is no real gain to the public from the resulting low wages (p. 134, cp. p. 94).

Such was the strain of reasoning in the first essay; and it recurs in the later writings. The tract on the high price of provisions (1800) contends that the high price is mainly due not to over-issues of the country banks but to the attempt of the poor-law authorities to increase the allowances in aid of wages, so as to overtake the price of corn,—an attempt which caused the poor to compete with the rich in raising the price still further. The dealers were not at fault; by keeping their supplies till prices were highest they furnished supplies when they were most needful; and, after all, the high price has been a real benefit conferred on us for once by the poor laws. So many more of our fellow-citizens have been made by it to feel the effects of the scarcity and economise, that the stock of food has gone farther than it would otherwise have done, the farmers have been encouraged to add to the supply by extended cultivation, and the merchants by importation (*High Price*, pp. 19, 20). That at such a time, too, it would be impossible to leave the poor simply to shift for themselves, he does not expressly concede till the 3rd ed. of his essay (1806, vol. ii. p. 169). Otherwise the tract of 1800 may be said to have been incorporated in the essay without change. The remarks on the part played by the issues of the country banks are expanded. Coming first as an effect of the rising prices, the issues became in their turn a cause of them (see 2nd ed. pp. 402-403; 7th, p. 299; *High Price*, pp. 23-24).

In the 2nd ed. (1803) of the essay, and all the later ones, the poor laws take a much larger place than before. More stress is laid on the impossibility of their requirements. He had said (1st ed. pp. 98, 99): "We tell the common people that, if they will submit to a code of tyrannical regulations, they shall never be in want. They do submit to these regulations. They perform their part of the contract; but we do not, nay cannot, perform ours; and thus the poor sacrifice the valuable blessing of liberty and receive nothing that can be called an equivalent in return." In the 2nd ed. (bk. iii. ch. vi.), he shows this in detail of the promise to find work, quoting DEFOE and EDEN. He quotes HANWAY and HOWLETT to show the great mortality of parish children, whose protection (be it remembered) was the object of the first FACTORY ACT (1802), and concludes "that the poor laws have destroyed many more lives than they have preserved" (p. 416). Moreover, though marriage is encouraged by the poor laws, it is hindered by the deficiency of cottages and the reluctance of the landholders to build new ones (bk. iii. ch. vi. 3rd ed. vol. ii. p. 182).

The proposal of Malthus for the abolition of the poor laws has been already mentioned. He would rely on private charity, and he sees (2nd ed. p. 540) that "the only difficulty would be to restrain the hand of benevolence from assisting those in distress in so liberal a manner as to encourage indolence and want of foresight in others" (*ib.*). He is stern in allowing the sins of the parents to be visited on the children (p. 543). The parish support of deserted children multiplies the desertions (p. 541). What we ought to encourage is family affection and the self-reliance and responsibility of the head of the family. To force a man to marry, however, as is done by some parishes after a case of seduction, is to add evil to evil (p. 542).

If the poor laws were removed, the English people would show, even more strongly than before, their "spirit of industry and foresight." Without the general prevalence of the "strong desire of bettering their own condition" the poor laws would have ruined them in time past (pp. 545-546). But Malthus recognised that abolition must be gradual. "I should be sorry to see any legislative regulation founded on the plan I have proposed till the higher and middle classes of society were generally convinced of its necessity, and till the poor themselves could be made to understand that they had purchased their right to a provision by law, by too great and extensive a sacrifice of their liberty and happiness" (*Letter to Whitbread*, 1807, pp. 6, 7). One valuable preparation would be popular education, especially if it included among its subjects political economy (*Essay*, bk. iv. ch. ix.). Malthus is at all times unwilling "to push general principles too far" (2nd ed. p. 418), and he is patriotic and statesmanlike. Though he sent nothing to the press that is not connected either with political economy or with his college, he was a man of wide reading, varied tastes, and not simply a man of one idea. He was genial and hospitable, and made no private enemies. Sydney Smith, Harriet Martineau, and Mackintosh are loud in his praise. Thomas Love Peacock who satirises his views in *Melincourt* (1818) treats "Mr. Fax" with a good-nature and respect entirely withheld from M'Culloch ("MacQuedy") in *Crotchet Castle* (1831).

The popular notion of his person was for a long time even more inaccurate than of his writings. "No economist of the first rank has been so utterly misrepresented" (Prof. Nicholson, *Pol. Econ.*, i. p. 175, 1893). He was not without honour, however, in his lifetime. He was Fellow of the Royal Society, and of the Royal Society of Literature, a foreign member of the Institut, and of the Berlin Academy of Sciences. He helped to found the Political Economy Club and the Statistical Society. His book on *Population* was translated into nearly all European languages, and has probably received more refutations than any other economical work whatsoever.

The Crisis, 1797 (not published).—*Essay on Population* (see above), 1798, 8vo (anonymous).—*An Investigation of the Cause of the Present High Price of Provisions*, 1800, 8vo (anonymous).—*An Essay on the Principle of Population, or a View of its Past and Present Effects on Human Happiness, with an Inquiry into our Prospects respecting the Future Removal or Mitigation of the Evils which it occasions*, by T. R. Malthus, 4to, 1803.—The same, 3rd ed. in 2 vols. 8vo, 1806, including an appendix with replies to critics. The appendix was also printed separately in 4to, 1806.—*A Letter to Samuel Whitbread, Esq., M.P., on his proposed Bill for the Amendment of the Poor Laws*, 8vo, 1807 (March),—*Essay on Population*, 4th ed. in 2 vols. 8vo, 1807 (same as 3rd).—Review of Newenham's Inquiry into the Population of Ireland, *Edinburgh Review*, July 1808, and probably the 1st part of a similar review of same author, April 1809.—Review of Mushet, Blake, Huskisson, Ricardo, Bosanquet, on the Depreciation of paper currency, *Edinburgh Review*, February 1811.—*Letter to Lord Grenville on the East India Co.'s Establishment for the Education of their Civil Servants*, 1813.—*Observations on the Effects of the Corn Laws and of a Rise or Fall in the Price of Corn on the Agriculture and General Wealth of the Country*, 1814 (3rd ed. 1815).—*An Inquiry into the Nature and Progress of Rent and the Principles by which it is regulated* (February), 1815.—*The Grounds of an Opinion on the Policy of Restricting the Importation of Foreign Corn, intended as an Appendix to Observations on the Corn Laws* (February), 1815.—*Statements respecting the East India College, with an Appeal to Facts in Refutation of the Charges lately brought against it in the Court of Proprietors* (January), 1817, a reply to Joseph Hume and Randle Jackson; a skilful defence of Haileybury College.—*Essay on Population*, 5th ed. in 3 vols. 8vo (January), 1817, the additions being also, as before, printed separately, under the title "Additions to the 4th and former editions of an *Essay on the Principle of Population*," 1817 (preface dated 7th June).—*Principles of Political Economy considered with a view to their Practical Application* (April), 1820 (Preface dated 1st December 1819.—Review of Godwin's Inquiry concerning the Power of Increase in the numbers of Mankind, *Edinburgh Review*, July 1821 (authorship not certain).—*The Measure of Value stated and illustrated with an Application of it to the Alterations in the Value of the English Currency since 1790* (April), 1823.—Review of Thomas Tooke's Thoughts and Details on the High and Low Prices of the Last Thirty Years, *Quarterly Review*, April 1823.—Review of the Essay (by M'Culloch) on Political Economy in the Supplement to the 4th, 5th, and 6th editions of the *Encyclopædia Britannica*, *Quarterly Review*, January 1824.—Article on Population in above, Supplement, 1824.—Paper contributed to the *Transactions of the Royal Society of Literature:* "On the Measure of the Conditions necessary to the Supply of Commodities" (4th May), 1825.—*Essay on Population*, 6th ed.

2 vols. 8vo, 1826 ("Advertisement" dated 2nd January), the last ed. published in the author's lifetime.—Evidence before Select Committee of House of Commons on Emigration, *Third Report*, pp. 311-327 (5th May), 1827.—*Definitions in Political Economy preceded by an Inquiry into the rules which ought to guide Political Economists in the Definition and Use of their Terms, with Remarks on the Deviation from these rules in their writings*, post 8vo, 1827. (A criticism of Adam Smith, J. B. Say, Ricardo, James Mill, M'Culloch, and Samuel Bailey). The later ed. by Cazenove is garbled.—Paper contributed to the *Trans. of the Roy. Soc. of Literature*: "On the Meaning which is most usually and most correctly attached to the term Value of Commodities" (7th Nov.), 1827.—*Letters to Professor W. N. Senior on the Subject of his Lectures on Population* (letters dated 23rd and 31st March), printed with said lectures 1829.—*A Summary View of the Principle of Population*, containing the gist of article on "Population" in Supp. to *Ency. Brit.*, 1830.—*Principles of Political Economy considered with a view to their Practical Application*, 2nd ed. with considerable adds. from author's own MS., and original memoir (by Otter, Bishop of Chichester), 1836.—There may still be in existence—(1) The Crisis; (2) The letters to Ricardo corresponding to the series mentioned below;[1] (3) Notes of his lectures at Haileybury. He had thoughts of converting one course at least (on Adam Smith) into a book (see Ricardo's *Letters*, p. 56). One set of student's notes (taken *c.* 1830) exists, but adds little to our knowledge of Malthus. A 7th ed. of the *Essay* was published by Reeves and Turner (1872), and a new ed. with biography, etc., Ward and Lock, 1890, ed. G. T. Bettany. Parallel chapters from 1st and 2nd eds. of the *Essay* are given in Macmillan's Economic Classics (ed. Prof. W. J. Ashley), *Malthus*, 1895.

[A good portrait is given with the art. Malthus in *Dict. de l'Écon. MALTHUSIANISM. See MALTHUS.

MALYNES, GERARD DE (early 17th century), merchant, was born at Antwerp of English parentage. About 1586 he was a commissioner of trade in the low countries. He came to London and was frequently consulted on commercial questions by the privy council in the reigns of Elizabeth and James I. He was an assay master at the mint. With William Cockayne he obtained a patent to supply farthings, April 1613, but in a petition addressed from the Fleet prison, complained six years later that he had been ruined by being paid in his own coins. Among his projects was one for a system of state pawnbroking. He was called upon by the standing commission on trade for evidence on the state of the coinage, and published the following pamphlets in course of a controversy with Ed. MISSELDEN (*q.v.*).

The Maintenance of Free Trade according to the essential parts of traffique, namely, commodities, moneys, and exchange of moneys by bills of exchanges for other countries, or an answer to a Treatise of Free Trade, or the meanes to make trade flourish, lately published [by Ed. Misselden], London, 1622, 12mo.—Commodities are the body, money the soul, and exchange the faculty of the soul. "All the causes of the decay of trade are almost all of them comprised in one, which is the want of money" (p. 104).—*The Centre of the Circle of Commerce: Or a Refutation of a Treatise entitled the Circle of Commerce or the Balance of Trade*, also directed against Misselden, appeared in 1623, 4to. His chief point is that his opponent did not consider the "predominant part of trade," "viz. the mistery of exchanges," "showing his maine scope to be, to have the moneys of the realme inhaunced, and the foreine coyne to be currant at an equall value."

By far the most remarkable work of Malynes was—*A Treatise of the Canker of England's Commonwealth, divided into three parts; wherein the author, imitating the rule of good phisitions, first, declareth the disease; secondarily, sheweth the efficient cause thereof; lastly, a remedy for the same*, Lond., 1601, 16mo. In this publication Malynes argues that the disease is the decrease of our wealth by (1) transportation of money or bullion; (2) selling our home commodities too cheap; (3) buying foreign commodities too

[1] One, and only one of the series has been found in the M'Culloch collection, Brit. Mus., and published by Dr. Hollander. It is dated 11th August 1823.

dear. All this results in the overbalancing of our exports by our imports; and the cause of this overbalance Malynes shows to be the abuse of the money exchange between England and other countries. He insists that "gain is the cause of exportation of our monies," as the result of which home prices fall and foreign prices rise. After giving a description of the foreign exchanges, the author proposes as remedy: (1) the exchange for all places to be kept at a certain price; (2) higher customs to be placed on imports and paid by the foreigner; (3) the transport of bullion to be prohibited. His leading idea was that public authority alone could fix the terms of exchange and even the value of money, quite irrespective of the cost of the precious metals. He strongly urged the bullionist policy.

Saint George for England, Allegorically Described (R. Field, Lond., 1601, 8vo), is an account of the social evils in the state. "This dragon," Malynes says, in his preface to the reader, "is 'fœnus politicum,' his two wings are 'usura palliata' and 'usura explicata,' and 'his taile unconstant cambium.' The virgin is the king's treasure. The champion S. George is the king's authority."

He also published *England's View in the Unmasking of two Paradoxes* (by De Malestroict); *with a replication unto the answer of Maister J. Bodine* (Lond., 1603, 12mo).—*Lex Mercatoria*, a compendious collection containing the sea laws of Edward III., the Hanse sea laws, and certain books treating of merchants' accounts and the law merchant (Lond., 1622, fol.; 1629, fol.; 1636-51, fol.; 1653, 1655, 1656, 1660, fol.; 1686, fol.).—*The Commonwealth of Bees, represented by Mr. G. Malynes by way of a digression in his great book called Lex Mercatoria*, 1655, 4to.

[See ENGLISH EARLY ECONOMIC HISTORY).—*Dict. of Nat. Biogr.*, vol. xxxvi., pp. 9-11.]

MANAGEMENT, PAYMENT FOR. See EARNINGS OF MANAGEMENT.

MANCHESTER SCHOOL, THE. The group of ideas comprehended in the term "Manchester school" has for its centre and source the doctrine of free trade derived from Adam SMITH. The illustrious Scotchman, indeed, declared that to expect that the doctrine would ever become a practice in the United Kingdom was as absurd as to expect the establishment of a Utopia. The principal ground of his scepticism was the political power of the protected interests—of manufacturers chiefly, who, he said, were formidable to the government, and who, upon occasion, were accustomed to overawe the legislature. The course of events has shown that, in England at all events, the power of the monopolists has not been so insurmountable an obstacle to the progress of free trade as Adam Smith anticipated. This fact is traceable to the influence of the Manchester school. The *Wealth of Nations* was published in 1776, and its teachings were apparently unheeded for many years. But the leaven was silently working, and before the end of the century it had taken possession of the mind of Mr. Pitt, whose policy during his prime ministry, from 1783 to 1801, was visibly influenced by the book, which he read diligently. To it may be ascribed, with some confidence, the portion of the Act of Union with Ireland (1800) providing for the abolition in 1820 of all customs duties between Great Britain and Ireland. In the latter year the policy of free trade was for the first time boldly advocated, as the basis of a comprehensive fiscal reform, in the famous petition to parliament of the merchants of London, drawn by Thomas Tooke (see MERCHANTS' PETITION). This was almost immediately followed by a similar petition from the chamber of commerce of Edinburgh. The presentation of these documents led to the appointment of a select committee of the House of Commons, and its report, published on 18th June 1820, was in harmony with the argument and prayer of the petitions. The investigations and conclusions of the committee were not entirely abortive, for they were the cause of the tariff reforms initiated in 1825 by HUSKISSON, who, with Mr. Gladstone, the father of the Right Hon. W. E. Gladstone, had shared in its labours. Meanwhile one retrograde step had been taken. In 1819 the provision for the complete liberation of trade between Great Britain and Ireland was abandoned by an act extending the then existing customs arrangements for a further period of twenty years, but reducing the duties by one-fourth at the end of every five years.

In 1820 the Manchester chamber of commerce was founded, or rather reconstituted, for it had previously existed under the title of the Commercial Society, established in 1794, the minutes of which are still preserved. One of the first acts of the new body was to protest against this backward step "as an infraction of the act of union, and an unnecessary continuance of restrictions highly injurious to both countries." The protest, which was put forward by deputation to government and by petition to parliament, was, after some delay, successful. Thenceforward opinions in favour of the abandonment of protection gained a permanent hold upon the minds of leading merchants and manufacturers in Manchester, and found expression almost every year at the chamber of commerce. In particular, import duties on foreign grain were the subject of strong condemnation, on the ground that they raised the cost of food and restricted trade with foreign countries. Towards the close of 1838 the agitation culminated in a broad and emphatic denunciation by the chamber of the policy of protection, Richard COBDEN taking the leading part in this act. Immediately afterwards the ANTI-CORN LAW LEAGUE (*q.v.*) was founded, and it was not dissolved until its

object was accomplished in 1846. The vigour and the variety of resource and method by which the work of the League was carried on, as well as the educational effect of its constant demonstration of the soundness of the principle of free trade, gained for the League world-wide attention. Thenceforward the doctrine of free trade became associated with the birthplace and home of the body which had made it a living force in national politics.

The name "Manchester school" did not originate with the League. It was bestowed from without, and has had an extensive recognition in Germany, where it has acquired a meaning wider than the speeches and writings of its exponents warrant, although undoubtedly the main ground upon which the policy of free trade was advocated impelled them to take up a distinct position on other questions besides that which was the main object of their efforts. LAISSEZ-FAIRE was in general their guiding maxim, but not without regard to other controlling principles. Among these separate questions the most prominent were war, colonial policy, and factory legislation.

From the idea of free interchange of the products of industry to that of international peace, the transition of thought is natural and obvious. When therefore the leaders of the Manchester school had secured legislative acceptance of the principle of free trade, they turned their attention to other obstacles to its progress. One of these they found in international jealousies and mistrust, which they ascribed partly to mutual ignorance, and partly to the practice of maintaining large armaments. These, they said, produced two evils. They laid heavy burdens on industry in the shape of excessive taxation, and they discouraged trade by preventing the growth of commercial confidence, and by furnishing an excuse for upholding the system of protection abroad. Peace, non-intervention in foreign political affairs, and reduction of warlike expenditure were consequently among their watchwords. But Cobden did not seek these objects merely because he thought they would promote material prosperity. Peace was rather the end, and free trade the road to it. Speaking on one occasion in 1850, he said, "Do not suppose that I advocated free trade merely because it would give us a little more occupation in this or that pursuit. No; I believed free trade would have the tendency to unite mankind in the bonds of peace, and it was that more than any economic consideration which actuated me in the struggle for free trade." Their earnest advocacy of peace and non-intervention when speaking on questions of public policy, and their undisguised sympathy with the peace society, led to the misconception, somewhat widely entertained, that Richard COBDEN and John BRIGHT, the chief apostles of the Manchester school, were in favour of "peace at any price." Both of them, however, took pains to repudiate the doctrine of non-resistance—Cobden frequently, and Bright on at least one occasion. At Wrexham, in October 1858, Cobden said, "I have not, as you have observed, pleaded that this country should remain without adequate and scientific means of defence. I acknowledge it to be the duty of your statesmen, acting upon the known opinions and principles of ninety-nine of every hundred persons in the country, at all times, with all possible moderation, but with all possible efficiency, to take steps which shall preserve order within and on the confines of your kingdom."

It was a part of the teaching of the Manchester school, that the relations between the colonies and the mother country should be radically altered. Its exponents contended that the heavy charge then imposed upon the home treasury as a contribution towards the expenses of administration and defence of the colonies should be abolished, and that the preferential treatment at British custom houses of certain colonial productions should be discontinued. Both these changes have long since been made, but the advocacy of them fifty years ago formed the basis of a charge that the Manchester school desired to sever the political connection of the country with the colonies. This charge also was explicitly denied. Mr. Cobden declared in 1849, in answer to it, that he wished to retain them, "not by the sword, but by their affections," and in justification of his objection to the maintenance of forces there at the expense of the British exchequer, he affirmed that the colonists were more lightly taxed than the home population, and were well able to bear the cost of their own defence.

The attitude of the school towards factory legislation cannot be described as in all respects friendly. Of the practice of forbidding by law the employment in labour of the young its exponents usually approved, but they were, as a rule, opposed to all interference with the liberty of grown persons (see FACTORY ACTS). In 1836 Mr. Cobden wrote, for the information of the electors of Stockport, respecting the protection of young persons from excessive labour, "I will not argue the matter for a moment with political economy. It is a question for the medical and not the economical profession. . . . Nor does it require the aid of science to inform us that the tender germ of childhood is unfitted for that period of labour which even persons of mature age shrink from as excessive. In my opinion—and I hope to see the day when such a feeling is universal—no child ought to be put to work in a cotton mill at all so early as at the age of thirteen years; and after that the hours should be moderate, and the labour light, until such time as the human frame is rendered by nature capable of enduring the fatigues of adult labour. Had I been in the House of Commons during the last session of Parliament, I should have opposed with all my might Mr. Poulett Thomson's measure for postponing the operation of the clause for restricting the hours of infant labour." The point of these observations, so far as they bear upon the general question of factory legislation, is that the man who may be regarded as, before all others, the exponent of the doctrines of the Manchester school, here emphatically declares that economic considerations are subordinate where considerations of humanity are in conflict with them. *Laisser faire* was therefore not an invariable tenet of the school.

The educational work of the Anti-Corn Law League, its struggles and its triumph, made a deep impression upon the minds of economists and statesmen in foreign countries, especially in Germany, France, and Italy. When, therefore, in 1846 and 1847, Mr. Cobden visited several of the European capitals, he was received as the hero of a beneficent revolution, and the principles of the Manchester school were proclaimed as a kind of gospel. Hardly any practical result in the shape of legislation abroad was realised, but the opinions and the hopes of economic thinkers with regard to the prospects of free trade, especially of those who had already been influenced by the teachings of the PHYSIOCRATS and of Adam Smith, were greatly strengthened. But the influence of the Manchester school has not remained extensive, except perhaps in Holland (see DUTCH SCHOOL). It is still strong amongst a comparatively small number of able writers and statesmen in France, who, however, have little force in practical politics. In Germany it has been largely extinguished by the teachings of the historical and socialist schools. At the hands of their exponents it has received severe and sometimes ill-founded criticism. Schönberg has attributed to the Manchester school, as its fundamental base, the doctrine that selfishness is the most energetic and the sole legitimate economic motive, and that its free expansion can alone establish the best economic condition. There can be no doubt that individualism, with a minimum of restraint, was constantly proclaimed or implied in the speeches and writings of Cobden and Bright. It must be remembered, however, that they were confronted by an actual condition in which a long course of interference with individual freedom of commerce and industry had produced formidable evils which naturally evoked reaction in observant and energetic minds.

A survey of the work of the Manchester school presents two prominent facts of essential importance. The first is that its leaders made no attempt to write systematic treatises of economics, nor even to expound methodically a particular set of economic ideas. They were men of action rather than students, although they were both. Thoroughly imbued with the teachings of Adam Smith, they saw in the legislation, and in the ruling economic maxims of their time, a state of things extensively opposed to the principles of their master. And fortune had given them a practical as well as a theoretical interest in labouring to make these principles a living and successful force in politics. The second fact is that their sphere of employment was not the study nor the lecture-room, but the popular platform, the floor of Parliament, the newspaper, and the pamphlet. Denunciation of their opponents, appeals to sectional interests, and various other weapons of popular controversy, as well as connected argument and methodical reasoning, were frequently brought into their service. The task they had undertaken was not only to convert a nation but to overthrow powerful interests whose supremacy seemed to Adam Smith invincible. Vehemence and passion were therefore not seldom displayed, with the inevitable result that the motives of their opponents were sometimes unjustly represented, and occasionally what was simply ignorance in high places was described as a kind of malevolence. These faults were perhaps inseparable from an enterprise eminently one of political warfare, quickened by the sight of widespread suffering, due largely to bad laws. They have also, however, inevitably perhaps given ground for unfavourable judgments upon the Manchester school, and for some misapprehension as to its doctrines and aims. In the light of history, however, the results of its labours are allowed to be in the highest degree beneficent, and the published speeches and writings of Cobden and Bright may fairly take rank as classical. For apart from what is of historical or temporary interest, they deal with principles of abiding importance. Moreover, the "unadorned eloquence" and homely persuasiveness of Cobden's utterances, not less than the surpassing beauty frequently found in those of Bright, give them a permanent value.

Much of their work and of their teaching has stood the test of time, even if further progress has not been made. Free trade holds still, theoretically and practically, an unassailable position in the United Kingdom. Elsewhere it has gained little ground, mainly because no means have yet been found in protectionist countries of overcoming those dominant interests which induced Adam Smith to despair of the triumph of free trade even in England. Non-interference in foreign affairs, and the avoidance of entangling political alliances have, to a large extent, been accepted as the basis of foreign policy. The financial independence of the colonies has become a fact. On the other hand, warlike expenditure and the cost of government have increased enormously at home and abroad. The functions of government too have grown at the expense of individualism. In these respects the march of events has gone mainly in opposition to the doctrines of the Manchester school. Its exponents were indeed strongly in favour of the maintenance and spread of popular instruction under the control of public authority, and of the extension of local administration. They would, however, have opposed much of that interference with trading operations, of which the Merchandise Marks Act is a type. The school is gone, although its work remains. But both its work and much of its teaching have taken a firm hold of the organisation and the mind of the British nation. See A. J. Balfour's Essay on Cobden and the Manchester School, published in *Essays and Addresses*, Edinburgh, 1893.

E. H.

MANCINI, Celso (died 1612), a philosopher and politician, was born in Ravenna, the exact date not known. He taught moral philosophy at the university of Ferrara, and was made a bishop by Clement VIII. His principal work is *De Juribus principatum*, Libri novem, Romæ, 1596. The fifth book contains economic and financial matter of considerable merit. Mancini displays sound ideas on exchange and the theory of money. He distinguishes between the two duties of the state in reference to money, the care required for its maintenance, and the determination of its value, which both must correspond to the relations of the market. Mancini maintains the exclusive right of a prince to coin money—but he denies his right to debase it. Agreeing in this with other political writers of his day, Mancini regards it as the duty of a prince to maintain abundance in his dominions, exercising a paternal influence over them. The most important part of the fifth book is on finance, especially taxation. He enumerates the different taxes adopted in his day and proposes a rational classification of them, establishing the fundamental rules of finance, as the relation between taxes and the amount of public expenditure, and the proportion they should bear to the wealth of the citizens. Mancini's arguments throw considerable light on the subject of taxes, and indicate the first outlines of a doctrine which was developed much later; he also discusses tithes.

[See Gobbi, *L'economia politica in Italia negli scrittori italiani del secolo XVI-XVII*, Milan, 1889.—Supino, *La scienza economica in Italia nei secoli XVI-XVII*, Turin, 1888.—Rava, *Celso Mancini, filosofo e politico del secolo, XVI*, Bologna, 1888.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, Modena, 1893.—Ricca-Salerno, *Storia delle dottrine finanziarie in Italia*, Rome, 1880.] U. R.

MANCIPATIO, according to Gaius (I. 119, Poste's translation), is an imaginary sale which is only within the competence of Roman citizens, and consists in the following process:—In the presence of not fewer than five witnesses, citizens of Rome above the age of puberty, and another person of the same condition who holds a bronze balance in his hands and is called the balance-holder, the alienee, holding a bronze ingot in his hands, pronounces the following words: "This man I claim as belonging to me by right quiritary, and be he (or, he is) purchased to me by this ingot and this scale of bronze." He then strikes the scale with the ingot, which he delivers to the transferor by way of purchase money. Gaius adds (I. 122), "The reason of using a bronze ingot and a weighing scale is the fact that bronze was the only metal used in the ancient currency, which consisted of pieces called the as, the double as, the half as, the quarter as; and that gold and silver were not used as media of exchange, as appears by the law of the Twelve Tables; and the value of the pieces was not measured by number but by weight."

In early Roman law *mancipatio* was an actual sale of property; but in course of time it became merely a form of transfer, the money (*æs, rauduscŭlum*) paid to the transferor by the transferee being a merely fictitious payment. When conveyance by delivery was established, *mancipation*, or cession in court, was still necessary for transferring legal ownership in *res mancipi—i.e.* land in Italy, rural servitudes, slaves, fourfooted beasts of draught and burden. "The list of *res mancipi* thus comprises the principal appendages, movable and immovable, of an old Italian farm" (Sohm, *Institutes of Roman Law*, trans. by Leddie, p. 230).

Mancipatio was used for the purpose of transferring family rights over persons as well as rights of property. It was also a means of making a will, established by the law of the Twelve Tables. E. A. W.

MANCUS, a denomination used in Anglo-Saxon times and till the 12th century; almost certainly not a coin but only money of account, equivalent to a weight of 675 grains troy of silver, to thirty pennies or six shillings in value.

[Ruding (*Annals of the Coinage of Great Britain*, ed. 1840, pp. 103, 111) thinks that an Italian gold coin of this name may have been imported into England, but used only for a short time. The mancus was reckoned in either silver or gold.—Eccleston, *Introduction to English Antiquities.*] E. G. P.

MANDAT (Fr.). An order or authorisation to pay a sum of money. The term is employed in French administrative departments, the *mandat* being signed by the director, or by the treasury, or the receivers-general of taxes, in which case it is called a *mandat du trésor*.

The Mandat de Change, now obsolete, was an imperfect letter of exchange, which by custom the drawee was not bound to accept, and which was not protested in default of acceptation. There was no special legislation with regard to the *mandat de change* as for letters of exchange, and more recently for the cheque, now substituted for the *mandat*.

Mandat de Poste, a post office order.

Mandats territoriaux were a paper money during the revolutionary period. The Assignat having become valueless in 1795, the material of which they were made was destroyed publicly with some ceremony. The government was shortly again embarrassed for money, and, by a law of the 18th May 1796, ordered the issues of 2,400,000,000 of francs of *mandats territoriaux* secured on national or confiscated property, the sale of which was decreed at twenty times the revenue it produced. The public had, however,

no confidence in this new paper, and on the first day of its issue it lost 82 per cent of its value, 100 francs in mandats being exchanged for 18 francs in coin. In less than a year the mandats had become so much depreciated that they were abolished as a legal tender, although they continued to be received for a short time in payment of arrears of taxes.

MANDAT, a proxy; its effects are described in articles 1984 to 2010 of the civil code. T. L.

MANDATUM, a contract, binding by mere agreement between the parties, whereby one of them, "*mandator*," gives, and the other, "*mandatarius*," undertakes to perform, a commission without any payment being promised for its execution. Each party may revoke the contract at pleasure, but the mandatary is liable, if by so doing he causes loss to the mandator. The mandatary can claim compensation for necessary outlay in the execution of his commission. E. A. W.

MANDEVILLE, BERNARD DE (1670?—1731), satirist, was born in Holland, where he practised as a physician. Of his life, after his settlement in England, little is known. After producing several works of an ephemeral character, Mandeville became suddenly famous as the author of the *Fable of the Bees, or Private Vices Publick Benefits*. The poem had been published as early as 1705, under the title of the *Grumbling Hive*, in a sixpenny pamphlet, and had apparently not attracted much notice. In 1714, it appeared, 12mo, under its new title with numerous notes. A second edition followed in 1715, with additional notes, and an essay on "Charity and Charity Schools." Mandeville may be right in his surmise that the powerful interests attacked in the latter essay may have drawn attention to the *Fable*. In any case, the 1723 edition was presented as a nuisance by the grand jury of Middlesex, and the work denounced by writer after writer. New editions followed in quick succession, until in 1806 it had reached its eleventh. The vogue appears, henceforth, to have waned, and the *Fable of the Bees* is now more often alluded to than read. The merits of Mandeville lie rather in a style often singularly powerful for the pen of a foreigner, in poignant hints, scattered in the byways of the book, *e.g.* the passage in which he anticipates the modern view that hospitals should be as much schools of medicine as places of cure, and in his remorseless exposure of the seamy side of human nature rather than in his central paradox. So far from private vices being, in themselves, or, "by the dextrous management of a skilful politician," public virtues, it can be clearly demonstrated that every private vice involves a direct public waste to the community. In discussing the subject, Dr. Johnson quoted the words of Sir Thomas Browne, "Do devils lie? No, or hell would not subsist." Vice is, in its essence, anti-social, and on this "the truth, the whole truth, and nothing but the truth" is contained in Plato's *Republic*. The most reasonable statement of the case is contained in a passage, wherein Mandeville says, "Those who can enlarge their views . . . may in a hundred places see good spring up, and pullulate from evil as naturally as chickens do from eggs"; but the evil which is inchoate good is different from vice. Mandeville's imposing structure of moral paradox rests for its basis on an economic fallacy. The proposition, that private vices are public benefits, is the ethical equivalent to the economic delusions that spending, of necessity, benefits the community, and saving injures it; that luxury, as a matter of course, is good for trade, that it is "prudent to relieve the wants of the poor, but folly to cure them"; that "ignorance is a necessary ingredient in the mixture of society"; that the aim of the legislature should be to keep labour cheap; and, lastly, that the yearly imports should never exceed the exports. Experience, no less than theory, has abundantly shown the falseness of all these notions. It must be remembered that Mandeville lived before the growth of the modern industrial system (see INDUSTRIAL RÉGIME). A society wherein the steady demand of the working classes themselves should afford the best custom to manufactures; wherein the capricious and fluctuating requirements of luxury could be regarded as an evil, however inevitable: wherein trade pre-eminence should largely depend upon the technical education of the workers, and high wages by no means of necessity spell low profits; wherein the main of imports should be to supply the raw produce of manufacture, and to feed the producers at the cheapest rate, —such a society was not dreamt of in Mandeville's philosophy.

In the essay on "a search into the nature of society," added in the 1723 edition, Mandeville contends with much force that it is the power of the evils which surround them which drives men to be sociable. In a second part to the *Fable*, published in 1728, 2nd ed. London, 1733, 8vo, he endeavours, in six dialogues, to show up the real character of human virtue and the meanness of the motives of which it is the outcome. *An Inquiry into the origin of Honour*, 8vo, appeared in 1732.

[*Dictionary of National Biography*, vol. xxxvi., article by Mr. Leslie Stephen contains the few facts known as to his life.

The more notable of Mandeville's critics were—Bishop Berkeley, in *Alciphron*, dialogue 2, wherein Lysicles is Mandeville, 2nd vol. of *The works of George Berkeley*, 4 vols., London, 1871, 8vo.—Adam Smith, *Theory of Moral Sentiments*, pt. vii. § 2, an unfavourable opinion both from the economic and ethical points of view.—W. Law, whose *Remarks, etc.* were republished in 1844, with a characteristic introduction by F. D.

Maurice. — Hutcheson, *Inquiry into the original of our ideas of Beauty and Morals*, 1726. See also Leslie Stephen, *English Thought in the 18th Century*, 1876, 2 vols., 8vo, ch. ix. § 34-44 and ff. "Mandeville, by attempting to resolve all virtue into selfishness, stimulated the efforts towards a scientific explanation of the phenomena." H. E. E.

MANGOLDT, Hans Karl Emil von (1824-1868), was born at Dresden and studied law and political science at Leipzig, Geneva, and Tübingen. In 1848 he was employed by the Saxon minister of foreign affairs; and the department of the interior entrusted to him, in the same year, the preparation of a history of the industries of that state. But in June 1850 a reactionary *coup d'état* was carried out by the government of Von Beust, and Mangoldt sent in his resignation, stating his reasons for the step. He not only thus lost his official position, but in consequence of the act was often afterwards pursued by the enmity of the minister. Having further studied economics at Leipzig, he undertook in 1852 the editing of the *Weimar Gazette*, which however he soon resigned, again on the ground of political convictions. In 1855, by the publication of his principal work, *Lehre von Unternehmergewinn*, he established his scientific reputation, and in 1858 became extraordinary professor of political economy in the university of Göttingen, in which capacity he visited the London Industrial Exhibition of 1862 at the cost of the Hanoverian government. He was appointed in the same year to the chair of political and cameral sciences at Freiburg; and, after a visit to the Paris exposition of 1867, he fell into ill health and died at Wiesbaden.

In 1863 Mangoldt published *Grundriss der Volkswirthschaftslehre*, which Cossa thinks one of the best existing compendiums of the science; a 2nd ed. appeared in 1871. In 1868, he began in the *Bibliothek der gesammten Handelswissenschaften* a treatise on political economy, which he did not live to finish. He also contributed a number of articles to Bluntschli and Brater's *Staatswörterbuch*, amongst which are estimates of Colbert, Carey, Bastiat, and Mill.

Mangoldt's special importance in the history of economics is due to his having been the first, with a partial exception in favour of Hufeland, to submit what is now called "the earnings of management" to a thorough investigation. He was, in essentials, a follower of Adam Smith, but, says Adolf Wagner, "kept himself free from the one-sided views of the radical Manchester school" which exaggerated or perverted the doctrines of the great Scotsman. Roscher describes him as a somewhat dry writer, but possessing a sagacious and penetrating intellect; he particularly admires his definition of the science of economics as "the philosophy of the history of (practical) economy," and approves his saying that an economic fact is not scientifically explained till the inductive and deductive explanations of it coincide.

J. K. I.

MANIFEST is the British term for one of the most important of a ship's papers, which sets forth (manifests) the particulars of the cargo. To the customs department, especially where most articles are dutiable, as in many British colonies, it is an essential document; all ships making an entry in such ports are required to furnish a duplicate of the manifest, and by it the duties are checked. C. A. H.

MANLEY, Thomas, was one of a number of 17th-century agitators for the better regulation of English trade and commerce. He was anxious for a strictly protective foreign policy, and in 1677 published his *Discourse*, showing that the export of wool is destructive to this country. He advocated the prohibition of unprofitable imports, such as foreign wines, "brandies and baubles," and actually proposed the revival of the ancient sumptuary laws—with a view to encourage the English woollen manufacture which, in the face of foreign competition, was obviously declining.

Manley fell into the error of wishing to promote the interests of the manufacturers at the consumers' expense.

In 1669 Manley published his *Usury at 6 per Cent Examined*, in which he opposed the liberal theories of Sir Thomas Culpeper, and J. C. (Sir Josiah Child), who had advocated the cheapening of money. Manley was anxious to keep up a high rate of interest, from a fallacious notion that it was advantageous to trade.

Manley's works are: *A Discourse shewing that the export of wool is destructive to this kingdom, wherein is also shewed the absolute necessity of promoting our woollen manufacture, and moderating the importation of some commodities and prohibiting others, with some easie expedients tending thereunto.* Licensed 8th March 1676, London, printed, 1677.—*Usury at 6 per cent examined and found unjustly charged by Sir Thos. Culpeper and J. C., with many crimes and oppressions whereof 'tis altogether innocent. Wherein is shewed the necessity of retrenching our luxury and vain consumption of foreign commodities imported by English money; also the reducing the wages of servants, labourers, and workmen of all sorts, which raiseth the value of our manufactures* 15 *and* 20 *per cent dearer than our neighbours do afford them by reason of their cheap wages; wherein is likewise hinted some of the many mischiefs that will ensue upon retrenching usury; humbly presented to the High Court of Parliament now sitting*, London, 1669. A. L.

MANOR, The (Historical). The starting-point in the economic history of the early and middle ages is the manor, and in consequence, a knowledge of the character and transformation of its constituent parts is essential to an understanding of the progress of agrarian and industrial life. In origin the manor is

probably connected with the tribe. Although scholars are not agreed as to the stages of manorial development, yet the tendency of current investigation is to associate it with certain economic processes which accompanied the transition from tribal to territorial life. Those who are unwilling to give up entirely the older views of Von Maurer, Kemble, and Maine see between the tribal and the manorial stages a distinct transitional form distinguished from the tribe by its territorial basis, from the manor by the freedom of its members, and from both by the extent of its self-government (Vinogradoff in *English Historical Review*, July 1893, p. 542). Others, more radical in their rejection of the old theory, deny the existence of such a stage, and connect the manorial directly with the tribal stage by an unbroken chain of rank, wealth, serfdom, and private property.

When historical information begins, the landed estate is found to exist with many of the features of the fully-developed manor. The earliest evidence is, however, inconclusive, owing to its meagreness and to the uncertainty regarding the dates of the first praedial documents, the custumals of Hysseburne and Dyddenham. In Anglo-Saxon times the manorial unit is rather economic than legal, and although the seignorial element was fully developed in that period, nevertheless the fully feudalised estate does not appear even in the *Rectitudines Singularum Personarum*, the chief pre-Norman document. Economic life had become manorialised but not feudalised. There existed, on the one hand, the manor house with its court, and the lord's demesne, under the *gerêfa*, or reeve, at this time the sole officer in control; on the other, the agricultural community with the dependent tenantry, the meadows, pastures, commons, and waste.

The manorial unit was therefore composed of two essential parts, one the seignorial, distinct from the point of view of jurisdiction and taxation; the other the vill or township, a unit in matters of service and labour. Seignorial rights, in part traceable to royal grants, are in greater part the result of causes both tribal and military. The measure of the Roman influence in creating such rights is as yet indeterminate. Although there is no express mention of such rights in the early charters, yet there is reason to believe that the right to hold a court of one's tenants and the right to exact fines arising from the judgment of such court is older than the first express grant of *sake* and *soke* in the charter of Cnut of the year 1020. The powers exercised in such a court were purely civil. Criminal and penal jurisdiction was probably of a later date, and originated in an express grant from the king. The determination of this question regarding seignorial rights is important; for the manorial court represents the close unity between the lord and the vill quite as much as does the open field system, inasmuch as the court was the meeting of the village community with the lord or the gerêfa as the presiding judge. It was a single court exercising police duties and certain criminal functions according to the terms of the charter by which jurisdictional powers were conferred. The second constituent element was the agricultural community, of which the lord was a part as his demesne lay largely in the open fields, and was subject to the rules that regulated the cultivation of those fields. The tenantry were of two classes; first, the *gebûras*, each of whom held in addition to his house and outfit of oxen a yardland normally of thirty acres, scattered in acre and half-acre strips throughout the open fields; secondly, the *cotsetlas*—in origin probably of the 9th or 10th century—each of whom had a cot and five acres of land scattered like those of the gebûras. The cotsetlas rendered no GAFOL—payment in money, produce, and work—and had no outfit of oxen. The *geneâtas*, if a separate class, could not have been numerous, and may have been of the nature of riding-men. Their identity is problematical. The obligations of the tenantry were divided into three groups; the gafol, the regular work upon the demesne, known as WEEK-WORK, and the PRECARIUM or special work in ploughing time and harvest. These services were originally personal, but afterwards became attached to the land. The main interest of the estate was agricultural. Cattle were kept for draught animals, cows for their calves, their beef, and their milk, sheep for their mutton and fleece. Nearly all necessities were supplied by the estate itself. Artisan work, largely that of slaves, was subordinate to the agricultural needs, and furthered mainly the agricultural economy. Yet, with all its isolation, each estate had some communication with the outside world. Surplus produce was sold for money or exchanged for metals and salt. The stage was one of self-sufficing economy, a stage in which the seignorial and the agricultural elements became so firmly bound together as to require the forces of centuries to disintegrate them. Yet the two parts were quite separate, the lord and the manor-court standing above the gafol-payers and exercising authority over them. In this sense the gafol-payers were in a position of dependence, a servile community under the gerêfa, who with the four best men attended the hundred and shire-moots. If such representations be incident to Anglo-Saxon times it witnesses to the legal position of the townsmen as being folk-free. The gebûr and cotsetla were "frigean men," though freedom was purely a relative quantity. In the 13th century, when the place of the reeve and four men in the county and hundred courts can be traced

in the evidence of the extents, it is clear that they were in the majority of cases a VILLEIN. At that time reeveship was a mark of servile status.

In the general organisation of the manor, we find no change in Domesday book. The *villani* are the gebûras, the *cottarii* and *bordarii* the cotsetlas. The amount of land held is practically the same, a virgate to the villein, a portion normally five acres to the cottar. Although the Norman Conquest increased but little the number of manors, yet it rendered them more powerful, by giving them a distinctly feudal character. Its feudalising influence tended to define the social status of the villeins, to place the free and the unfree in a common classification, and to prevent villeinage from lapsing into slavery. The manorial system became more complex, the feudal lord was the centre of many manorial units, each complete in itself, and a duplication of offices thus became necessary. The seneschal, as deputy of the lord, presided at the courts, audited accounts, conducted sworn inquests and extents. The bailiff managed the demesne, and collected rents and dues. But the reeve and bydel still continued to serve in subordinate capacities, and on smaller manors still remained the sole officers in charge under the lord. From the agricultural standpoint, manorial enterprise during this period was still collective rather than individual, and in consequence expansion and change took place very slowly.

But the breaking down of the cumbersome system of labour rents tended to increase the number of social groups upon the manor. In this respect the post-Domesday estate is exceedingly complex. LIBERE TENENTES, including those holding by military and free service, whose earlier existence has been denied because of their omission in Domesday, now appear. Below the freeholders are to be found many groups of those holding by base tenure, arranged in classes, not necessarily exclusive of each other, but indicative of dwelling, status, service, or holding. Of the first class are the villani, of the second the *nativi*, of the third the *consuetudinarii*, *custumarii*, *akermani*, *carucarii*, of the fourth the *hidarii*, *virgatarii*, *ferendelli*, and the more local classes, *landsettagii* in north Norfolk, *tenentes Honilond*, *tenentes Forlonda*, *tenentes Penilond* at Gloucester Abbey, etc. As the result of commutation MOLMEN began to appear who, by paying rent, were freed from work, thus in service, though not in status, approaching the free tenantry. *Gavelmanni* and *censuarii* may represent a line of rent-paying tenants, who, though living in villeinage, had never been bound to labour services. *Lundinarii*, *cotlandarii*, *cotarii*, *coterelli*, as successors of the old cotsetlas, had as a rule no part in the common arable, and were inferior to the villeins, and sometimes served under them.

Judicially there is no reason to believe in an extensive increase of curial functions. It is uncertain what is to be understood by *manerium* in Domesday, and there is little evidence of the smaller jurisdiction of manors in the reign of Henry I.

Three processes were taking place which were to destroy eventually the compactness and unity of the village and manorial group. Such disintegration was the inevitable outcome of the opening of markets, roads, and lines of communication with the continent, the growth of commerce, the political centralisation within the kingdom itself, and above all the increasing dominance of industry over agriculture. Rearrangements in state and society led to rearrangements in the manorial organisation. The first process, commutation, tended to free the individual from bondage to the lord and the land, and to break down an archaic relationship, which has its historical justification in having been an economic necessity in an age of decentralisation. The second, the increase of separate plots, farms, leases, and enclosures, destroyed the open field system, and the old forms of agriculture. The third, the absorption of manorial rights of justice by the royal courts, led to the gradual withdrawal of all real power from the manorial courts. To these may be added the growth of hired labour, the increase of exchange, and the consolidation of holdings, wherein the single acre strips begin to get united into larger strips, while still preserving the open field system.

Commutation began very early. The later system of money rents cannot be said, however, to have grown in every instance out of a system of labour services. It is quite possible to see in such payments an unbroken continuity of rent-paying tenants from Anglo-Saxon times. Money payments were made by the gebûr as a part of his obligation to the lord. In Domesday book the value of works performed is estimated in money, and on post-Domesday manors this became a regular part of the bailiff's accounts. While labour-rents were expressed in money-values for convenience in estimating the profit or loss of the manor, a few of the villeins who formerly did work began to pay money, as in the case of the molmen who still remained technically villeins. An examination of early mediæval evidence would probably show many cases of commutation where manorial conditions made this possible. The 13th and 14th centuries show a steady increase in this transformation; which was inevitable from the pressure of external economic forces. Payments in kind, and in labour service, rapidly gave way to payments in cash. On later manors it would seem that the lord preferred the old custom of labour-rents; and bailiffs' accounts of this period furnish instances of a reckoning in works, while the payment was actually made in money. It

would seem to have taken a long time for commutation to have become an established fact. But the obligations of barons and holders *in capite* to pay scutage (though but two were levied after 1306), aids and hidage, the inconveniences of festivals and the changes of weather, the simplifying of manorial accounts, and the necessity of paying in cash for goods purchased off the estate, made the change unavoidable, even though it was resisted by the manorial lords. Such resistance was in part due to conservatism, in part to the fear of giving bondmen the standing of free men, and in part to the uncertainty of obtaining hired labour. The change was effected earlier on the royal demesne than on the ecclesiastical estates. The emancipation of the bondmen, due to the influence of the royal courts of justice, the winning of privileges by the chartered towns, and the teachings of Protestantism, went steadily on by the side of the commutation movement. It was not, however, until the days of Elizabeth that villeinage began to approach its end. At that time public opinion turned against the institution; the last case of bondage was pleaded in 1618, and, though a few cases of servitude lingered on, it shortly became extinct.

With the growth of commutation went also the transformation of the farm, and the rise of the wage-system. Where, as in the case of the chapter of St. Paul's, a general assessment of a certain amount of produce for the benefit of the chapter was made upon all the manorial estates of a lord, each estate was put under the charge of a *firmarius*, who acted toward that estate *in loco domini*, retaining for himself all received over and above the assessment. The *firmarius* was sometimes one of the residentiary canons, as at St. Paul's, sometimes the bailiff or steward, sometimes the village itself. The inconvenience of transportation, and the growth of money payments within the village, soon necessitated a single cash payment, though for a time it was optional for the lord to receive either produce or money. Rentals became very common after the 13th century.

The payment of wages began as a commutation of labour either during special seasons of the year or for special classes of work. Week-work was probably the first labour to be commuted, and *precariæ* probably were the last. Hired labourers were in the first instances the old villeins. In the 13th century labourers engaged in threshing, winnowing, mowing, and harvesting were paid a regular wage, as also were those engaged in special duties, as the swine-herd, sheep-herd, and others, who in earlier times received perquisites or exemption from certain duties. Many of these were doubtless freeholders, and the custom first began upon the lord's demesne. The use of hired labour increased in the period preceding the Black Death, but that event struck it a severe blow. The increase of leases and sheep farms was an unavoidable result of the scarcity of labour. But, as the population recovered itself, commutation made it necessary and possible for the lord to hire labourers, and in the 15th century such labour was generally paid by piece-work. By 1450 there existed on every manor, besides the freeholders and customary tenants, a small body of labourers who were largely dependent on wages, though they supported themselves from the produce of small plots of land as well. But the class of wage-receivers was not confined to those resident on the estate. Itinerant artisans, serving sometimes two or three villages, sometimes a number of manors, passed from place to place paid by the day because unattached to a holding. It is probable, however, that some manors still retained their own smiths, wrights, shoemakers, etc.

The changes which altered the agrarian condition of England made the dissolution of the village community most evident. The manor house and the lord's demesne, the freehold plots, the lands in villeinage, the meadows, pastures, commons and waste were parts of one organic whole. But when a profit-gaining economy took the place of the old self-sufficing economy; when a stage of industry took the place of a stage of agriculture, to be in turn supplanted by an era of commerce and trade; when a convertible husbandry followed by rotation of crops took the place of the open-field system, then this agrarian unit dissolved. The earliest change in the primitive order was the introduction of the cottar holdings in Anglo-Saxon times, and of the freeholdings later. After the conquest, portions of demesne fell into the hands of rent-payers, and small holders and irregular plots increased. The earliest innovations took place on the demesne lands, which, as directly under the charge of the bailiff, were let out or enclosed for pasture. There is reason for thinking that by the 15th century the lords had succeeded in partially withdrawing their portions from the open fields. The process of inclosing lands not merely for sheep-rearing, but for more economical husbandry, began with the demesne, the freeholder's plots, and the common. The enclosure of the common fields, and the eviction of tenants which began in the 15th century, is the most important phase of the new movement, and some doubt exists regarding the security or insecurity of villein tenure. The evictors were lords of manors, *firmarii*, and the customary tenants themselves; the evicted were doubtless *nativi*, holders *ad voluntatem* on the lord's demesne and waste, and customary tenants holding in the open fields. Evictions cannot have been limited to any special class. Freehold evictions are occasionally recorded, though this was clearly illegal (see Leadam, *Inquisition*

of 1517, p. 189). On the whole, security of tenure for the customary tenants, and later the copyholders, seems assured, although it would be rash to offer a final opinion until a thorough examination has been made of manorial court rolls. Enclosures of demesne, meadow, and pasture, important as they were in transforming the appearance of the old manor, were not so vital to the mediæval economy as were the enclosures of the open fields. These struck at the root of the old system, and when complete, the agrarian individuality of the manor was destroyed. The minute subdivisions of the old virgate system had already begun to give way to the union of strips whenever possible, and the two processes continued side by side through the 18th century. The enclosure of the common fields was at its height in the latter part of the 15th century, and again from 1760 to 1844, when nearly 4000 acts were passed (see ENCLOSURES). These acts were the result of new economic conditions due to rotation of crops, the demand for food from manufacturing towns, and the increase of capital. England could not afford to retain the open field system; it was too uneconomical. Its place was filled by a system of consolidated farms, large capitalists, and division of labour. Traces of the old order can be seen not infrequently to-day, as near Manchester, in Gloucestershire at Upton, at Stogoursey near Bridgewater.

If commutation and enclosure affected chiefly the agricultural element of the manor, the loss of rights of justice affected the seignorial element. Under Henry III., so extensive were the assumptions of REGALIA by the lords, and so effective were their encroachments upon the jurisdiction of the king's justices, that the period preceding the reign of Edward I. may be considered as the era of greatest manorial jurisdiction. This led to an inquiry by king Edward into the seignorial warrant for such privileges, the important results of which were the return known as the HUNDRED ROLLS, the Statute of Gloucester of 1278, the writ Quo Warranto, and a general limitation of the franchises, although the forfeited privileges were often restored for a sum of money. The end of the 13th century marks, therefore, the beginning of the decay of the larger jurisdiction of the manorial courts. They lost in large part the exercise of high justice, and by interpretation of the Statute of Gloucester actions in civil cases were limited to forty shillings. The courts became local, possessing a mixed civil and criminal jurisdiction of a limited character. The presentment was made by the full court, or by the body of selected jurors, and the law of the court was mainly the custom of the manor. Through the 13th and 14th centuries there seems to be no evidence to show that there was more than one court upon the manor, or more than one way of constituting that court. In time, however, a distinction began to be made between cases that affected free men and those that affected unfree men, and the court baron, the court of the free tenants, and the customary court, the court of the villeins, made their appearance. Much earlier, however, many lords had begun to exercise a royal franchise in the view of FRANKPLEDGE twice a year; occasionally oftener. This was the beginning of the court leet, a name which appears toward the end of the 13th century. The correct title of this court was, however, always, *Visus franciplegii*.[1] The court baron and the customary courts were lord's courts and existed on all manors. The court leet was the king's court, and existed only on such manors as had the view of frankpledge. In the former the suitors were the judges, in the latter the lord or his steward. With the decay of villeinage the customary court ceased to be held, while the officers and functions of the court leet steadily increased by statute. The court baron and the court leet became the only local courts (except the *curia militum*) in the 15th century. The former concerned itself with tenures, admittances, rents, trespasses, civil actions of forty shillings, waifs and strays, etc.; the latter took the view of frankpledge, preserved the ASSIZE OF BREAD AND BEER, judged breaches of the peace, regulated commons, fences, nuisances, etc. But the intricacies of their own cumbersome machinery led to a rapid cessation of their activity. Their judicial power in civil cases was nearly gone by the time of Henry VIII., and there seems to have been a period between this time and the rise of the justice boards, established by many towns and parishes for their own needs, when many of the lesser cases were not taken up at all. Still, on some manors, with the increase of duties under new statutes, the activity of the courts continued. Though they met with regularity, yet the cases with which they concerned themselves grew fewer and fewer, until by the beginning of the 18th century the court leet had practically fallen into disuse. Its functions have been absorbed by municipal authorities, local boards, sanitary authorities, etc.

[The literature of the manor is so extensive that it will be possible to indicate here only the representative works upon the subject. Palgrave, Kemble, Freeman, Stubbs, Maine, Green, and others have discussed the origin and earlier history from the older point of view. For more recent opinions, see Seebohm's *English Village Community*, 1883.—Ashley, *Economic History*, pt. i. ch. i. 1888.—Earle, Introduction to *Land Charters and Other Saxonic Documents*, 1888.—Andrews, *Old English Manor*, 1892. MANSFIELD, WILLIAM MURRAY, FIRST EARL OF (1705-1793), lord chief justice of England from 1756-1788, and leader of the tory party which opposed the great Pitt. Murray was called to the bar in 1731. In 1742, he entered parliament as member for Boroughbridge, and was created solicitor-general. In 1754 he became leader of the House of Commons, and attorney-general. In 1756 he was created a peer by the title of Baron Mansfield of Mansfield, Notts, and made chief justice of the King's Bench, an office which he held for over thirty years, until obliged to resign through bodily infirmity. During his long occupation of the bench, Lord Mansfield was busied in reforming many abuses of procedure, and was noted for his prompt and admirable judgments.

Mr. Justice Buller, in delivering an important judgment, observed that Lord Mansfield might be called "the founder of the commercial law of this country." In this sense his influence over business transactions has been long enduring.

A. L.

MANSUS (MANSUM), generally the chief mansion, manor house, hall, or court of a lord; but the word has several shades of meaning, including *farm*. Brompton (Twysden's *Decem Scriptores*, 913, 12) uses it for the house of a chieftain; Richard of Hexham writes of a *mansum* in Carlisle granted to his monastery, and of a *mansum* elsewhere, for use for the herring-fishery; Matthew Paris mentions a *mansus* suitable for a vicar of a church, in fact, a manse. It is used in other cases (Ramsey, *Cartul.* i. 284-5) in which it implies a house with land around it inhabited by a husbandman. For the word as a measure of land, see Stubbs, *Constit. Hist.*, i. 83, n. 2 (1880).

E. CA.

MANUFACTURE. As in the cognate instance of the word factory (see FACTORY SYSTEM), a remarkable transformation has occurred in both the popular and technical meanings of the word manufacture. Originally this term signified hand labour, as its derivation indicates, but now more generally machine labour—exercised in the production of a saleable commodity. In the opinion of some authorities, indeed, this transformation has been complete. "Manufacture," says Dr. Ure (*Philosophy of Manufacture*, bk. i.), "is a word which in the vicissitudes of language has come to signify the *reverse* of its intrinsic meaning, for . . . the most perfect manufacture is that which dispenses entirely with hand labour." This statement seems rather too uncompromising in view of well-known facts. It was not quite correct to say then, and it is certainly not correct to say now, that either in technical or popular parlance manufacture invariably connotes the idea of machinery. It may be that factory legislation has shown a tendency in that direction, but it is also a tendency at issue with some among its own express enactments. Thus the Factory Acts Extension Act 1867 contained a definition of "manufacturing process" as "any *manual*

labour exercised by way of trade or for purposes of gain in or incidental to the making of any article"; and this conception is continued throughout subsequent acts without any further qualification. A distinction, indeed, is also made in them between *making* and *manufacturing*, which might appear to give some colour to the above presumption: commodities being held in a general way to be made or manufactured according as to whether the productive act is performed in a factory or workshop—that is to say, by hand only or with the assistance of other motive power; but from this general implication a considerable number of purely manual industries were nevertheless excepted from the first and made factory industries by law. Still less is Dr. Ure's definition acceptable to popular usage. In ordinary conversation it is commonly the comparative size of producing establishments which decides whether they shall be styled manufactories, and, more properly, the circumstance of whether the industries pursued there are carried on by means of congregated and divided labour. Mr. BABBAGE (*Economy of Machinery and Manufactures*, ch. xiii.) makes the distinction here under discussion in something like that way. "A considerable difference exists," he says, "between the terms *making* and *manufacturing*. The former refers to the production of a small, the latter to that of a large number of individuals"; and in fact it is difficult, in view of the rapid changes in productive methods together with the vagaries of statutory treatment, to ignore the element of magnitude as one necessary criterion of any sound working definition. Some novel and interesting views on this subject are propounded by Marx (*Capital*, pt. iv.). The organisation of manufacture, he contends, "has two fundamental forms—" that in which the manufactured article "results from the mere mechanical fitting together of partial products made independently," and where it "owes its completed shape to a series of connected processes and manipulations." He passes these two forms under review, naming them respectively heterogeneous and serial manufacture, and raising some nice distinctions between them, but to no great practical result. He is content to find, finally, in the division of labour "the distinguishing principle of manufacture"; and this, with some accretions born of modern mechanical methods of production, is probably as near to a specific idea of the nature of the process as, in the absence of a more authoritative definition of it, we can attain.

[Dr. Ure, *Philosophy of Manufactures*, Bohn's ed., 1861.—Charles Babbage, *Economy of Machinery and Manufactures*, 1846.—Karl Marx, *Capital*, English translation, 1887.—R. W. Cooke-Taylor, *Introduction to a History of the Factory System*, 1886, ch. i.—George Jarvis Notcutt, *The Factory and Workshop Acts*, 2nd ed., 1879.] R. W. C. T.

MANUMISSION. The act of freeing a slave or serf. A term adopted from Roman law. In the early Roman republic this could only be accomplished by a solemn public act in one of three ways: (1) *per vindictum*, a ceremony before the prætor; (2) *per censum, i.e.*, the enrolment of the slave's name on the quinquennial census of Roman citizens; (3) by testament; the slave becoming in each case a Roman citizen. Later, slaves were freed more simply, but with restrictions on the number freed; and freedmen were not admitted to full citizenship. Justinian however abolished these restrictions and made all freedmen citizens. In England, at the time of the Norman Conquest, the act of manumitting a serf was a symbolical one. The lord led his villein before the sheriff in a full meeting of the country or to some other public place such as a church, and there declared his intention of setting him free, invested him with the freeman's arms, the sword and spear, pointed to the roads lying open to him in all directions, and the ceremony was complete. In later times manumission was effected either directly by charter or indirectly by a collusive action at law, in which the serf was, with his lord's consent, made to occupy a position which could only be occupied by a free man.

[Du Cange, *Glossarium mediæ et infimæ Latinitatis*.—Pollock and Maitland, *History of English Law*, Cambridge, 1895.—Hunter, *Roman Law*.] A. E. S.

MANUOPERATIONES (MANOPERA). These form one of the three great classes of service anciently due from manorial tenants to their lords, the others being *araturæ* and *averagia*, ploughings and carryings. The *manopera* were rendered in actual labour, principally of a purely agricultural character, and are frequently described in cartularies under the terms *operationes*, *hand-dainæ*, *day-werke* or *week-work*. These were in a special way a mark of servile status, but like other indications of that kind, cannot be absolutely trusted without clear confirmatory evidence. In the 13th-century manorial extents, in the Ramsey cartulary, many instances of day-labour occur, with values of the service attached. In one case the labour of a man for five days in the week, on unspecified and therefore probably miscellaneous, services from 1st August to 29th September, is reckoned to be worth four shillings to the monastery, about a penny a day. In a case in the Gloucester cartulary, iii. 54, the valuation is only one half-penny a day.

[Vinogradoff, *Villainage in England*, pp. 287, 288.—Seebohm, *English Village Community*, 2nd ed., p. 79.—Ramsey Cartul., Rolls Series.] R. H.

MANZONI, ALEXANDER (1784-1873), the celebrated Italian poet and novelist.

Between 1821 and 1823 he wrote the work which entitles him to notice in these pages,

—*I promessi Sposi* (The betrothed Lovers), a romance. The story is based on an elaborate study of the social conditions of the people of Lombardy in the 17th century, of interest to the economic student. Manzoni was a fervent patriot.

He lived quite retired from the world. In 1834 he published his *Osservazioni sulla morale Cattolica*, a defence of his religion against the attack made by Sismondi in the 127th chapter of his *Italian Republics*. In 1842 appeared Manzoni's *Storia della colonna infame*, an historic appendix to the description of the Plague of 1630, which forms the most interesting episode in his *Promessi Sposi*.

In 1860, Manzoni was nominated a senator of the kingdom of Sardinia.

I promessi Sposi, storia Milanese del secolo xvii., Paris, 1827, 3 vols. 12mo. The best French translation is that of Rey-Dusseuil, Paris, 1828, 5 vols., 12mo, 1841, 12mo. English trans., the Minerva Library, ed. by G. T. Bettany, 1889.

[See Cossa on the success with which Manzoni maintained that the study of economics was not incompatible with sound moral principle.—Cossa, *Introduction to the Study of Pol. Econ.*, p. 107, Eng. trans., London, 1893.] A. L.

MARACHIO, Massimo (18th century), a Venetian ; one of the later absolute defenders of trade corporations. In 1789, the academy of agriculture, arts, and commerce of Verona offered a prize on the then much debated question : Is it advisable or not to allow trades to be united in corporations with power of control and privileges ; what are the advantages and disadvantages of this ?

Marachio sent in an essay, full of mistakes and prejudice, inspired with ideas of a most exclusive character, in defence of the corporations. He complains of certain abuses in them, but on the whole considers them excellent ; arguing in their defence against the many writers who opposed their privileges. He advocates minute division of trades, and attributes the faults of the system entirely to human weakness.

Istituto di tenere in corpi le arti riguardato nelle sue teorie e nelle sue forme, Venice, 1794.

MARC. See Measures and Weights.

MARCET, Mrs. Jane (1769-1858), was the daughter of Francis Haldimand, a Swiss merchant resident in London. She married in 1799 Dr. Alexander Marcet, a physician of distinction, and published in 1806 *Conversations on Chemistry*, a book for beginners which had an enormous success. This was followed by *Conversations on Political Economy, in which the Elements of that Science are familiarly explained* in 1816, and by numerous other works, among which *John Hopkins' Notions on Political Economy*, 1833, and *Rich and Poor*, 1851, relate to the subject of this dictionary. The first edition of the *Conversations on Political Economy* is of some importance to the historian of economic theory, as it shows what were the accepted doctrines just before Ricardo's *Principles* appeared. J. B. Say remarks that it "presents very good principles in a very pleasant form" (*Traité*, 8vo ed. p. 42 n.), and Ricardo uses a phrase which implies that it generally keeps "on neutral ground" (*Letters*, ed. Bonar, p. 133). In regard to the theory of rent it shows how much of Ricardo's work was already done by the discussions in which he had taken part about the corn law. In regard to profits, it appears rather to halt between the Smithian and the Ricardian view. The rate of wages, it says plainly, "depends upon the proportion which capital bears to the labouring part of the population of the country" (p. 117). It contains J. S. Mill's first fundamental proposition respecting capital, almost in the same words—"industry is limited by the extent of capital" (p. 153). A second edition was called for very soon (Ricardo's *Letters*, ed. Bonar, p. 132), and published in 1817, and a seventh was reached by 1839. Though the fact does not appear to be recognised or stated in any case except that of Miss Martineau (*Autobiography*, vol. i. p. 138), it is probable that the work exercised considerable influence on the economic theory of the middle of the 19th century by helping to form the first impressions of young economists. The other two economic works are of less importance. The fact that they were intended, in part at any rate, for the use of the working class, shows a significant change of opinion, inasmuch as in the *Conversations* the principal interlocutor gives a ready adhesion to the exclamation of her pupil, "Surely you would not teach political economy to the labouring classes, Mrs. B. ?" The tendency of *Rich and Poor* is sufficiently indicated by the following passage from the preface : "These dialogues contain a few of the first principles of political economy, and are intended for the use of children, whether rich or poor. No portion of that science is more important to the lower classes, as it teaches them that the rich are their friends, not their foes."

[*Dict. Nat. Biog.* and works cited in text.] E. C.

MARESCOTTI, Angelo (1815-1892). Born in Lugo in Romagna, Italy. He first studied medicine, which he practised until 1848, he then took part in the wars of Italian independence, and was entrusted with important political duties in 1859. Afterwards he became a deputy and finally senator of the kingdom of Italy. He was appointed professor of political economy at the university of Bologna, which chair he held for many years. "Italy," wrote Minghetti, "owes her thanks to Romagnosi and Marescotti for making her first aware of that

harmony between the elements of law and economics which we find so well sustained by German economists."

Marescotti wrote many economic works, often brusque in style. Amongst them we note the following :—

Discorsi sulla economia sociale (4 vols.), 1856.—*Le finanze e gli organismi finanziarii*, 1867.—*Conferenze sull' economia studiata col metodo positivo*, 1878.—*I fenomeni economici e le loro cause*, 1880.—*La legislazione sociale e la questione economica*, 1886.—*L' economia sociale e l' esperienza*, 1888.

U. R.

MARGIN (in monetary transactions). On a security the difference between the amount advanced against goods or securities and their market value. In the practice of banking this ranges from 10 to 25 per cent according to the nature of the pledge, and the usual range of fluctuations in its value. Should the security become depreciated, the margin has to be kept up by an additional deposit. Speculation "upon margins" or "upon cover" is conducted upon the deposit of a certain amount of cash, usually 5 or 10 per cent of the value of the purchase, the transaction being closed immediately the cover has "run off." Business of this sort in relation to stocks or shares is usually conducted by brokers outside the stock exchange; and for speculation "upon margins" in produce of different kinds special institutions exist, as the Produce Clearing House in London; and similar organisations in other cities (see CLEARING SYSTEM).

R. W. B.

MARGIN (in economics) denotes a limit fixing the position of economic equilibrium. If, in mathematical language, the advantage of the economic man is regarded as a function of several variables, those values of the variables for which the value of the function is a maximum, are margins. There are thus as many margins as there are variable economic quantities. They may be classified under the heads (I.) production, and (II.) consumption.

I. Producers being divided into (A) the owners of AGENTS OF PRODUCTION, of three species, and (B) the ENTREPRENEUR; we have a corresponding classification of margins.

A. (1) There is the "final" or marginal disutility of labour. "Labour will be carried on until the increment of utility from any of the employments just balances the increment of pain" (Jevons's *Theory of Political Economy*, ch. v. p. 201, 2nd. ed.). It is argued by Prof. Patten (*Dynamical Political Economy*) that in a prosperous society where amusements are open to the labourer, and the choice between work and rest is not his only one, he will not work on up to the limit of marginal disutility; "disutility" implying positive pain, not merely diminution of pleasure. It seems best to define with Prof. Marshall "the discommodity of labour" as what "may arise from bodily or mental fatigue, or from its being carried on in unhealthy surroundings, or with unwelcome associates, or from its occupying time that is wanted for pastime, or for social and intellectual pursuits" (*Principles of Economics*, 3rd ed. bk. iv. ch. 1, § 2). (2) There is also for the capitalist a margin of investment; a point at which he will decline to forego present consumption for the sake of the "discounted pleasures" of the future (Marshall, *Principles*, bk. v. ch. iv. § 1 *et passim*). (3) The landlord's offer of his agent of production is not limited by a margin on the supposition that he has no other use for the land. But where he has a choice between letting the land and using it for his own pleasure or profit, there may be a margin limiting the amount.

B. The outlay of the entrepreneur on each factor is similarly pushed up to a margin. There will be (1) a "marginal shepherd" (Marshall), and (2) a marginal "dose" of capital. The idea of a marginal increment of land (3) is less familiar, but is discernible in the case of a manufacturer hesitating whether he will rent an additional site for a new building, or add a new story to an old building (Marshall, *Principles*, bk. v. ch. viii. § 6). The older writers employ the idea if not the term with reference not to the quantity, but the quality of the land rented (Ricardo, *Pol. Econ.*, ch. ii.; Mill, *Pol. Econ.*, bk. iv. ch. iii. § 5). The "margin of cultivation" denotes the lowest quality of land which is just worth the farmer's while to cultivate "below which the cultivation of land cannot descend" (Fawcett, *Manual*, bk. ii. ch. iii.).

The entrepreneur's products are sold either to other entrepreneurs, whose purchases have been already considered under the head of capital, or (II.) to consumers who extend their outlay on each commodity up to a certain margin. The margin of consumption is defined by the condition that in every branch of a consumer's expenditure, the "last" increment of money—that pound, or penny, about the application of which he hesitates—will procure the same amount of utility, called "marginal" or "final." Of course the marginal utility procured by a unit of money may differ for different consumers, and for the same consumers at different times.

Margin thus conceived as a point of maximum advantage is correlative to that quantity which it is sought to maximise; sometimes called a RENT or Surplus.

[The subject is treated by almost all mathematical economists, and by those who employ more or less clear mathematical conceptions without explicit symbols. Jevons's exposition of "final" utility in his *Theory of Pol. Ec.* forms an admirable introduction to the subject. The fullest and most accurate exposition of the different kinds of margin and their relations is to be found in Prof. Marshall's *Princ. of Econ.* A clear and simple statement, unencumbered by mathematical phraseology, is

given by Prof. J. B. Clark in his paper on the *Three Rents*. A similar praise is deserved by the writings of the Austrian school, so far as the general principle is not obscured by their peculiar doctrines of "pseudo-marginal" utility, "imputed" value, and other "casuistical complications." The marginal value of money is treated by Prof. V. Pareto and Signor Barone in the course of a series of articles in the *Giornale degli Economisti*, which are summarised in the *Economic Journal* for March 1895. The unit in which marginal utility is to be measured is considered by Dr. Irving Fisher in his *Mathematical Investigation*. He has exhibited the analogies between economic margin and physical equilibrium. See also *The Alphabet of Economic Science*, 1888, by Wicksteed, who first used the phrase "marginal" instead of "final utility," and FINAL DEGREE OF UTILITY.] F. Y. E.

MARGINAL LABOUR. See MARGIN.

MARGINAL UTILITY. See FINAL DEGREE OF UTILITY and MARGIN.

MARIANA, JUAN DE (1536-1623). This celebrated Jesuit father, best known by his *Historia de España* and his apology of tyrannicide in his treatise *De Rege et Regis Institutione*, lectured during his youth on theology in Rome and in Sicily, and on the doctrines of St. Thomas Aquinas for five years at the university of Paris. At the end of an absence of fifteen years he returned to Spain and settled in Toledo, where he resided until his death. The publication of his treatise *De Monetæ Mutatione*, which he himself translated into Spanish, brought him into trouble, and he was confined for a year in a convent in Madrid. Some bold strictures on the Society of Jesus, to which he belonged, entitled *Discursus de Erroribus qui in formâ gubernationis Societatis Jesu occurrunt*, written after the elections of the Neapolitan Acquaviva as General, bitterly complained of the ruin of Spanish influence at Rome.

In 1609, at the date when Mariana wrote his treatise *On the Alteration of Money*, the Duke of Lerma was flooding Castile with masses of debased small coins (*vellon*), a practice which, under the influence of the so-called *arbitristas*, or financial schemers, did not abate until the accession of the Bourbon dynasty. Charles V. and Philip II., although not irreproachable, had been far more cautious in this respect than their successors. Mariana fearlessly maintained that "the king, having no right to tax his subjects without their consent," had no right to lower the weight or the quality of the coinage without their acquiescence. "Two things are certain: the king enjoys the prerogative to alter the outward form of the coins, provided he does not make them worse than they were before; . . . secondly, in case of necessity —as, for instance, during a war—he may be allowed to lower the coinage under two conditions —the first that this be done for a short time not exceeding the period of necessity; the second that, the necessity being over, due damages be granted to the people who have suffered (ch. iii.)." But, "money having two values—one intrinsic and natural which depends on the purity and weight of the metal, to which may be added the cost of the coinage, which is worth something; and a second value, which may be called legal and extrinsic, fixed by the prince, . . . the real use of money — what has always been done in well-managed states—is secured when these two values are exactly adjusted (ch. iv.)." The following chapters give historical details on the Spanish mint.

Three chapters of the *De Rege* are also devoted to economic subjects: taxation, the means of subsistence, and the poor; here also Mariana evinces his strong spirit of justice, as when he opposes taxation of necessaries, but his views on foreign imports, the cultivation of corn, etc., are mainly those of his contemporaries.

The tract on money was printed at Cologne in 1609, and the *De Rege* at Toledo in 1599 and Frankfort in 1611. Both are published (in Spanish) in the *Obras de Mariana* in the *Coleccion de Autores Españoles* of Rivadeneyra (2 vols., Madrid, 1854).

[Dr. Contzen, in his *Geschichte der volkwirtschaftlichen Literatur im Mittelalter* (1872), deals almost exclusively with the treatise *De Rege*, of which he gives a summary analysis (pp. 207-222). —See also the article "Mariana" in Bayle's *Dictionnaire Historique*.—Hallam, *Literary History of Europe*, ii. pp. 142-144 (edit. 1872).—Colmeiro, *Historia de la Economia Politica en España*, ii. pp. 476-484.] E. Ca.

MARINE INSURANCE. See INSURANCE, MARINE.

MARITAGIUM. Usually *maritagium* means the feudal right of a guardian to give in marriage his ward, whether male or female, though the word often means the dowry or estate which passes to the husband with the lady. At other times it is used in the sense of *valor maritagii*, the sum the guardian could get for the match by sale. It is asserted that in the reign of Henry III. a sum of 10,000 marks was paid on one occasion. On the other hand in the Pipe Roll of 5 Hen. II., p. 65, there is a payment of 5 marks. An interesting case which illustrates the subject, and supplies original documents, may be found in the *Chronicon Petroburgense*, Camden Society, 1849, pp. 61, 62, and 72-77.

[Ducange, *Glossarium mediæ et infimæ Latinitatis* (Henschel and Favre).—Hallam, *Middle Ages*, c. 2, pt. 1.] R. H.

MARITIMA ANGLIÆ is defined by Cowell as the revenue accruing to the king from his rights over the sea. It included such items as wreck and fish royal, the latter being all whales and sturgeon cast upon the seashore. This revenue was originally accounted for by the sheriff of each county, but in later times was entrusted to the admiral (see DROITS OF ADMIRALTY).

[Cowell, *Interpreter*.— Blackstone, *Commentaries*.] A. E. S.

MARK (English money). The Anglo-Saxon mark, as well as the half-mark, was money of account only, in value 13s. 4d., reckoned in

either gold or silver as equivalent to 3600 grs. troy of silver. Its value early in the 10th century was estimated at 100 pennies, but in the 12th and afterwards the mark was worth 160 pennies. It was a denomination probably of Danish origin, and is first found in 878.

[Eccleston, *Introd. to English Antiquities.*—Ellis, *Introd. to Domesday*, i. 164.] E. G. P.

MARK (GERMAN). In 1873 the gold mark, of 100 pfennige, was adopted as the standard of value, and as the money of account, of the new German Empire.

The mark consists of ·3982 grammes (6·146 grains) of gold 900 fine, and is equal to English standard gold of the value of 11·747 pence.

There is no standard coin of less value than five marks, the metallic currency consisting of the following pieces:

COINS OF THE GERMAN EMPIRE.

Standard Coins, Gold.

Denomination.	Weight.		Fineness.	Value in gold 916·6 fine at £3:17:10½ per oz.
	Grms.	Grains.		s. d.
Twenty marks	7·965	122·917	900	19 6¾
Ten marks	3·982	61·458	900	9 9¼
Five marks	1·991	30·729	900	4 10¾

Subsidiary Coins, Silver.

Denomination.	Weight.		Fineness.	Value in silver at 5s. 6d. an oz.
	Grms.	Grains.		s. d.
Five marks	27·777	428·676	900	4 10¾
Two marks	11·111	171·470	900	1 11½
Mark	5·555	85·735	900	11¾
Fifty pfennige	2·777	42·867	900	5⅞
Twenty pfennige	1·111	17·148	900	2⅛

In addition to the above gold and silver coins there are nickel pieces of the nominal value of 20, 10, and 5 pfennige, and copper pieces of 2 pfennige and 1 pfennige.

The valuation at which the subsidiary silver coins are current bears practically the same ratio to that of the gold pieces as in the case of British coin; the value of the standard gold mark exceeding that of the silver mark piece, when reckoned at 5s. 6d. an oz. troy, to the extent only of ·27d.

The total amount of German imperial coin issued since its introduction in 1873 to the 31st December 1903 is given below. The coins have been manufactured at the mints of Berlin, Munich, Dresden (now Muldene Hütte), Stuttgart, Carlsruhe, Hamburg, Hanover, Frankfort, and Darmstadt.

IMPERIAL GERMAN COINAGE, 1873-1903.

	Marks.	£
Gold	4,000,677,405	200,033,871
Silver	699,458,144	34,972,907
Nickel	75,935,769	3,796,788
Bronze	16,136,884	806,844
Total	4,792,208,203	239,610,410

F. E. A.

MARK SYSTEM, THE, is the term customarily used to designate the social and agrarian organisation of society which, it has been believed, preceded the manorial and feudal systems, and formed the basis upon which those systems rested (see FEUDALISM; MANOR). The unit of this system is the mark, a region greater or less in extent, independent, isolated, and occupied by a group of self-governing cultivators, politically free, who held and cultivated land in common with periodical distribution of the arable. The essential characteristics of the mark system are, therefore, personal freedom, self-government, and communal ownership of land.

The mark theory has occupied so important a place in modern historical and economic discussion that a brief résumé of the circumstances of its origin and development is necessary. The theory did not spring full grown upon the world; that portion of the theory which relates to the freedom and the social status of the primitive marksman has a long history behind it. *A priori* reasoning has tended at all times to give to man at the beginning of his economic and political development certain natural rights. Independent of and preceding any theory of the mark, these accepted teachings regarding primitive man were based upon the ancient philosophy, the Bible, and the *jus naturale* that entered into the mediæval thought at the time of the reinvigoration of the Roman law. This idea of original freedom was present in the dogmas of the church, and was vaguely and speculatively held by the philosophers of the 18th century. Through the teaching of Rousseau it became a political power, while it entered the economic system through the speculations of the PHYSIOCRATS. From the same source there sprang the cardinal doctrine of the romantic school, namely, the freedom of the natural man; and the whole theory became more definite when it was used as a political weapon against reactionism in France and Germany, and for reform in England by the liberal school. This school in its analysis of the fundamental rights of man brought into being the imposing figure of the primitive Teuton, thus localising the theory. Grimm and others, as the result of their studies in Germanic origins and philology, believed that the primitive Germans lived in groups, the members of which were united by ties of blood and religion. When this point was reached the

agrarian element only was needed to complete the theory.

In the period from 1840 to 1850 certain historical students, Olufsen, Haxthausen, and Hanssen, began to investigate the subject of the village communities of Denmark and lower Germany; and in 1854, after years of penetrating and exhaustive study, von Maurer published the results of his researches in the same field. In consequence of these investigations and of the conclusions drawn from them, the group, *sibbe* or *sept*, of Grimm and his fellow scholars became a part of the primitive social unit, the village community, with its open fields, communal land-holding, and co-operative agriculture. In the meantime in England, Kemble, representing the new historical interest in Anglo-Saxon institutions, the desire for precedent in the reform agitation of the period from 1832 to 1846, and, under the stimulus of German romanticism, the spirit of German historical investigation, had presented, five years before von Maurer's work appeared, a similar theory for England. His theory, however, was characterised by vagueness and by absence of detail. To him the original settlement was based on possession of land only, and the smallest and simplest of the divisions was the mark. The word mark, as used by Kemble, connoted:— first, the forests and wastes beyond the arable, that is, the boundary land that separated the possessions of one community from those of another; secondly, the whole district occupied by the community; and finally the community itself, a group of families or households, settled on the plot enclosed by the boundary. The original basis of Teutonic society was, he thought, this community, a voluntary association of freemen, originally united by ties of blood—a relation, however, that in the process of time tended to give way to territorial and political interests. This group, zealously excluding others, developed and carried on a system of cultivation for the good of all its members. Various marks covering England, existing in independence and isolation, seised of full power and authority to regulate their own affairs, differed greatly in size, powers, and customs. Each possessed a court, and exercised supreme jurisdiction. Kemble was indebted for the first idea of the mark to the writings of Zeuss and Grimm, and he found evidential support for it in the occurrence in Beowulf and the charters of the words *mearcmôt*, *mearcbeorh*, *mearclond*, and furthermore in patronymics, and on these he laid great stress. He represented the marks as "great family unions comprising households of various degrees of wealth, rank, and authority; some in direct descent from the common ancestors, or from the hero of the particular tribe, others more distantly connected, through the natural result of increasing population; some admitted into communion by marriage, others by adoption, others even by emancipation, but all recognising a brotherhood, a kinmanship, or sibsceaft; all standing together as one unit in respect of other similar communities; all governed by the same judges, and led by the same captains; all sharing in the same religious rites, and all known to themselves and their neighbours by one general name" (*Saxons in England*, vol. i. pp. 56-57).

Beyond the evidence above mentioned, Kemble brought forward nothing to support his view. But von Maurer in Germany did what Kemble had not done, he gave the minutest detail of the social and agrarian life, and supported it with what seemed to be indisputable evidence, namely, the customs of the 11th and 12th centuries, which he considered the survivals of an earlier age, and the occasional statements in earlier documents, which he interpreted in the light of the mark theory. In 1869 Nasse strengthened the theory by further English evidence, drawn from the laws and charters. But he, taking the existence of the mark for granted, concerned himself chiefly with the agrarian aspects; and, although he recognised the presence of free peasant proprietors and found traces of communalism, he hardly touched the questions of freedom and communal ownership.

It was left for Sir Henry Maine and Emile de LAVELEYE to extend and to give greater currency to the conclusions already reached. In 1871 Maine, in his *Village Communities in the East and West*, both summarised the views thus far presented by Maurer, Nasse, Landau, Gessner, Haxthausen, and others, and widened the field of investigation by evidence collected in India. Here he saw, not survivals of primitive life, but actual communities, living types of the western mark. The Indian village community became of great importance, and Maine threw out suggestions for further investigation in calling attention to the village communities of America and to the house communities of the South Slavonians. This phase of the subject found expression and elaborate extension in Laveleye's *De la propriété et de ses formes primitives*, 1877, in which was gathered evidence from almost every part of the globe to show the universality of the mark system and of its analogues. When this point had been reached historical scholars very generally accepted the theory. Maine readily transformed the mark into the manor through the extension of Kemble's idea regarding the first marksman; and Freeman and others, following further suggestions of Kemble, and conceiving of history as a continuous development, brought forward the theory that the mark was the germ whence had evolved the life of the state, the protoplasmic cell, containing within itself, as it were, the laws of its own growth.

But in a theory based so largely upon subjective foundations a reaction was inevitable. As historical criticism became keener the evidence appeared more and more insufficient and incohesive; with the change of political ideals, the question came to be recognised as strictly historical; exaggerations due to over-enthusiasm underwent correction, and gradually the problem was reduced to its proper proportions. The mark as drawn by Kemble and von Maurer is not at present supported by any historical scholars. The attack, as thus far completed, has destroyed the idealism of the primitive mark; it has disproved the exaggerated freedom of the Teuton, and the existence of the first marksman and the court of the mark; it has denied the Kemble-Maurer interpretation of the word *mearc* itself, and has thrown doubt upon the supposed symmetry of the primitive land system; it has made prominent the tribal character of early Teutonic life, and has questioned the independence and self-consciousness of the primitive folk; it has removed from the support of the theory the evidence from America, Russia, and Switzerland, and, through the work of Baden-Powell on *The Land Systems of British India*, it has struck a heavy blow at the accuracy of the evidence derived from the east; and, finally, it has demonstrated that except for a judicious use of the comparative method, the evidence for each country must be interpreted by itself.

The movement against the mark theory was practically begun by Seebohm in 1883 and by Fustel de Coulanges in various writings from 1886 to 1890. By them the two most essential characteristics, freedom and communal ownership, were categorically denied, and a theory of primitive serfdom and private property was substituted. This has given rise to a new school, which, denying the existence of the free village community, has connected manorial institutions directly with the tribal, has recognised a predominant influence of Roman custom, has set up the manor as the prevailing type of local life and has declared the mass of the population to have been originally in serfdom.

A large body of the more conservative historians still advocate, however, a modification of the old doctrine, and believe that Seebohm, Fustel de Coulanges, and their followers are too extreme in their views. The best representatives of this school, Vinogradoff, Round, Glasson, and Flach, are willing to admit the presence of private property, inequality, and in a measure serfdom, but assert the existence of a free village community stage differing from the tribal system on the one hand and the manorial on the other. Although recognising, at a later time, the coexistence of the village community and the manor, they would still preserve the essential characteristics of the mark system without its exaggerations.

MARKED CHEQUE. In London, after the clearing house closes, the bankers send round and present at the various offices any cheques that have been shut out of the clearing, a cashier being in waiting at each bank to "mark" or "answer" the cheques. Marked cheques are payable in the first clearing of the next day, and cannot be refused for any reason. In some places it is the practice of bankers to mark cheques drawn upon them by writing across the face "Good for £ ," the marking being officially signed. A cheque so marked is available for completing important transactions, thus avoiding the risk and trouble of carrying cash.

In the United States, and particularly in New York, the practice of marking, or "certifying," cheques has been carried to very great lengths. Certified cheques are largely used in daily business, especially by brokers, and the certification is given, in many cases, against securities, or even only on the credit of the drawer. By the National Bank Acts, banks organised under that system are prohibited from certifying cheques for amounts beyond that which the drawer has at his credit at the time, but banks organised under the laws of the state of New York are subject to no restrictions in the matter. By judicial decisions the certification of a cheque is an acceptance, and renders the bank liable indefinitely as to time of presentment.

[For extent of the practice in New York, see *Report, Comptroller of Currency*, Washington, 1882; also *Journal of Inst. of Bankers*, vol. iii. p. 400; and vol. v. p. 278.] R. W. B.

MARKET AS PLACE OF SALE. Determinate areas and times for intercourse between buyers and sellers were a necessity of trade before communication and transportation were facilitated by the inventions of the present century; and, even now, for the sale of some commodities, such as live stock and dairy produce, they are but slowly losing their practical importance, in spite of the modern middleman and shopkeeper.

In the middle ages the right to carry on trade, or to permit it to be carried on, at a particular time and place, was called, like the place itself, a *market* (Fr. *marché;* Ger. *Markt*); and this term included in its widest sense both the weekly or semi-weekly market, lasting but a few hours, and the more considerable annual mart, lasting several days, known as a fair (Fr. *foire;* G. *Messe, Jahrmarkt*). Coke lays it down that "every fair is a market, but every market is not a fair." The term *market* was, however, more commonly reserved for the smaller and more frequent assembly (Ger. *Wochenmarkt*); and these alone will be considered here (see FAIRS AND MARKETS; MEDIÆVAL FAIRS).

In England, during the later middle ages, not only did every borough possess a market, but also the lords of most considerable and of many inconsiderable villages; and the right to demand toll thereat was a valuable franchise. From an early date the right to establish a market was held to belong exclusively to the crown; and no market could be defended in the courts save upon the ground of such a grant or of immemorial prescription. In the 10th century an attempt seems to have been made by repeated decrees of the witan to limit all sales to "ports" or market-towns, a measure closely connected with the insistence upon the witness of "credible" men to every transaction. But this policy was either defeated or abandoned, for the number of markets in the rural manors evidently began to increase about this time. The Domesday Survey records some fifty markets or fraction of markets (*i.e.* rights to receive fractions of the profits), and it registers many complaints as to the setting up of markets without authority and the exaction of undue tolls. The pecuniary advantages derived from the possession of a market were, however, so large that every considerable magnate sought to obtain a grant from the crown, and many did not scruple to set up markets without waiting for permission. The chief obstacle to their success lay in the vested interests of markets already established. Before making a grant it was usual to inquire, on a writ *ad quod damnum*, whether it would be prejudicial to existing rights. When a market was established without a grant some neighbouring lord or borough was pretty sure to bring a suit against the new rival on account of the "nuisance" or "damage" he occasioned. The rule laid down by Bracton is that a market becomes a nuisance if set up within six miles and two-thirds of one already existing, on the ground that sellers could travel on foot that distance, sell their wares, and return within the compass of a day. The illegal assumption of market rights was probably put an end to by the *Quo Warranto* inquiries of Edward I. Grants of market privileges were made in the 13th century in more than 3000 instances, in the 14th in more than 1500. By that time the country was pretty well supplied with such facilities for trade; so that in the first 82 years of the 15th century only some 100 grants are to be found. By the first statute of Westminster (3 Ed. I. c. 31), the king was empowered to take into his own hand the franchises of markets where outrageous tolls were demanded. Markets were commonly held during the earlier centuries in churchyards and on Sundays. The former custom was prohibited by the statute of Winchester (13 Ed. I.); the latter was abandoned in many places early in the 13th century, as a result of the moving sermons of Eustace de Flay, and was finally prohibited by 27 Henry VI. c. 5. It was in the markets and by the market officers that the men of the middle ages sought to introduce and maintain their simple-minded ideals of trade. All the rules with regard to Forestalling (see FORESTALLERS AND REGRATORS) aimed at bringing consumer and producer as nearly as possible face to face in the open market. Yet while restrictive in some respects, in others market intercourse led to a relaxation of previous restraints. Thus during the period of the dominance of the merchant gild it was common to suspend on market days, in whole or in part, the regulations limiting freedom of trade on the part of non-members. And the same tendency is illustrated by the growth in England and abroad of the rule of MARKET OVERT, by which a *bona fide* sale, made on the market day and at the place assigned for the market, transfers the legal property of the thing sold to the vendee, so that his title is good against all save the king, however defective that of the vendor may be (see also MANOR).

[The English material for the history of fairs and markets is conveniently brought together in the Report by Messrs. Elton and Costelloe for the *Royal Commission on Market Rights*, vol. i. (1889). It has a large appendix of documents, a calendar of grants from 1 John to 22 Ed. IV., lists of fairs in 1792 and 1888, and a list of general and local acts of parliament. See also the chapter on "The Town Market" in Mrs. Green's *Town Life*, vol. ii. (1894). In many English and continental towns a stone cross was erected in the centre of the market place in the later middle ages. For a description of the farmers' wives and daughters sitting with their butter and eggs on the steps of the cross "until a certain hour in the afternoon, after which, if all their goods were not disposed of, they took them unwillingly to the shops and sold them at a lower price," see Mrs. Gaskell's novel of *Sylvia's Lovers*, ch. ii. These market-crosses were often "polygonal buildings with an open archway on each of the sides, and vaulted within, large enough to afford shelter to a considerable number of persons; of these good examples remain at Malmesbury, Salisbury, Chichester, Glastonbury, etc." (Parker, *Concise Glossary of Architecture, s.v.* "Cross"). In more

recent times market halls have been generally erected by municipalities, though the market women can by no means always be induced to pay for the privilege of shelter.

There has of late been an animated discussion among German scholars as to the part played by the market in the growth of the municipal constitution. A summary of the evidence and arguments on one side will be found in L. Goldschmidt, *Universalgeschichte des Handelsrechts* (vol. i. of his *Handbuch des H.*, 1891), pp. 126 *seq.*, who goes so far as to say "The town tribunal is originally and essentially the market tribunal, the town itself a market, the town peace a market peace." For the keenest criticism of this view, see G. von Below, *Der Ursprung der deutschen Stadtverfassung* (1892).] W. J. A.

MARKET (on the stock exchange). The stock exchange is a remarkable case of development of the original meaning of a "market." Within the stock exchange the consol market, the home railway market, the foreign stock market, the American market, the miscellaneous market, the mining market, with its off-shoot the "Kaffir" market for South African shares, —each is spoken of as an assemblage of dealers standing ready to buy or sell the various stocks and shares indicated by the titles of their respective markets. Outside the stock exchange a market is not so regarded. A person wishing to buy or sell sends in his broker to inquire as to "the state of the market" in consols, or American shares, or mining shares, as the case may be. The broker goes to the dealers, knowing exactly where to find his men, and gets their quotations of price and tendency, and, what is important, he has the opportunity to examine the prices "marked"—on a board provided for the purpose—at which previous business had been done. Thus it is possible to get at once the record of price and the personal opinions of competitive dealers, both being elements of a market. Further, the quotations of price which the dealer gives are not simply an expression of opinion; if he quotes a price for a given amount of stock or quantity of shares, he must deal. For example, if the dealer quotes 90 to 90¼ for a specified quantity of Italian bonds of £100 each, he must take them at £90, or sell them at £90 : 5s. Nothing could be a more definite quotation, a more exact reflection of the actual state of the market. There is little possibility of picking up stock cheaply, as a connoisseur could pick up a fine old Italian violin from some ignorant villager; on the other hand, there is little risk of fraud upon an ignorant seller. The member of the stock exchange who attempted to cheat an outside seller, or his broker, would be subject to the severest censure from the committee for general purposes (see EXCHANGE, STOCK), and would be sent to Coventry by the more scrupulous of his colleagues. Nothing, then, could be a more complete instance of a market than is given by the stock exchange. We get records or markings, the opinion of a concourse of dealers, competition, and a check upon dishonest dealing.

[For defin. of market, Jevons's *Theory of Pol. Econ.*, ch. iv.; *Theory of Exchange*. Also Cournot, *Recherches, etc.*, 1838, p. 55 n.—Giffen, *Stock Ex. Speculation*. See Art. HIGGLING OF THE MARKET.] A. E.

MARKET OVERT. The law of market overt constitutes a fitful and illogical application to English law of the French maxim "en fait de meubles, possession vaut titre." The general rule in England is that no one by transferring goods to another can give a better title than he himself possesses. But when a person in good faith buys goods in "open market" and according to the usages of the market, he acquires a good title to them, in spite of any want of title in the seller. The rule only applies to ancient, and not to modern statutory markets. All sales by shopkeepers in the city of London, when the goods themselves are in the shop, are by custom sales in market overt, but the custom does not extend beyond the city limits. Hence if a stolen watch be sold in Fleet Street, the buyer may get a good title to it, while he gets no title to it if he buys it in the Strand. Wholesale mercantile transactions, it may be noted, are to a great extent protected by the Factors Act, 1889.

MARKET VALUE. See VALUE.

MARKETS AND FAIRS. See FAIRS AND MARKETS.

MARKKA (Finland). The metallic currency of Finland consists of the following coins (imperial decree of 8th November 1865):

Denomination.	Weight grammes.	Millesimal Fineness.	Intrinsic Value.	
			English Standard. Gold: £3:17:10½ per oz., 916·6 fine. Silver: 5s. 6d. per oz., 925 fine.	French Standard. Gold francs, 900 fine. Silver francs, 900 fine.
Gold—			s. d.	francs.
20 markka	6·452	900	15 : 10½	20
10 "	3·226	900	7 : 11·125	10
Silver—				
2 markka	10·365	868	1 : 8½	1·99
markka	5·182	868	10½	·90
50 penni[1]	2·549	750	4½	·42
25 "	1·274	750	2	·21

There are also bronze coins of the nominal value of 10, 5, and 1 penni.

The standard gold markka (not a coin) is the

[1] The piece of money which, reckoned in French standard silver francs, is only worth ·42 franc, is in reality a token coin passing as the half of a *gold* standard markka.

equivalent of the gold franc, that is to say, about 9½d., or 25·22=£1, the penni being of the same nominal value therefore as the French centime. F. E. A.

MARLO, KARL. This was the pseudonym under which Karl Georg WINKELBLECH (1810-1865) published his economic writings. Winkelblech was born at Ensheim, near Mainz, studied physics and chemistry at Giessen—the latter under Liebig—became *privat-docent* at Marburg in 1837, and in 1843 was appointed professor of chemistry in the higher trade-school at Cassel. In early life he showed strong literary tastes, carrying about with him habitually a volume of Goethe, Schiller, or Lessing. The impulse which made him an economist came from a German workman whom he met during a journey in Sweden undertaken for technical objects. This casual companion drew so vivid a picture of the sufferings of the class to which he belonged that Winkelblech resolved to devote for the future his most earnest studies to the condition of the workers, rather than, as previously, to the instruments and processes of industry.

His principal work, which remained unfinished at his death, is *Untersuchungen über die Organisation der Arbeit, oder System der Weltökonomie*, 3 vols., 1850-59. It produced little effect in Germany, perhaps—as Lippert suggests—in consequence of the social discouragement and apathy then prevailing. It was highly praised by Schäffle in his *Kapitalismus und Socialismus* (1870), and the attention thus drawn to it led to the publication, in 1884-86, of a posthumous second edition, enlarged and containing a biographical sketch of the author.

The book opens with a history and criticism of the progressive life of the most important civilised nations—France, England, the United States of America, and Germany, and a study of their comparative ripeness for what he regards as a necessary transformation of the basis on which their economic systems rest. The tendency of modern changes in the industrial sphere had been to abolish the smaller capitalists, and to create a great mass of *prolétaires*, who can never hope to attain social independence, and whose wages will never suffice for much more than to sustain their lives. Employment, too, has become uncertain, and the increased division of labour has made work monotonous and uninteresting. The working classes do not enjoy any true domestic life; wives and mothers spend their days in factories, and cannot superintend their families; and morality suffers from the employment of the younger women in manufactures. The physical condition of these classes is deplorable, their dwellings are overcrowded, their food is insufficient, and drunkenness, improvidence, and a spirit of revolt are the necessary results of their entire position. The modern *prolétaire* is the successor of the ancient slave and the mediæval serf; and it may be doubted whether he is more advantageously situated than those who had at least an assured existence. This is, it will be seen, the picture habitually drawn by the socialists, in which the dark side of our industrial life alone appears. But it is real enough in many of its features to make us ask anxiously for the remedies which the author suggests.

According to his view of economic history, there have successively prevailed two different ideas of right, which he calls the Pagan and the Christian respectively. Under the reign of the former it was regarded as natural and legitimate that the masses should be sacrificed to ensure enjoyment and splendour to the few; whilst the Christian idea asserts the equality of all, and requires that each member of the community should have a share of the produce of the social labour proportional to his useful participation in the work. The former principle, to which he gives the name of *Monopolismus*, is represented by ancient slavery,—and its later modifications, serfdom and forced labour,—and continued to reign down to the French Revolution. The Christian principle, though accepted by the general conscience, has as yet only partially influenced practice; privileges, monopolies, and gambling speculation still exist, sometimes in aggravated forms. Two efforts have been made to realise the new principle—Liberalism, aiming at universal liberty, and Communism, aspiring after a *régime* of equality. But both these systems are one-sided and erroneous. Liberalism, based on the merely negative idea of unlimited competition, after demolishing the old privileges, has become the parent of plutocracy, whilst communism, distributing products according to wants, not services, and so weakening the motives to exertion, would infallibly beget indolence. These opposing systems he sought to reconcile, and to unite true liberty with true equality by the establishment of a *panpolismus*, the aim of which would be to raise to the highest attainable level the self-development and legitimate life-enjoyment of all the members of the community. Under this *régime* the obligation to labour will be universal, every one will have a right of access to the means of production, and will be supplied with work, and each will obtain for his personal use the entire amount of his contribution to the common stock. The state will take into its hands not only railways and roads, postal communication, water-supply, banks, and educational institutions, but also forestry, mining, fisheries, and trade—so far as it has to do with such raw products or manufactures as are fitted for exhibition and sale in warehouses. Under private management will be agriculture, cattle-rearing, and trade and transport in the narrower sense; but these occupations will be carried on not by independent speculators, but by guilds or industrial societies (*Zünfte*), organised by the state. Existing capitals in the possession of individuals at the instalment of the new system will not be interfered with; but its operation will prevent their subsequent increase. The instruments of production will be common property, but the instruments of enjoyment—the fruits of industry—will be the property of individuals. Foreign competition will be limited by protective duties. Winkelblech admits that his own, like every other social plan, must fail, if provision is not made against an undue multiplication of the workers. "Whoever," he says, "promises to the people to

rescue them from wretchedness without setting himself against over-population, excites expectation which can never be realised, and should be looked upon as a dangerous demagogue." Adopting the theory of MALTHUS, Winkelblech regards the practical safeguards proposed by its author as altogether insufficient. Agreeing with him in advocating the suppression of a state provision for the destitute, he would go farther, and would enforce by law the abstinence from marriage in certain cases, which his predecessor only contemplated recommending as a moral duty. He would make it obligatory upon every member of his societary system to contribute to an assurance fund against the consequences of age, sickness, or misfortune, and for the maintenance of the widow and orphans he might leave at his death. No one should be permitted to marry until he could show that he had sufficient means to guarantee his payments to such a fund, and additions should be made to this "marriage capital" according to the number of his children. Such individual cases of distress as might continue to exist under the new order of things would be left to be dealt with by private beneficence.

ROSCHER speaks of Winkelblech as one of the most solid (*gründlich*), moderate, and conscientious of the socialists, and he appears to deserve that description. He took no part in political agitation, but maintained throughout the attitude of a thinker. His denunciations of the existing economic system were dictated, not by class-hatred but by genuine sympathy with the working people. But he expected too much from his new social order, even if it were possible to establish it. As Cossa remarks, whilst he saw clearly the difficulties which every form of socialism has to encounter in its almost certain results of insufficient production, excessive consumption, and the stimulus to an indefinite increase of population, he had at the same time a very undue degree of confidence in the precautions he suggests against those dangers.

[Lippert in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 1021—Cossa, *Introd. to the Study of P. E.*, p. 539.—Rae, *Contemporary Socialism*, ch. ii.—W. H. Dawson, *German Socialism*, p. 48.] J. K. I.

MARMONTEL, JEAN FRANÇOIS (1723-1799), a distinguished 18th-century prose and verse writer.

Voltaire encouraged him to produce plays for the stage, and by the favour of Madame de Pompadour, he was appointed clerk of public buildings. In 1763 he entered the Academy, to which he became Perpetual Secretary. He was a member both of the electoral assembly of 1789 and of 1797, but was degraded for his moderation. His connection with political economy lies mainly but not entirely in the fact of the emotional interest the perusal of his *Mémoires* excited in the mind of J. S. Mill, at a very critical stage of that writer's career. His *Mémoires* have allusions to QUESNAY and other matter of economic interest.

[Mill's *Autobiography*, p. 140, ascribing to the experiences of this period "marked effects on my opinions and character"; also see Cossa, *Introd. to the Study of Pol. Econ.*, translated by L. Dyer, London, 1893, p. 331.—Marmontel's *Works* in 32 volumes, were published in 1787, 8vo.] A. L.

MAROGNA, CONTE GIAN GIUSEPPE (18th century), born in Verona; wrote on trade corporations for the prize competition offered for this subject by the academy of Verona, 1789 (see MARACHIO).

Marogna holds an intermediate place between the advocates of free labour and the supporters of old restrictions; he shows the disadvantages of some of the trade corporations, and suggests their partial abolition. Desiring to promote the improvement of manufactures, he suggested the uniting in trade corporations only those crafts which required skill and intelligence, leaving the rest free, and suppressing the corporations of merchants and dealers. For these latter, rather than for those of artizans, he fears the injurious effect of monopoly. Though Marogna advocates abolishing the corporations of merchants, he does not support free trade, but, on the contrary, recommends state interference in determining prices.

Sul governo delle arti-ragionamento, Verona, Moroni, 1792. [G. Alberti, *Le corporazioni d'arti e mestieri, e la libertà del commercio negli antichi economisti italiani*, Milan, 1889.] U. R.

MARPERGER, PAUL JACOB (1656-1730), was originally a merchant, before he entered the Danish and the Prussian civil services. At the time of his death he was an aulic and commercial councillor in Dresden.

Until the middle of the last century Marperger enjoyed a great reputation in Germany as being "perhaps the most distinguished supporter of cameralistic science," and "almost the only German author on trade." He was an inexhaustible writer on commercial subjects; his book on Banks (1716) is best known. Roscher is very severe on Marperger, and considers him as having simply diluted anterior publications and added to them some very trite moral sentiments (*Gesch. der. Nat. Oek.*, pp. 301-302). E. ca.

MARQUE, LETTERS OF. This term is derived from the mediæval Latin word *marcha*, a frontier, a letter of marque being a licence granted by a sovereign to a subject who has sustained wrong and been denied justice in a foreign state, to cross the frontiers and execute reprisals, that is, recover his property or seize an equivalent by way of compensation. Hence the full phrase is "letters of marque and reprisal." The fundamental idea, which was borrowed from the Roman law, was that nations formed a *societas* or partnership, with the customary incident of unlimited mutual liability. So far as the individuals were concerned upon whom such reprisals were taken, it was argued by the mediæval civilians that they could obtain indemnity from their countrymen, members of the same "societas"; whilst between them and the foreigner no such tie existed. Letters of marque

were granted by John and Edward III. The earliest case mentioned by Ducange is in a charter granted by James, king of Aragon, in 1326. In the black book of the Admiralty, I. 385, is a complaint laid by a merchant of Danzig in 1409 against Henry IV.'s step-son, John, Duke of Brittany, and his subjects for the plunder of his ship. He was granted letters patent to seize Breton ships and goods in Irish waters to the amount of his loss, "nomine distrucçionis vocate marquæ." The peculiarity of this case is that the grantee was an alien who claimed as being in amity with England. In 1416 a statute was passed reciting the wrongs and injuries sustained by English subjects at sea, and empowering the lord chancellor, where justice was denied to letters of request, to grant letters of marque (4 Hen. V. st. 2, c. 7). Such letters were not regarded as a breach of the peace. They were issued not only on behalf of individuals but of particular towns, as in 1487 by the emperor on behalf of Cologne against Scotland (Macph. I. 707). The feeling grew up in the 15th century that they were incompatible with treaties of peace, and Henry VII. remonstrated at their issue against the English by Ferdinand and Isabella in 1488. (*S. P.*, Sp. 17, p. 4; 21, p. 12; 34, p. 22, etc.). But numerous instances occur during the reign of Henry VIII. in which this practice continued. (*S. P.*, Dom. Hen. VIII. III. 2224. Acts Priv. Counc., I. 107, 108, etc.).

A limitation was, however, introduced into treaties, as into that between England and France on 7th August 1514, binding the sovereigns on either side only to issue "letters of reprisals, marque, or counter-marque" against principal delinquents and then only in case of denial of justice. (Rym. *Foed.* Hague ed. VI. i. 65). An example of such letters is given in Molloy, I. 46, dated 17 Car. II. Such letters of marque are now disused, and the term "letters of marque" is applied to commissions issued in time of war by the lords of the admiralty in conformity with various acts of parliament to owners of merchant vessels, called privateers, allowing them to capture ships of the enemy and to divide the prizes, which would otherwise belong to the crown. During the Crimean War the allied powers issued no letters of marque. By the Declaration of the Conference of Paris in 1856 privateering was abolished so far as the contracting powers were concerned. These were Great Britain, France, Austria, Russia, Prussia, Sardinia, and Turkey. Spain, Mexico, Venezuela, and the United States have refused assent to this agreement.

[Ducange, *Glossar.*—Molloy, *De Jure Maritimo*, 1769. — Blackstone, *Commentaries.* — Halleck, *International Law*, London, 1893.] I. S. L.

MARRIAGE (FEUDAL SYSTEM). The lords of tenants by knight's service had the right of bestowing in marriage their female wards while under age. This right, which was probably of gradual growth, makes its appearance as settled law about the 11th century. Its operation was soon extended, and a gift by the king, of a widow, in marriage, and her lands, is recorded in Domesday (Ellis, i. 337). It was required that the match should be, as Blackstone says, without "disparagement or inequality," and that the king's license should be given. This was to avoid marriages to the king's enemies. The right was afterwards extended to the case of male wards. If the infant refused to obey, he or she forfeited the value of the marriage, that is the sum actual or assessed which the guardian could have received for it. Marriage without the guardian's consent entailed a double forfeit. The right was only valuable in the case of the children of tenants by knight's service, for though, as Littleton states, it was in a sense also an incident of socage tenure, the *valor maritagii* did not in that case belong to the guardian—who was not an overlord, but was the person nearest of kin to the ward who was not in the line of inheritance. The MERCHET, or fine, for permission to manorial tenants of the villein class, and sometimes even to the freeholders, to marry was a minor source of revenue to the lord; but it was totally different in origin from the feudal right. Henry I. by his charter of 1101 declared the right abolished, but his decree was inoperative in this respect. It reveals incidentally that widows as well as children of the king's barons, and *homines* were, as stated above, liable to the oppression, and that the barons claimed the same right over their own tenants by knight's service. The *Rotuli de dominabus et pueris et puellis de donatione regis*, drawn up in the 31st year of Henry II., gives a list of widows, their ages, children, and lands, thus showing the system in full operation. A special condition as to heirs, and the abolition of the right over widows, was granted by Magna Charta, but the sale of wards is recognised by the statute of Merton (20 Hen. III. c. 6), and the Hundred Rolls (*temp.* Edw. I.) include a return as to marriages and wardships. The whole system became intolerably oppressive in the 16th and 17th centuries, and was finally abolished by statute, 12 Car. II. c. 24. A vast bulk of original documents respecting wards and minors down to the time of the act exists in the Public Record Office (see MARITAGIUM and WARDS).

[*Fleta*, bk. i. c. 13; bk. iii. c. 11.—*Bracton*, ii. pp. 2-46 (Rolls ed.).—S. H.

MARRIAGE-RATE may be defined as the ratio between the number of persons belonging to a certain population who marry in a year, or other unit of time, and the number of the population. This is the sense in which the term is used in the English registrar-general's tables. In other countries the number of marriages, not of persons married, is often used as the numerator of the fraction which forms the marriage-rate. It has been proposed to use for the denominator not the entire population, but only the marriageable part of it. Some international statistics of this "specific" marriage-rate are given by Bertillon in his masterly discussion of "Matrimonialité," in the *Annales de Demographie Internationale*, vol. i. p. 20.

The definition of marriage-rate presents a difficulty which has been met in the case of other rates, viz. that the population cannot be supposed constant during so long a period as a year. This difficulty might be serious if the population were very small, especially in a peculiar case mentioned by Prof. Westergaard, (in the *Revue d'Économie Politique* for May-June, 1891, p. 443), where the occurrence of a marriage tends to diminish the population under consideration, namely, the persons belonging to a certain occupation, which is usually abandoned on marriage.

The marriage-rate acts through the birth-rate on the increase of population. How indirect is this action appears by observing that in countries which have a particularly small natural increase, *e.g.* France and Massachusetts (·16 and ·65 per cent respectively, for the period 1865-1883, while the average for Europe is 1·06), the marriage-rate is either not particularly small (in France ·78 marriages per 100 living compared with ·83 for Europe), or even particularly large (in Massachusetts ·94 marriages per 100 living). For the number of the children to a marriage is particularly low in these countries (Marshall, *Principles of Economics*, note to ch. iv. bk. iv.).

Among the causes of variations in the marriage-rate, vicissitudes in material prosperity are prominent. Dr. Farr, surveying the ups and downs of the marriage-rate in England for nearly forty years, assigns an external cause for each fluctuation, now the influx of Australian gold in the year of the great exhibition, now a commercial panic, or the Crimean, or even the Abyssinian war. A similar explanation is attempted by Dr. Bertillon in the publication above referred to. The price of the principal article of food is a main factor under this head; especially where the population is poor and near the brink of subsistence. The connection between the price of grain and the frequency of marriage is apparent in the statistics of Sweden and other continental countries[1] (cp. Sir Rawson Rawson, *Statistical Journal*, 1885, Quetelet, *loc. cit.* and most of the general treatises on statistics). In more advanced countries commercial crises and the state of international trade have at least as much effect as variations in the price of wheat on the marriage-rate. In England a fall in the marriage-rate has often been accompanied by a fall in the price of wheat (Dr. Ogle, *Journal of the Statistical Society*, vol. liii. (1890), p. 258). "The statistics even seem to suggest," says Prof. Marshall, "that this is not a casual coincidence," and he suggests an interesting explanation of the paradox (*Principles of Economics*, bk. iv. ch. 4, § 7).

It may happen that though wealth increases, yet the standard of comfort increasing more quickly, the marriage-rate declines. This may be in part the explanation of the decline in marriage-rate which has occurred in recent years in many civilised countries [see Sir Rawson Rawson's *International Statistics*, p. 521, also *Movimento dello Stato Civile: Confronti Internazionali*, 1865-83, Tavola I. *bis*; and *Bulletin de l'Institut International de Statistique*, Table I., *bis*].

As another cause of variation in marriage-rates may be mentioned the different proportions of persons at each age in different populations. The manner in which the frequency of marriage varies with age is strikingly shown by a *stereogram* due to the Italian Statistical Museum, of which there is a copy in the rooms of the London Royal Statistical Society, an explanation in the society's jubilee volume, 1885, p. 247, and a criticism in the Journal for March 1894 (cp. Quetelet, *Physique Sociale*, vol. i. p. 275 and context).

Difference of season is also a cause of variation of marriage-rates, referred to periods shorter than a year. The deterrent influence of Lent is marked in Roman Catholic countries. A minimum in the month of March is matched in the adjacent months by maximum—or at least large—numbers of marriages displaced, as it were, from their natural position. On this head Quetelet well says: "Les lois naturelles ne sont point totalement effacées sans doute, mais il est difficile de saisir leurs effets au milieu des lois religieuses et des habitudes civiles." (*Physique Sociale*, vol. i. p. 261.)

The delicacy with which marriage-rates thus respond to the action of assignable causes is not inconsistent with the peculiar constancy which has been attributed to these statistics. The oscillations are not only precise, but also minute as compared with other coefficients in vital statistics—in particular with death-rates. This contrast is well shown by the diagram in Dr. Longstaff's *Studies in Statistics*, which presents the variation of the two rates from year to year in England. That of the two rates the one which depends more upon human volition should be the steadier is a circumstance deserv-

[1] See diagram, *Marriage-rate and price of rye in Prussia compared*, in art. on GRAPHIC METHOD.

ing the attention which it has received from Quetelet (*loc. cit.*) and others. It may be ranked with the stability of the numbers of suicides as one of the wonders of moral statistics. It is not unreasonably used as proof that the reign of law extends over the domain of volition. (Cp. Mill, *Principles of Logic*, bk. vi. ch. ii.—Venn, *Logic of Chance*.)

[In addition to the works cited in this article the general treatises referred to in the article on DEATH-RATE should be consulted.] F. Y. E.

MARRIAGE SETTLEMENT (also called ante-nuptial settlement), a settlement made, in contemplation of marriage, of funds respectively contributed by the intending husband and wife or their respective relatives or friends. The usual trusts of such settlements are: to pay the income of the husband's fund to the husband for life and the income of the wife's fund to the wife for life; after the death of either of them to pay the whole income to the survivor for life or until remarriage; after such death or remarriage to divide the fund among the children or issue of the marriage in such shares as the husband and wife or the survivor shall have appointed, and in default of appointment among the children of the marriage who shall attain the age of 21 years or, being daughters, marry under that age.

A marriage settlement, not being considered a voluntary settlement, is not defeasible in the settlor's bankruptcy.

One of the reasons which brought marriage settlements into general use, viz. the extensive rights which the law gave to a husband over his wife's property, has been removed by the Married Women's Property Act 1882 and the amending Acts, but the custom to have marriage settlements has remained unchanged.

No doubt the desire on the part of the friends of persons who are about to marry to secure an adequate and indefeasible provision for the intending husband and wife and their children is justifiable, but the practice of settling property, on marriage or otherwise, cannot, on the whole, be considered advantageous to the community. In the first place it diverts a considerable amount of capital from trade and industrial enterprise, and creates an artificial demand for so-called trustees' securities—thereby unduly increasing the facilities for borrowing of a special class of companies and public bodies. But its principal disadvantage is the fact that the persons concerned—knowing that in any event they can rely on a comfortable income—are less inclined to resist any temptation leading them to extravagance or recklessness. A system which allows a large number of persons to enjoy every comfort and luxury while their creditors must be satisfied with a small dividend on their claims, should not be encouraged by the law. If it were made illegal to impose any restraints on anticipated dealings with income, a great part of the mischief would be avoided. As the law stands, restraints on anticipation in express terms are invalid, except in the case of married women, but the ingenuity of draftsmen has overcome this difficulty by the insertion of clauses in many settlements declaring that the income is to be forfeited on any attempted alienation or on bankruptcy, and that on such forfeiture it is to be applied by the trustees for the benefit of the person to whom it originally belonged in his or her family. In this way the enjoyment of the income is virtually retained, and it is only the creditors who suffer by the forfeiture.

Marriage settlements like other settlements have always been subject to succession duty, and, when the interest of any successor exceeded £10,000, to Mr. Goschen's estate duty, of 1 per cent, and now they are subject to Sir William Harcourt's graduated estate duty. E. S.

MARRIED WOMEN IN FACTORIES. See FEMALE LABOUR.

MARSHALL, WILLIAM (1745-1818), was one of the few really noteworthy English writers on agriculture; to the student of agrarian development his works are probably quite as valuable as those of his contemporary and rival Arthur YOUNG, though their style and arrangement prevented their obtaining the same popularity. He came of farmer stock in the North Riding, and began his long series of agricultural experiments, and of treatises describing them, in 1774. His most important works fall into two groups. First come the twelve volumes in six pairs, describing the *Rural Economy* of Norfolk (1787), Yorkshire (1788), Gloucestershire (1789), the Midland Counties (1790), the West of England (1796), and the Southern Counties (1798), respectively. In these he carried out the *Plan* he had submitted to the Society of Arts in 1780; that is to say, he resided for a year or more, sometimes acting as agent or manager of estates, in one district after another, "minutely registering the provincial practice." Some time before, "in a journey of four or five hundred miles through the central parts of the Island, I experienced the inutility of a *transient view*,"—a thrust at the contemporary *Tours* of Arthur Young. The new Board of Agriculture and its secretary, Young, found in him an indefatigable critic; and the *Reports* or *Surveys* drawn up under its authority occasioned a second series of volumes from Marshall's pen. To show how much better he could arrange the material, he drew up in five volumes *A Review and Complete Account of the Reports to the Board of Agriculture* for the Northern (1808), Western (1810), Eastern (1811), Midland (1815), and Southern and Peninsular (1817) "departments," respectively. In 1808 he retired to an estate he had purchased on the vale of Cleveland, and died

there, while busy upon the construction of a building at Pickering for his proposed rural institute or college of agriculture.

[A list of his other works will be found in John Donaldson's *Agricultural Biography* (1854). Perhaps the most important of them are *Minutes of Agriculture, made on a farm of 300 acres of various soils, near Croydon, Surrey* (1778).—*Planting and Rural Ornament* (1796).—*On the Appropriation and Enclosure of commonable and intermixed lands* (1801).—*A Treatise on the Landed Property of England* (1806).] W. J. A.

MARTIN, Frederick (1830-1883), started in 1864 that useful publication *The Statesman's Year Book*, and edited it until the December of 1882.

Among his works are :—*Commercial Handbook of France*, London, 1867, 8vo.—*The History of Lloyd's and of Marine Insurance*, London, 1870, 8vo.

[*Dictionary of National Biography*, vol. xxxvi., p. 275.] H. E. E.

MARTIN, Robert Montgomery (1803-1868), historical writer and statistician, is said to have been born at Tyrone, Ireland. He studied medicine, but apparently never practised. In 1820 he visited Ceylon, and thence travelled to the Cape of Good Hope, Australia, and India. From 1831, when he completed his *History of the British Colonies*, to 1844, he lived in England, taking a great interest in colonial trade questions, and devoting an untiring energy to the compilation of statistics. He gave evidence before the committee on the China trade. In 1844, he was appointed treasurer of Hong-Kong, but did not succeed in that capacity. Soon returning to England, he gave himself up once more to statistical research.

His chief works, apart from his *History of the Colonies*, were :—*Ireland before and since the Union*, 1844.—*Political, Commercial, and Financial Condition of the Anglo-Eastern Empire*, London, 1832.—*Analysis of the Parliamentary Evidence on the China trade*, 1832.—*Ireland as it was, and ought to be*, 1833.—*Poor law of Ireland*, 1833.—*Taxation of the British Empire*, 1834.—*Statistics of the British Colonies*, 1839.—*Monetary System of British India*, 1841. In 1848 he republished his two works on Ireland under the title *Ireland as it Was, Is, and Ought to Be*, in order to show that "no greater evil could befall Ireland than a disunion of the solemn legislative compact of 1801." [*Dictionary of National Biography*.] C. A. H.

MARTINEAU, Harriet (1802-1876), became first famous through the publication of *Illustrations of Political Economy*, 18 vols. in 9, London, 1832-34, 16mo ; the form of which was suggested by Mrs. Marcet's *Conversations on Political Economy*. In the curious autobiographical notice left behind for the *Daily News*, she wrote, "The original idea of exhibiting the great laws of society by a series of pictures of selected social action was a fortunate one ; and her tales initiated a multitude of minds into the conception of what political economy is, and of how it concerns everybody living in society. Beyond this there is no merit of a high order in the work. It did not pretend to offer discoveries or elucidations of prior discoveries. It popularised in a fresh form some doctrines and many truths long before made public by others." Difficult as it may be to a generation which has been taught that *les dénoûments ne sont pas des conclusions* to credit it, the success of these tales was extraordinary. Within a few years their circulation reached to 10,000. Cabinet ministers, newspaper editors, and politicians appear to have vied for the privilege of having their proposals supported by the stories. A further series, *Poor Laws and Paupers illustrated*, 4 vols. in 2, London, 1833-34, 16mo, was undertaken at the suggestion of Lord Brougham. *Illustrations of Taxation*, 2 pts. 1834, 12mo, completed this branch of Miss Martineau's work. In her *History of the Thirty Years' Peace, 1815-1846*, 1849, 8vo, 2 vols., however, and in her *British Rule in India*, London, 1857, 8vo, considerable attention is given to the economic aspects of history. Her views on economic questions underwent great alterations. At first a "strict Benthamite," and adherent of the classical political economy, her American experiences considerably modified her views on the subject of property. She was led to expect further changes "which will probably work out in time a totally new social state," wherein the ideals of R. Owen (*q.v.*) would to some extent be fulfilled. Her breach with the old orthodox political economy was no doubt widened by the positivist influences under which she came.

[*Harriet Martineau's Autobiography, with Memorial by M. W. Chapman*, 3 vols. 1877, 8vo.—*Dictionary of National Biography*, vol. xxxvi. p. 309.] H. E. E.

MARTINEZ DE LA MATA, Francisco (middle of the 17th century). The author describes himself as a brother of the order of penitents and servant of the afflicted poor, on the title of his *Memoriales ó Discursos en razon del remedio de la despoblacion, pobreza y esterilidad de España*, which were published about 1650, and reprinted by Campomanes (*q.v.*) in his *Apéndice á la Educacion Popular*, vol. i., Madrid, 1775. Some extracts will also be found in Sempere y Guarinos, *Bib. Ec. Pol.*, vol. iii., Madrid, 1804. Martinez de la Mata is a fervent representative of the later form of mercantilism : "Kingdoms and republics flourish by the manufacturing and traffick of the produce of industry, tillage, and breeding ; these reciprocally assist each other, but the *principal* nerve is manufactures (*artes*), which increase the population. . . . Labourers only bring into existence the fruits of the soil and leave them in the state in which nature supplies them ; as long as they remain thus their value is

low, but this multiplies even a hundredfold when they are handed over to manufacturers," p. 3.

"France, Genoa, Venice, Florence, Holland, and England, have grown rich through the permission given to the subjects of Spain to consume their merchandise. . . . This is how they became deluged with gold and silver," p. 7.

He gives the list of the crafts (*gremios*) which had disappeared, p. 31; complains of the introduction of 120,000 foreigners, p. 130; describes, with many particulars, the professions which the latter had acquired, pp. 134 *seq.*; and gives details on the decline of some branches of industry, such as gloves in Ocaña, p. 252, and hosiery in Toledo, p. 261.

[Colmeiro, *Biblioteca de Economistas Españoles*, p. 115.] E. ca.

MARULLI, Vicenzo (18th century), a Neapolitan; one of the many Italian writers who in the 18th and beginning of the 19th century wrote on charity organisation then engrossing the attention of governments, and the labours of the studious. Marulli's work, like others, owed its origin to the inquiry made by the Neapolitan government in 1802, as to "the best means of maintaining and employing the poor of the kingdom of Naples and in the houses of correction." Marulli objects to begging, and would suppress it; he advises poor relief being carefully regulated in order that poverty may not be increased by it. He advocates establishing asylums, hospitals, etc., and especially a good organisation of public charity in order to avoid the disadvantages and incitement to idleness often arising from indiscriminate private charity. Begging can only be strictly forbidden when well-organised systems of charitable relief are established to meet the wants of the poor.

Ragionamento sulla mendicità, Naples, Stamperia Simoniana, 1804.

[Fornari, *Delle teorie economiche nelle provincie napoletane*, vol. ii., Milan, 1888.] U. R.

MARX, Heinrich Karl (1818-1883), distinguished as a socialistic theorist and agitator, was born at Trier. His father, who with his family passed in 1824 from Judaism to Protestantism, was a legal official. After receiving instruction at the gymnasium of his native place, Marx studied from the year 1835, first jurisprudence, then philosophy, at Bonn and Berlin. He settled at Bonn with the view of becoming a docent in the university. But his friend Bruno Bauer's difficulties with the government, arising from his theological views, convinced Marx that he too would find it difficult to maintain an academic position under Prussian rule. He and Bauer began, in 1842, at Cologne, the publication of the *Rheinische Zeitung* in the interest of the radical opposition. Towards the end of the same year Marx undertook the management of the journal, and removed from Bonn to Cologne. The government forbade the continuance of the paper from 1st January 1843; and Marx, accompanied by Arnold Ruge, now went to Paris, having first married a young German lady to whom he had been for years betrothed. He and Ruge entered on a joint journalistic enterprise, which, however, speedily came to an end, partly from a difference of principles between the two associates. Ruge attached himself to the Hegelian philosophy and political radicalism; Marx studied economics, and through the influence of French writers, notably Proudhon, became a socialist. In 1844 began the relation between Marx and F. Engels, which terminated only with the death of the former. Marx took part in producing a weekly journal published in Paris with the title *Vorwärts*, which covered with ridicule the absolutism and sham constitutionalism of the German princes. The Prussian government applied to the Guizot ministry for the expulsion of Marx from France, which was granted; and accordingly, at the beginning of 1848, he removed to Brussels, where he was joined by Engels. The two friends prepared, January 1848, the manifesto of the communist party at the request of a secret propagandist league; many German editions of this document have since appeared, and it has been translated into most of the European languages. The February revolution having broken out, Marx was expelled from Belgium, and at the invitation of the provisional government of the French republic, returned to Paris. He went to Cologne in the same year, and set on foot the *Neue Rheinische Zeitung;* among the contributors to this journal was Lassalle. After having been twice before the courts of law for advising resistance to the government, Marx was expelled from Prussia. Retiring to France, he was forced to quit that country also, and fixed his permanent residence in London. During the following years he wrote much on current politics, and was the English correspondent of the *New York Times*. The first-fruits of his long-continued economic studies appeared in his *Zur Kritik der politischen Oekonomie*, pt. i., 1859. But, finding himself not yet in a condition to develop the consequences of his fundamental principles, he discontinued this work, and, returning to his studies, embodied his views finally in *Das Kapital*, of which the first book was published 1867, the second was edited after the death of the author by Engels 1885. The third part appeared in 1894.

In 1864 the International Association was founded, and Marx early took a leading part in its proceedings. His plan of a body of statutes and his inaugural address were preferred to those of Mazzini, which were put in competition with them; and thus he became the chief of the organisation, and wrote all the documents issued by the general council. The watchword

of the party now became "Proletariate of all countries, unite." The fall of the French commune made the maintenance of the International in Europe impossible; the anarchists created internal discussions in the body; and the general council was transferred to New York. Marx now devoted himself diligently to the extensive studies required for the completion of his treatise, learning—it is said—with a view to this, the Old Slavonic, Russian, and Servian languages; he continued, however, to exercise great influence by correspondence and personal interviews with the socialist leaders in different countries. But his failing health increasingly impeded his work; and after the loss of his wife and of his eldest daughter, he died, sitting in his arm-chair. He was buried in Highgate cemetery.

The characteristic features of Marx's system are his view of the nature of capitalistic production, and his materialistic theory of history. According to him labour alone creates value, and the value of a commodity is measured by the quantity of labour which is socially, *i.e.* normally, necessary for its production. In existing society, the instruments of production are in comparatively few private hands. The other members of the community have nothing but their labour-power to sell. This is bought by the capitalist; but, even when he pays its market-price, he does not pay its full value; he appropriates to himself a portion of the product of the workman's labour, the whole of which ought to go to the workman; and what is so appropriated, called by Marx the *surplus-value* (*Mehrwerth*), is the source of the capitalist's income. A value equivalent to the workman's subsistence, or, in other words, to the wages actually paid him, would be produced in a small number of hours; but he is forced to work longer for those wages, and the product of this additional work, the surplus-value, goes into the capitalist's pocket, though he has no right to it. Hence, the effort of the capitalist to lengthen the working day, and of the workman to shorten it; and in this struggle, so long as it is a purely economic one, the weaker—the workman—goes to the wall. When the capital embarked in a successful enterprise is increased, the surplus-value, as a whole, is enhanced; and, as the productivity of labour rises with the progress of society, and as the workman's subsistence is thus supplied by a shorter labour-time, again the surplus-value is increased. Accordingly the tendency of the industrial world is to the development of industry on the great scale, and to the ever greater use of machinery; and the increased division of labour, thus rendered possible, leads to the employment of women and children in manufactures—a new exploitation of the working-classes for the advantage of the capitalist, which also depresses the wages of men. An intense war of competition goes on between different capitalists, and, whilst there is perfect organisation within the individual factory, there is anarchy in social industry, regarded as a whole, which results in periodically recurring crises. The changing proportions of "constant" and "variable" capital, *i.e.* of the permanent instruments of production on the one hand, and labour-power on the other, leads to fluctuations in the movement of population; and the result is the creation of a disposable industrial "reserve-army," on which capital can call to meet any special demand; and the existence of this class makes those who are actually employed more dependent and more willing to submit to the dictation of the capitalist. All this had been said in substance by other socialists; but Marx here introduces what appears to be a new conception of his own. The capitalist system, he says, contains within it the seeds of its own destruction. The concentration of vast enterprises in the hands of a few magnates, the centralisation of the means of production in modern industrial establishments, and the associated form which labour takes in these establishments, will make it easy, when the due time arrives, for the state, once subjected to the political control of the proletariate, to step into the place of the capitalist. Those who have been hitherto the expropriators of the workmen will now themselves be forcibly expropriated; all private will be transformed into collective enterprises, and the instruments of production will be used by the whole of society on a definite plan for its common ends.

The new social system thus to be arrived at is the last stage of a historical progress which Marx conceives as follows:—He adopts the view of Hegel (not peculiar, however, to that philosopher or his school) that the life of society is one of ceaseless change, the ideas and institutions of each period having only a rotative and temporary *raison d'être*, and necessarily giving place in due time to others which succeed as members of an ordered series. Marx holds—here diverging from his master—that the determining factor of these changes is purely material. The fundamental and causal element of the social evolution is economic. All other social forms—the legal, literary, religious,—in fact the entire civilisation of an epoch, is the outcome of its economic constitution—of the contemporary modes of production and exchange. The political state of a country at any period reflects the economic requirements of the class then dominating production; and thus all history, subsequent to the primitive community of land-ownership, is a picture of the successive wars of classes. In each period are developed under the ruling class new productive powers which ultimately become irreconcilable with the existing forms of production; and the class which represents these forces, and through them rises into importance, struggles with and overcomes that previously supreme. The constitution of society is changed, and a new order introduced. Thus feudalism was vanquished by the insurgent bourgeoisie; and the bourgeoisie in its turn will be overthrown by the class it now plunders and oppresses—the proletariat. This will be brought about not by any moral triumph of ideas of justice, but by a historical necessity inherent in the existing conditions and movement of industrial life. The long-continued series of social struggles will then be closed; class wars will be brought to an end by the disappearance of classes.

The adherents of Marx's doctrine speak of it as "scientific socialism," in contrast with the "utopian socialism" which in various shapes preceded it. This is certainly unjust, especially to RODBERTUS: if there be such a thing as scientific socialism, Rodbertus is entitled to be regarded as its founder. But, however this may be, Marx's work represents the now-prevalent form of socialism. *Das Kapital* has become, we are told, "the Bible of the social democrats." But it can only be a storehouse of facts and arguments for the leaders; it must be "caviare to the general." An English socialist has described Marx's style as "singularly brilliant"; but that is not the ordinary estimate. Roscher speaks of his "schwerfällig abstracte und doch unpräcise Ausdrucksweise," and Cossa characterises it as "stile sempre oscuro e talvolta inintelligibile."

Das Kapital has been translated into English by S. Moore and E. Aveling. Marx's friend Fr. Engels published in 1878 (2nd ed. 1886) *Herrn Eugen Dühring's Umwälzung der Wissenschaft;* and three chapters of this book were arranged as a pamphlet and translated into French by Marx's son-in-law Paul Lafargue (1880), with the title, *Socialisme utopique et Socialisme scientifique.* A good English version of this tract, bearing the same title, has been published (1892) by E. Aveling, and may be recommended as giving a clear and vigorous statement of the main lines of Marx's doctrine. The most remarkable of Marx's minor publications are the following:—*Einleitung zur Kritik der Hegelschen Rechtsphilosophie*, and *Zur Judenfrage*, 1843, in the former of which appear germs of thought which he afterwards more fully developed, especially his materialistic theory of history; *Die Heilige Familie*, 1845, written in conjunction with Engels in opposition to the philosophic views of Bruno Bauer; *Misère de la Philosophie*, 1847, in which he keenly criticised the *Philosophie de la Misère* of Proudhon, who had at one time much influenced his opinions, and in which the essential features of Marx's general economic system are already distinctly visible; *Discours sur la question du Libre Échange*, 1848; and *Der achtzehnte Brumaire des Louis Bonaparte*, a commentary on the history of the *Coup-d'État*, inspired by fierce indignation against L. Napoleon, and admiring sympathy with the insurgents of June 1848.

[For Marx's biography see art. on him by Fr. Engels in *Handw. der Staatswissenschaften.* Criticisms on his theories will be found in the same work, art. *Sozialismus und Kommunismus*, by Adler; in E. de Laveleye's *Socialisme Contemporain* (English trans. by Goddard Orpen), ch. iv.; Rae's *Contemporary Socialism*, ch. iii.; Bonar's *Philosophy and Political Economy*, bk. v. ch. i.; and the preface by Vilfredo Pareto to a series of extracts from *Das Kapital* published in the *Petite Bibliothèque Economique.* For the chief difficulty in the theory of surplus value and Marx's own way out of it, see Engel's Preface to *Kapital*, vol. iii., 1894, and the article on it by F. Butlin in *Econ. Journal*, 1895.] J. K. I.

MASERES, FRANCIS (1731-1824), mathematician and social reformer, was called to the bar in 1758. During the years 1766-69 he was attorney-general of Quebec. In 1773 he was appointed cursitor baron of the exchequer, a post he held till his death. He is said to have refused an increase of salary, but his private means were large. In 1774 he became a bencher of the Inner Temple, and is among the old benchers immortalised by *Elia.*

Maseres was the author of a *Proposal for establishing Life Annuities in Parishes*, London, 1772. A bill, embodying his scheme, passed the House of Commons in the session of 1772, but was thrown out by the lords. He defended it, in *Considerations on the Bill for enabling Parishes to grant Life Annuities*, London, 1773, 8vo, and again in his magnum opus, *The Principles of the doctrine of Life Annuities familiarly explained*, London, 1783, 4to. Its provisions, which enabled parishes to grant life annuities, and to invest the moneys received in the 3 per cent bank annuities in their own names, are worth noting, inasmuch as some politicians are advocating a solution of the Old-Age Pension question, by leaving to localities a large discretion in the initiation of various schemes. It is but fair, however, to say that Maseres did not believe that the life annuities he proposed would be bought by "day-labourers in husbandry, who are hardly able to save anything out of their wages."

The Principles, etc. is a volume of over seven hundred pages, but the great bulk of this is taken up with applications and illustrations. The actual principles are contained in the first ninety pages. Maseres made use of the tables of KERSSEBOOM and DEPARCIEUX, as given in the appendix of De Moivre's *Treatise on the Valuation of Annuities.* Maseres was also the author of numerous mathematical treatises, of pamphlets on subjects connected with North America, and of translations from the French. He also edited a great number of reprints of historical works.

[*Dictionary of National Biography*, vol. xxxvi. p. 407.] H. E. E.

MASLOV (19th century), a Russian economist, was the author of *Systems of Economics*, 1820; mentioned in Cossa's *Introduction to the Study of Political Economy*, p. 452 (trans. by L. Dyer, London, 1893) as belonging "to the domain of the history of economic literature."

H. E. E.

MASSELIN, JEAN (died in 1500), was a canon of Rouen after 1468 and *orator* of the Norman clergy. Elected by the *bailliage* (bailiwick) of Rouen as its representative in the states general of 1484, he left a journal of their proceedings (*Diarium Statuum Generalium Franciæ*), and was himself on several occasions their spokesman, insisting with a firmness tempered by moderation on the necessity of financial reform.

The *Diarium* of Masselin was published 1835 (text and translation) in the *Collection des Documents Inédits pour l'Histoire de France.* E. Ca.

MASSIE, JOSEPH (d. 1784), economist and pamphleteer. He occupies an important position in the economic history of the 18th century, as a critic of the views of LOCKE and Sir Wm.

PETTY, and as having anticipated certain economic points more generally known in connection with the names of HUME and Adam SMITH. He wrote with insight on the causes of social and industrial evils, *e.g.* begging, prostitution, and theft; and foresaw what a noxious and plentiful crop of ills was springing up for a later generation to deal with, through sentimental philanthropy, the unreformed poor-law, and the herding of deserted and pauper children in barrack "homes." Above all, considering the epoch, he is noteworthy as having been one of the earliest advocates of the systematic study of economic and commercial matters upon a wide and well-verified basis of statistics and history, by applying to economics the inductive method of the Baconian philosophy. His extant works are mainly fiscal, dealing with monetary problems, various branches of trade, and questions of taxation (*v. infra*, Nos. 1-7, 10-12, and 14-25); some of these are quite short, and such as might now be published in the reviews, or even in the daily papers.

The most important of his works are five in number—the *Essay on the Governing Causes of the Natural Rate of Interest* (No. 1), *Calculations of Taxes* (No. 3), the *Plan for the Establishment of Charity-Houses* (No. 8), the *Knowledge of Commerce as a National Concern* (No. 16), and *Observations relating to the Coin of Great Britain* (No. 17).

In the *Natural Rate of Interest*, Massie criticises what he gathers to be the opinion of Locke, that the rate of interest at any given time depends on the proportion which the quantity of money in a country bears to the debts of its inhabitants to one another, and to its trade; that the profits of trade are instrumental in raising interest; and that the proportion which money bears to trade not only governs interest, but the profits of trade as well; while to Sir Wm. Petty, the rate of interest depended upon the quantity of money alone. Massie, on the other hand, who may or may not have been acquainted with Nicholas BARBON'S *Discourse of Trade* (1690), of which there seems to have been no copy among the fifteen hundred economic books and pamphlets which Massie collected at great outlay of time and money, and who anticipated Hume's published opinion on the same line of thought by two years, believed the governing causes to be (1) natural necessity; (2) liberty; (3) the preservation of men's private rights; (4) public security. He therefore concludes that the natural rate of interest is governed "by the profits of trade to particulars"; that the profits of trade are governed by the proportion which the number of traders bears to the quantity of trade; and that the number of traders in turn is governed by the necessity of trade, and the encouragement with which it meets.

In *Calculations of Taxes*, Massie pours mild ridicule on the "ingenious men" who had evolved the proportion of taxation to incomes out of their inner consciousness. No calculations could be valid unless based on the following data: (1) the number of people in the nation; (2) the pecuniary amount of their incomes or needful expenses; (3) the rise in prices both of commodities and of labour, which is caused by taxation; (4) the total sum paid annually in taxation throughout the whole kingdom. At the time Massie wrote the last item alone of these data was verifiable in the ordinary way. In order to arrive at some approximate idea of the proportionate amount of taxation contributed by individuals, he works out thirty typical cases, each containing such an annual balance-sheet as might naturally be worked out by each of thirty different heads of families in receipt of thirty different incomes, from a wealthy nobleman with a rent-roll of £20,000 a year to a rural labourer on 5s. a week.

The *Plan for the Establishment of Charity-Houses* and the other essays on social reform in the same volume are not only among the most interesting of Massie's writings in themselves, but are valuable on account of three positions which he there lays down, viz. (1) that the Elizabethan poor-law was a *causa causans* of evils which it was intended to cure; (2) that the removal of multitudes of people from "our natural and fixed basis, land, to the artificial and fluctuating basis, trade," is fraught with grave social and industrial evils; and (3) that the problem of prostitution is really not so much moral as economic. The remedies which Massie proposed were the equalisation of poor-rates in different localities, and the abolition of the settlement clauses of the poor-law; the union of parishes to support a workhouse; the entire separation of the honest and respectable poor from the loafer, the casual, and the "suspect," the three latter to be punished and put to hard labour in quite separate but neighbouring establishments, while the taint of pauperism was not to be attached to the former; the teaching of new trades to the honest and respectable poor, and the careful selection of new trades so as to avoid increasing the keenness of competition among persons already provided with suitable employment elsewhere; the establishment of charity-houses or "preservatories" for unemployed, deserted, or destitute women and girls, where they would be quite safe, and free from workhouse taint, and which would serve both as labour-bureaux and as training schools in newer industries. Massie laid great stress on national care for working women and girls, partly for the sake of the next generation; partly because competition for work, being within much narrower limits, is keener for women who stand alone than for men; partly from humanity, because they cannot resist brute force; and partly because a ruined woman almost inevitably becomes a social danger. In return for the national service rendered by women in every rank of life Massie held that the nation, and particularly London, should protect them from being driven to evil courses by economic distress, by means of a penny rate levied on all houses in the metropolis on the basis of the poor-rate assessment, in addition to voluntary contributions. Other contributory causes of 18th-century lack of employment Massie held to be the decline of the woollen trade, the enclosure of commons and waste lands, and the growing practice of letting *e.g.* 500 acres to one farmer rather than 50 acres to each ten farmers.

The *Representation concerning the Knowledge of Commerce as a National Concern* is a plea (1) for such organised national collection and systematic storage of economic and commercial facts as is now provided for, to a limited but increasing extent, by the various departments of the Board of Trade; (2) for the compilation of adequate outlines of commercial history—Massie here incidentally mentions that though he had spent twelve years in collecting some 1500 tracts, treatises, pamphlets, etc., on economic subjects, he yet found it impossible to compile satisfactory outlines of the history of any one British industry; and (3) for the recognition of economics as a branch of liberal education and learning, to be dealt with by persons of wide knowledge, trained intelligence, and impartial soundness of judgment, who would discover "fixed principles" instead of trying to further personal commercial interests.

Observations relating to the Coin of Great Britain criticises Locke's views on money, and contains Massie's own suggestions as to remedying the then scarcity of silver and the over-valuation of gold, and a reprint of Sir Wm. Petty's *Quantulumcunque*. In Massie's opinion the main thesis, which Locke had failed to *prove*, was that "money cannot be raised above its intrinsic value, or, in other words, be made to pass current for more than the gold and silver in it is really worth as bullion"; that an artificial over-valuation cannot be maintained, and that the only effect of such attempt is to cause a proportionate rise in prices. "The proper remedy for the present scarcity of silver money is reducing the current rates of guineas, and of other gold coins, which have long passed for more shillings and pence than the gold contained within them in bullion, when compared with the value of silver in bullion."

Massie's lesser works contain shrewd remarks apropos of *inter alia* the habitual fleecing of the British consumer by the West Indian sugar-planters; the fatuity of imposing a new cyder-tax just when the woollen trade showed a tendency to migrate from the cyder counties into beer-drinking Yorkshire; the raising of extra means to carry on the war (1757) by the commercially harmless plan of laying a tax on bachelors and childless widowers; and the view that the North American colonies were a distinct hindrance rather than an advantage to British trade.

Massie wrote and published at London, usually, if not always, at his own expense, the following works:

(1) *Essay on the Governing Causes of the Natural Rate of Interest*, 1750, 8vo.—(2) *Observations upon Mr. Fauquier's Essay on Ways and Means for raising Money to support the present War*, 1756, 8vo.—(3) *Calculations of Taxes for a Family of each Rank, Degree or Class: for one year*, 1756, 8vo.—(4) *A Letter to Bourchier Cleeve, Esq.; concerning His Calculations of Taxes*, 1757, 8vo.—(5) *Considerations on the Leather Trade of Great Britain*, 1757, 8vo.—(6) *Ways and Means for Raising the Extraordinary Supplies to carry on the War for Seven Years*, etc., 1757, 8vo.—(7) *Reasons humbly offered against Laying any further British Duties on wrought silks of the manufacture of Italy, the Kingdom of Naples and Sicily, or Holland*, 1758, 4to.—(8) *A Plan for the Establishment of Charity-Houses for Exposed or Deserted Women and Girls, and for Penitent Prostitutes; Observations concerning the Foundling-Hospital, Shewing the Ill Consequences of giving Public Support thereto; Considerations relating to the Poor and the Poor's-Laws of England; also A New System of Policy, most humbly proposed, for Relieving, Employing, and Ordering the Poor of England;* and *Forms of the principal Accounts necessary to be kept for those Purposes*, 1758, 4to.—(9) *Orders appointed by His Majestie (King Charles I.) to be straitly observed, for the Preventing and Remedying of the Dearth of Graine and Victuall* (a reprint), 1758, 8vo.—(10) *A Proposal for making a Saving to the Public of Many Thousand Pounds a Year in the Charge of Maintaining His Majesty's Marine Forces*, 1758, 4to.—(11) *Calculations and Observations relating to an Additional Duty upon Sugar*, 1759, s. sh. fol.—(12) *A State of the British Sugar-Colony Trade; shewing, that an Additional Duty of Twelve Shillings per 112 Pounds Weight may be laid upon Brown or Muscovado Sugar*, 1759, 4to.—(13) *Farther Observations concerning the Foundling-Hospital*, 1759, 4to.—(14) *A Computation of the Money that hath been exorbitantly Raised upon the People of Great Britain by the Sugar-Planters, in One Year, from January 1759 to January 1760*, 1760, s. sh. fol.—(15) *To the Printer of the Gazetteer. A list of the various classes of people employed in . . . the Woollen Manufactory; A State of the Exports to and Imports from the British Sugar-colonies; Facts . . . relating to the new Malt Tax*, etc., etc., 1760, obl. fol.—(16) *A Representation concerning the Knowledge of Commerce as a National Concern*, 1760, 4to.—(17) *Observations relating to the Coin of Great Britain . . . whereunto is annexed, Sir William Petty's Quantulumcunque concerning Money*, 1760, 4to.—(18) *Reasons humbly offered against laying any farther Tax upon Malt or Beer*, 1760, s. sh. fol.—(19) *General Propositions relating to Colonies*, 1761, s. sh. 4to.—(20) *Brief Observations concerning the Management of the War, and the Means to prevent the Ruin of Great Britain*, 2nd ed., 1761, 4to.—(21) *An Historical Account of the Naval Power of France, from its first Foundation to the present Time, with a State of the English Fisheries at Newfoundland for 150 Years past . . . to which is added, a Narrative of the Proceedings of the French at Newfoundland, from the Reign of King Charles the first to the Reign of Queen Anne . . . First printed in the Year 1712, and now reprinted for general Information*, 1762, 4to.—(22) *Observations relating to British and Spanish Proceedings . . . to which is added a Proposal for replacing the New Taxes on Malt and Beer*, 1762, 4to.—(23) *Observations on the new Cyder-Tax, so far as the same may affect our Woollen Manufactures, Newfoundland Fisheries*, etc., 1764, fol. and 4to.—(24) *Brief Observations and Calculations on the present high Prices of Provisions*, 1765, s. sh. fol.—(25) *The Proposal, commonly called Sir Matthew Decker's Scheme, for one general Tax upon Houses, laid open, etc.*, date uncertain, but probably in or shortly after 1757.—(26) Papers of ephemeral political interest.—(27) MS. catalogue of Massie's

collection of economic books, pamphlets, etc., dated 29th November 1764, Lansdowne MS. 1049 in British Museum.

E.D.

MASTER AND SERVANT. The early history of the relation of master and servant in England is that of a gradual transition from a relation of status to one of contract. In Anglo-Saxon times there were two classes of workers, the *ceorls* and the *theows*, whose condition differed somewhat. The ceorls were in a condition intermediate between slavery and freedom, corresponding to that allowed by a conquering race to friendly natives of an invaded country: they had a certain choice of masters; they could hold land; they sometimes had slaves of their own; they had certain rights in the township lands; they might acquire property, might purchase their freedom and might even become thanes. The theows were real slaves, as if they represented conquered hostile natives (*nativi*): they were not allowed to leave the land; they had no remedies against violence on the part of their master, and an injury done to them was a wrong done to the master; and they were, in fact, frequently sold abroad. The number of these slaves was increased by constant wars and by the practice of selling oneself to buy food or to pay a weregeld or to maintain a privilege of asylum. On the other hand, slavery tended to disappear under the influence of the church, which encouraged manumission; but at the same time the ceorls probably tended to become worse off. After the conquest, the condition of the actual slaves seems to have become better, while that of the ceorls and the Saxon masters was depressed; so that we find them mostly grouped as different varieties of one class of serfs or villeins. As time went on, the lot of the villein, though painted by Bracton in 1289 in miserable colours from the legal point of view, seems to have undergone substantial amelioration: various modes of becoming a freeman became available, such as becoming a member of a gild in a privileged town and remaining in that town for a year and a day, escaping as runaways and not being followed up, being emancipated in order that they might be engaged as soldiers, and so forth; and in particular, he who had entered into a contract with his lord was considered as a freeman, and such contracts became very frequent, for the indefinite villeinage services were largely commuted for fixed money payments. Thus we find villeins holding land in their own right and employing labourers; so that except locally, in particular manors, the grievous incidents of villeinage (*see* VILLEINAGE) as described by Bracton seem, as Professor Thorold Rogers has pointed out, to have died out by the end of the 13th century, at any rate in their extreme form. The tendency to loosen the bonds of villeinage through neglect on the part of the lords, or through commutation of indefinite services for definite money rents, was at the same time somewhat neutralised by a tendency to read into the institution of villeinage the doctrines of SERVITUS (*q.v.*) of the Roman law; but the burden of proof came to rest on the lord asserting a claim, for much land had come to be held under villeinage tenure by persons whose status was that of freemen; and in the meantime the presumption of law was in favour of freedom, so that no seizure could be effected of any person alleged to be a villein. Thus things went on until the year 1349. In the meantime a great class of free labourers or craftsmen had sprung up in the towns; united in GILDS (*q.v.*) they were free as against the world, but were much restricted by the bye-laws of the gilds, which themselves restricted the individual liberty of non-members as far as they could, through prescription or custom, assert the right of doing so. In 1349 came the great plague, which thinned the ranks of labourers and raised the rate of wages. This was felt by the employers of the day to be a great evil; the old rights of villeinage were reasserted, and various attempts were made to enforce them. From the middle of the 13th to the middle of the 14th century the struggle lasted. The villeins resisted being interfered with, by litigation, by force, by rebellion, by ignoring the Ordinance of 1349 and the confirming statute of 1351 which attempted to regulate wages; and on the other hand, passports for travelling, poll-taxes, attempted exclusion from apprenticeship, investigation of pedigrees, and the like, were set in force; but the upshot was a practical defeat of the lords, for we find no averment in Jack Cade's rebellion of 1450 that the exactions of the lords were a grievance. By the time of Edward VI. and Elizabeth, villeins in gross—that is, persons whose personal status was that of villeinage—had almost died out; villeins regardant—that is, persons holding under villeinage tenure, and who might possibly be freemen—became merged in the copyholders; and the last reference to villeinage occurs in a law-suit of the year 1618, in which it was pleaded. Simultaneous with the decadence of the villeinage system was the growth of free labour; but its grievance was the want of work. The population grew much more rapidly than the means of support; and though many became attached to the manor-houses as "idle serving men" whose wages were nominal but who were fed and lodged, there

were still many reduced to vagrancy. This feature of English life first becomes extremely prominent during the reign of Henry VIII., and it was thought fit to enact the most severe laws against vagrancy or wandering in search of employment, from the place of settlement, without licence to do so. The attempt to suppress vagrancy was combined (5 Eliz. c. 4) with an attempt to regulate wages and to keep craftsmen under control: apprenticeship was enforced; craftsmen must render service in their craft when called upon, and that at rates to be fixed by the justices at Easter sessions; and refusal to do so was enforceable by imprisonment. As regards workmen, the policy of the act of Elizabeth was the policy of English law until 1867: breach of contract of service remained until that year an offence punishable by imprisonment; and a long series of acts extended the principle to particular cases and made it, after the Union, apply to Scotland. Any able-bodied person not having any visible means of livelihood could, at law, be put to service; but a large part of the original act had long fallen into abeyance, for the justices had long ceased to assess wages at sessions. Overlapping these acts were the series of FACTORY ACTS from 1802 onwards, and the Merchant Shipping Acts; and in 1867 the contract of service was finally reduced to the same condition as any other contract, and breach of it made punishable, except in particular instances, only by damages, while combination was no longer illegal as a means of keeping up or raising wages, and the restrictions on the emigration of workmen were removed. The relation of master and servant is thus now a question of contract: but Mr. Macdonell points out in *Master and Servant* that there are still some points in respect to which the maxims of English law seem to a greater or less extent to have been founded on the relation of status. These are: that a master is justified in committing an assault in defence of his servant, or a servant of his master; that possession by the servant is possession by the master, and that the master is liable for his servants' acts, apparently to an extent beyond that traceable to mere agency; that an action lies for enticing away or harbouring a servant; that the master has, in theory, a right of correcting his servant, though this is now probably not the law; and that in many cases somewhat outside the domain of mere agency, acquisitions by the servant are acquisitions for the master. Besides this, the older ideas seem to cling to the word "servant," so that it is very difficult to frame a definition of it, applicable to all cases, from those of a Carriers Act to an action by a father for loss of his daughter's services by seduction of her. Mr. Macdonell suggests the following: —"One who for a consideration agrees to work subject to the orders of another."

[An excellent historical summary, with full references, is given in Macdonell's *Master and Servant;* which, with Smith's *Master and Servant*, and Eversley's *Law of the Domestic Relations*, may also be consulted for the law. For the Scots law, see Fraser's *Master and Servant.*—See Vinogradoff, *Villainage in England.*—Broom, *Constitutional Law* (Somersett's case and the notes upon it). See MANOR.] A. D.

MASTERS' ASSOCIATIONS. Some of these societies aim at providing the benefits of insurance and trade protection for their members, without any special reference to their relations with their work-people, while others have been formed for the express purpose of joint resistance when individual employers have found themselves too weak to cope with the growing strength of the men's trade unions. The majority, however, may be considered to have both objects in view. There are at present about 100 of these masters' associations in existence, about a quarter of the total number being connected with the building trade. Being "temporary or permanent combinations for regulating the relations between workmen and masters, or masters and masters," they are trade unions within the meaning of the trade union acts. Very few of them, however, are registered under those statutes (see TRADES UNIONS). T. G. S.

MASTROFINI, MARCO (19th century), born at Monte Compatri near Rome. He became an abbé, and is best known to economists through his book on usury, *Le usure* (Rome, 1831), which was well received, republished several times, and gave rise to much discussion. Though Mastrofini lived in this century, his opinions entitle him to be ranked among the canonists. His book in fact revives the old disputes as to the lawfulness of interest (see CANON LAW).

Mastrofini analyses the question of usury, taking it primarily from the standpoint of the ecclesiastic and of the moralist, rather than from that of the political economist. He argues from a desire to reconcile the doctrine of the church with the requirements of economics, and with a somewhat ostentatious display of learning in support of a theory, already broached by other writers, that the prohibition of the canonists referred not to interest received on money, but to usury in its more modern sense, that is to say, to exorbitant interest. He therefore asserts that a moderate compensation for the loan of capital is theologically permissible. He further maintains that the church prohibition had reference only to poor debtors. But while we may appreciate Mastrofini's endeavours to legalise, from a theological point of view, a fact which is rooted in the public economy of the world, we must recognise that his assertions are historically incorrect, and not based on a thoughtful interpretation of those on whose testimony he relies.

MATHEMATICAL METHOD IN POLITICAL ECONOMY. The idea of applying mathematics to human affairs may appear at first sight an absurdity worthy of Swift's Laputa. Yet there is one department of social science which by general consent has proved amenable to mathematical reasoning—STATISTICS. The operations not only of arithmetic, but also of the higher calculus, are applicable to statistics (see ERROR, LAW OF, and PROBABILITY). What has long been admitted with respect to the average results of human action has within the last half-century been claimed for the general laws of political economy. The latter, indeed, unlike the former, do not usually present numerical constants; but they possess the essential condition for the application of mathematics: constancy of *quantitative*—though not necessarily numerical—relations. Such, for example, is the character of the law of DIMINISHING RETURNS (*q.v.*): that an increase in the capital and labour applied to land is (tends to be) attended with a less than proportionate increase in produce. The language of FUNCTIONS is well adapted to express such relations. When, as in the example given, and frequently in economics (see Marshall, *Principles*, preface, p. xiv.), the relation is between *increments* of quantities, the differential calculus is appropriate. In the simpler cases the geometrical representations of functions and their differentials may with advantage be employed (cp. CURVES and FUNCTIONS).

Among the branches of the economic calculus *simultaneous equations* are conspicuous. Given several quantitative—though not in general numerical—relations between several variable quantities, the economist needs to know whether the quantities are to be regarded as *determinate*, or not. A beautiful example of numerous prices determined by numerous conditions of supply and demand is presented by Prof. Marshall in his "bird's-eye view of the problems of joint demand, composite demand, joint supply, and composite supply" (*Principles*, Mathematical Appendix, note xxi.). "However complex the problem may become, we can see that it is theoretically determinate" (*Ibid.*, cp. Preface, p. xv.). When we have to do with only *two* conditions, two *curves* may be advantageously employed instead of two *equations* (see CURVES and FUNCTIONS).

The mathematical operations which have been mentioned, and others—in particular the integral calculus, are all contained in the calculus of *maxima* and *minima*, or, as it is called, *of variations;* which seems to comprehend all the higher problems of abstract economics

For instance, Prof. Marshall, after writing out a number of equations "representing the causes that govern the investment of capital and effort in any undertaking," adds, "they may all be regarded as mathematically contained in the statement that H − V [the net advantages] is to be made a maximum" (*Principles*, Mathematical Appendix, note xiv.). It was profoundly said by Malthus, "Many of the questions both in morals and politics seem to be of the nature of the problems *de maximis et minimis* in fluxions." The analogy between economics and mechanics in this respect is well indicated by Dr. Irving Fisher in his masterly *Mathematical Investigations*.

The property of dealing with quantities not expressible in numbers, which is characteristic of mathematical economics, is not to be regarded as a degrading peculiarity. It is quite familiar and allowed in ordinary mathematics. For instance, if one side of a plane triangle is greater than another, the angle opposite the greater side is greater than the angle opposite the less side (*Euclid*, Book I.). Quantitative statements almost as loose as those employed in abstract economics occur in the less perfectly conquered portions of mathematical physics, with respect to the distances of the fixed stars, for instance (see Sir Robert Ball, *Story of the Heavens*, ch. xxi.); *e.g.* before 1853 it was only known that "the distance of 61 Cygni could not be *more* than sixty billions of miles." It is really less than forty billions.

The instance of astronomy suggests a secondary or indirect use of mathematical method in economics, which physical science has outgrown. As the dawn of the Newtonian, or even of the Copernican, theory put to flight the vain shadows of astrology, so the mere statement of an economic problem in a mathematical form may correct fallacies. Attention is directed to the data which would be required for a scientific solution of the problem. Variable quantities expressed in symbols are less liable to be treated as constant. This sort of advantage is obtained by formulating the relation between quantity of precious metal in circulation and the general level of prices, as Sir John Lubbock (senior) has done in his pamphlet *On Currency* (anonymous, 1840). Thus the mathematical method contributes to that negative or dialectic use of theory which consists in meeting fallacious arguments on their own ground of abstract reasoning (see some remarks on this use of theory by Prof. Simon Newcomb in the June number of the *Quarterly Journal of Economics*, 1893; and compare Prof. Edgeworth, *Economic Journal*, vol. i. p. 627). The mathematical method is useful in clearing away the rubbish which obstructs the foundation of economic science, as well as in affording a plan for the more regular part of the structure.

The modest claims here made for the mathe-

matical method of political economy may be illustrated by comparing it with the literary or classical method in the treatment of some of the higher problems of the science. The fundamental principle of supply and demand has been stated by J. S. Mill with much precision in ordinary language (*Pol. Econ.*, bk. iii. ch. 2, §§ 4, 5, and, better, review of Thornton, *Dissertations*, vol. iv.). But he is not very happy in indicating the distinction between a rise of price which is due to a diminution of supply—the dispositions of the buyers, the DEMAND CURVES remaining constant—and the rise of price which is due to a displacement of the demand curve. He appears not to perceive that the position of equilibrium between supply and demand is *determinate*, even where it is not *unique*—a conception supplied by equations with multiple roots or curves intersecting in several points. The want of this conception seems to involve even Mill's treatment of the subject in obscurity (*Pol. Econ.*, bk. iii. ch. 18, § 6).

The use of simultaneous equations or intersecting curves facilitates the comprehension of the "fundamental symmetry" (Marshall) between the forces of demand and supply; the littérateurs lose themselves in wordy disputes as to which of the two factors "regulates" or "determines" value.

The disturbance of the conditions of supply by a tax or bounty, or other impediment or aid, gives rise to problems too complicated for the unaided intellect to deal with. Prof. Marshall, employing the mathematical theory of CONSUMERS' RENT, reaches the conclusion that it might *theoretically* be advantageous to tax commodities obeying the law of decreasing returns in order with the proceeds to give bounty to commodities following the opposite law (*Principles*, bk. v. ch. xii. § 6). The want of the theory of consumer's rent renders obscure Mill's treatment of the "gain" which a country may draw to itself by taxing exports or imports (*Pol. Econ.*, bk. v. ch. 4, § 6; cp. bk. iii. ch. 18, § 5). This matter is much more clearly expressed by the curves of Messrs. Auspitz and Lieben (*Untersuchungen*, Art. 81).

The preceding examples presuppose free competition; the following relate to monopoly. The relation between the rates and the traffic of a railway is shown with remarkable clearness by the aid of a diagram in the appendix to Prof. Hadley's *Railroad Transportation*. By means of elaborate curves Prof. Marshall shows that a government having regard to the interest of the consuming public, as well as to its revenue, may fix a much lower price than a monopolist actuated by mere self-interest. The taxation of monopolies presents problems which require the mathematical method initiated by COURNOT. His reasoning convinces of error the following statement made by Mill (bk. v. ch. 4, 6) and others: "A tax on rare and high-priced wines will fall only on the owners of the vineyard," for "when the article is a strict monopoly . . . the price cannot be further raised to compensate for the tax." Cournot obtains by mathematical reasoning the remarkable theorem that in cases where there is a joint demand for articles monopolised by different individuals, the purchaser is apt to come off worse than if he had dealt with a single monopolist. This case is more important than at first sight appears (see Marshall, *Principles*, bk. v. ch. x. § 4).

Under the head of monopoly may be placed the case of two individuals or corporate units dealing with each other. The indeterminateness of the bargain in this case is perhaps best contemplated by the aid of diagrams (see on this case article on EXCHANGE, VALUE IN, and references there given).

These examples, which might be multiplied, seem to prove the usefulness of the mathematical method. But the estimate would be imperfect without taking into account the abuses and defects to which the method is liable. One of these is common to every *organon*—especially new ones—liability to be overrated. As Prof. Marshall says, "When the actual conditions of particular problems have not been studied, such [mathematical] knowledge is little better than a derrick for sinking oil-wells where there are no oil-bearing strata." Again, the mathematical method is a machinery, the use of which is very liable to be overbalanced by the cost to others than the maker of acquiring it. Not only is mathematics a foreign language "to the general"; but even to mathematicians a new notation is an unknown dialect which it may not repay to learn. As Prof. Marshall says, "It seems doubtful whether any one spends his time well in reading lengthy translations of economic doctrines into mathematics that have not been made by himself."

This estimate of the uses and dangers of mathematical method may be confirmed by reference to the works in the subjoined list; which does not pretend to be exhaustive.

MATHIAS DE SAINT JEAN, Jean Éon (1600-1681), known as *Frère procureur général* of the Carmelite friars in France, pub. under the name of "an inhabitant of Nantes," *Le Commerce Honorable ou Considérations politiques contenant les motifs de nécessité, d'honneur et de profit qui se trouvent à former des Compagnies de toutes personnes pour l'Entretien du Négoce de Mer en France*, Nantes, 1646.

As shown by the title, this book initiates the policy followed later by Colbert when he encouraged the foundation of the great trading companies with both Indies, the Levant, and Senegal. Mathias has a general and a special object. His general object is to demonstrate the natural usefulness and legitimacy of international trade and navigation, "which afford the most convenient and easy means granted by God to establish a perfect and universal society amongst the nations of the earth" (p. 133), an argument on which Mathias extensively dilates with great warmth and insight. His special object is to prove that French navigation being in a condition of utter decay, which he ascribes to the national want of enterprise, to depreciation of trade as a profession, and to the keenness of foreign competition, the securest way to emerge from this state of stagnation is to establish powerful trading and maritime companies, the shares of which ought to be subscribed by the French *noblesse;* this, he maintains, can be done without any fear or danger of a loss of status on their part. He also gives detailed statistical information on the imports effected in French ports by foreign bottoms, and calculates the profits which foreigners derive from these imports.

As to the practical legislation recommended, Mathias is not very consistent with his premises on the inherent usefulness of international trade. In his opinion the exclusion of foreign flags and strict reciprocity of custom-house duties would be insufficient to restore prosperity to French trade, and he advocates the return to the "just and wise by-laws" (p. 61), against foreign merchants which compelled them to take up their abode in the house of a known merchant,[1] and to offer their wares for sale at once. But he did not allow them to act as agents of foreign commercial houses. E. Ca.

MATTIA (di), Nicola (18th century). Mattia, in reply to the inquiry made in 1802 by the Neapolitan government as to the best means of maintaining the poor (see Marulli), says that charity can be but a temporary remedy in doing this which can only be secured by placing poor citizens in a position to supply their wants by their own work. The real remedy for begging and vagrancy is to eliminate the causes of the evil by encouraging the sources of wealth. Charitable assistance should be temporary, and only given to those incapable of work. Almshouses even should be temporary, because the hope of finding an asylum in them encourages idleness. Vagrancy should be remedied by cultivating the uncultivated land in the kingdom of Naples, and thus forming a civilised and industrious nation. Mattia proposes the establishment of houses of correction and the assigning to them of waste land for cultivation.

Riflessioni su l'impiego dei poveri e dei vagabondi, e sul modo di estirparli dalla società civile, relativamente al Regno di Napoli, Naples, 1805.

MATRICULATION TAX. See Finance, Germany.

MATURITY OF BONDS. A bond, or debenture, usually matures after a given time, and is then presentable for redemption to the issuing state or corporation like a matured bill. Sometimes a bond is "drawn" by lot, and is then redeemable at par, or at some specified price, and those who possess bonds, subject to such drawings, should ask their banker or broker to make proper inquiry from time to time. A. E.

MAUGHAM, Robert (d. 1862), co-founder with Bryan Holme of the Incorporated Law Society, and its first secretary. Maugham was an active promoter of the interests of the legal profession, and wrote several legal textbooks and handbooks. His chief work, from the economic standpoint, is his *Treatise on the Principles of the Usury Laws*, in which, taking as a motto Shakespeare's "Borrowing dulls the edge of husbandry," he briefly traces the history of the statutory regulation of interest on loans, adversely criticises the proposal made in the early years of this century to repeal the usury laws which fixed the maximum rate of interest at 5 per cent, and contends that, while the laws may occasionally press hardly on individuals, it is essentially desirable, in the interest of the nation generally and on general principles of public utility, that there should be some legal restriction upon the rate of interest demanded. Further, he maintains that there are excellent reasons, given in detail, why there should be some distinction in the law between dealing in money and dealing in other species of property. He criticises Bentham's *Defence of Usury* closely and in detail, and also examines the criticism of Lord Redesdale's views by Sir W. D. Evans, quotes from Grotius, Pufendorf, Vattel, Paley, Bacon, Blackstone, and Adam Smith, and refers also to the Jewish regulations, which were political rather than ethical. Maugham also wrote a treatise on the

MAUNDY MONEY. The royal alms, known as "His Majesty's Royal Maundy," are distributed annually by the Lord High Almoner on Maundy Thursday, on behalf of the King. They consist of various cash payments made to persons of both sexes over sixty years of age, who are in necessitous circumstances, and who have at one time given employment to others and paid rates and taxes.

One of the maundy gifts is a payment, made in silver coins, of the value of as many pence as the years of the reigning sovereign's age, to a like number of persons of both sexes. In the present year (1905), therefore, sixty-four men and sixty-four women receive the sum of 5s. 4d. apiece. The money is paid entirely in silver coins of the nominal value of 1d., 2d., 3d., and 4d. respectively, and it is to these small silver pieces, which are struck specially at the Royal Mint for the purpose, that the title "Maundy Money" is applied. These coins bear on the obverse the effigy of His Majesty, with the inscription, "Edwardus VII. D : G : Britt : Omn : Rex : F : D : Ind : Imp : ; and on the reverse the figure "1," "2," "3," or "4," surrounded by a wreath of oak and laurel leaves, and surmounted by the royal crown. The edges of the coins are not milled, and the threepences, therefore, are identical with the coins of that denomination struck for general circulation. Collectors of coins frequently purchase the maundy monies from the original recipients, at enhanced prices, and with the exception of the threepences, a few of which may occasionally find their way into circulation, maundy coins do not pass into general use. The first coinage of small silver pieces intended solely for distribution on Maundy Thursday was struck in 1663. Prior to that date silver pence had been struck for general circulation, and the coins which formed part of the maundy alms were such as were to be found in the ordinary currency of the country.

The title Maundy, applied to the Thursday before Easter, is derived from "dies mandati"—the day of the mandate—as, on the day before Good Friday, Christ, after washing the disciples' feet, gave his new commandment, "That ye love one another" (John xiii. 34). Hence arose the custom of washing the feet of the poor by royal and other distinguished persons. This ceremony, which was accompanied by doles of food and clothing, can be traced back to the 4th century. James II. was the last king of England who washed the feet of the recipients of the maundy doles, but the custom is still occasionally observed in Austria and other European countries. The baskets from which the "mandate bread" was given away became known as "maunds."

At the ceremony of washing the feet of the poor, it was an ancient custom of the kings and queens of England to present one or two of the most necessitous with a gown from the royal wardrobe. This gift was, however, subsequently redeemed by a money payment supposed to represent the value of the garment.

As no provision was made to ensure the suitability of the maundy gifts to the various requirements of the poor persons, somewhat rough bartering among the recipients frequently took place, and, with a view to check these practices, the various doles were from time to time substituted by money payments, the last of the gifts in kind to survive being that of clothing for the men, which was distributed so recently as the year 1881. It having been found, however, that in most instances the men parted with the goods for less than their original cost, a sum of £2 : 5s. per head is now given instead of clothing. Thus the maundy alms are at the present time composed entirely of cash payments, amounting in all to about £5. The total sum is made up as follows: (1) The gift of pence per year of the sovereign's age, which is handed to the selected persons in a white leather purse; (2) sums of £1 : 10s. in lieu of provisions, and £1 in lieu of the gown formerly given by the sovereign, inclosed in a red leather purse; and (3) a further gift of 35s. to the women, or 45s. to the men in lieu of clothing, this last gift being inclosed in a paper packet.

The ceremony of the distribution of the maundy alms, which is of much interest, took place in the Chapel Royal, Whitehall, from 1714 to 1890, but since the latter date, the chapel having been closed, the gifts are distributed in Westminster Abbey. F. E. A.

MAURICE, JOHN FREDERIC DENISON (1805-1872), is noticed here for his connection with the Christian socialists (see CHRISTIAN SOCIALISM). We must remember, however, his protest against the "attempt to treat a human being as composed of two entities, one called religious, the other secular." As early as 1836 he expressed

his conviction that "political economy is not the foundation of morals or politics, but must have these for its foundation or be worth nothing." For many years he brooded over social questions. As chaplain at Guy's Hospital, we find him regretting his own helplessness. In 1840 and again in 1842 weighty letters from Mr. Daniel Macmillan, on the divorce of the Church and the leaders of the working classes, addressed to Archdeacon Hare, and forwarded to Maurice, gave much food for thought. In 1844 he made acquaintance with C. KINGSLEY and was appointed in 1846 chaplain at Lincoln's Inn. In the same year Mr. Ludlow suggested to him a scheme for bringing the leisure and good feeling of the Inns of Court to bear upon the destitution and vice of the neighbourhood. In 1848 he became editor of *Politics for the People*, a weekly publication, which only lived through seventeen numbers. The first number, on 6th May, contained a characteristic article by him on "Fraternity." In December of the same year the Bible readings were begun, from which sprang the meetings with working-men, held at Maurice's house during 1849. These meetings bore fruit in the starting of a Tailors' Co-operative Association. Maurice had appeared, at times, somewhat lacking in enterprise; he had a natural distrust of the spasmodic energy of the "go ahead." In advocating co-operation, he did not commit himself to any specific social plan. He remained throughout true to the conviction that the fundamental fallacy lay in "assuming that lands, goods, money, or labour are the basis of society, whereas human relations not only should, but do, lie beneath." In November 1850 appeared the first number of the *Christian Socialist*. By socialism Maurice meant "the acknowledgment of brotherhood in heart, and fellowship in work." The name suggested a struggle with unsocial Christians and un-Christian socialists. Years afterwards he justified its use on similar grounds. Yet above all he dreaded the formation of a new party with himself as leader. He protested against elaborate machinery, and held that to build associations upon decrees of a central board, was to build upon the sand. He saw clearly the danger of weakening moral influence by intermeddling with commercial details, and recognised in the Working-Men's College, founded in 1854, a more excellent way of serving co-operation. The following passage, written in 1849, and repeated almost verbatim in 1868, represents his economic faith. "The state, I think, cannot be communist; never will be; never ought to be. It is by nature and laws conservative of individual rights, individual possessions. . . . But the church, I hold, is communist in principle; conservative of individual rights and property only by accident. . . . The union of church and state . . . is precisely that which should accomplish the fusion of the principles of communism and property." It is noteworthy how closely this view resembles that of the CANON LAW (*q.v.*) towards private property. Nothing is easier than to criticise the Christian socialists: that the co-operative societies started by them mostly failed, while those started by the hard-headed workmen of the north (see CO-OPERATION) succeeded, was only what was to be expected. Yet even the direct results were not without importance, since the act of 1852, which legalised the position of such societies, was mainly their work. It is, however, to the indirect results that we must chiefly look. If the whole attitude of the working-class leaders towards religion and culture has been revolutionised, if the church of England, in its relations with the English people, has felt the breath of a new spirit, it is to the Christian socialists, and above all to Maurice, that the result is in large measure due. When he died there was a burst of popular grief such as had not been, it was said, since the death of the Duke of Wellington. Mystic, subtle, as he might be, working men understood him, because he understood them and their requirements—that a message for them to grasp must be something other and more living than mere opinions.

Of his forty-eight published volumes, not one is directly concerned with economic questions, and yet of all of them it may be said, as of his preaching at Lincoln's Inn, that whatever turn they take, they bring one's thoughts to the present day. As a good example of his manner may be cited the Lecture on masters and servants, in *Social Morality*, London, 1869, 8vo.

[For his attitude towards social questions see the correspondence in his life, edited by his son, Frederic Maurice, London, 1884, 8vo, 2 vols., and Charles Kingsley's Life, edited by Mrs. Kingsley, London, 1877, 8vo, 2 vols.—Art. by Prof. John on "Genossenschaftsbewegung" in *Zeitschrift für Volkswirthschaft* (Wien, band iii. heft iii. October 1894).—Art. by Thos. Hughes in *Econ. Review*, April 1891.] H. E. E.

MAUVILLON, JAKOB (1743-1794), an eminent German economist of the school of the PHYSIOCRATS, was born at Leipzig, the son of a Frenchman settled there as teacher of languages. He studied the science of engineering, and in 1771 entered the Carolinum at Cassel as teacher of military architecture; here the title of captain was conferred on him in 1778. In 1784 he was called to the Carolinum at Brunswick as teacher of politics and military tactics; here he attained the rank of lieutenant-colonel. His literary career began with translating French and English works and treatises into German, particularly the *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes*, by RAYNAL (Hanover, 1774-78). His conversion to the doctrines of the physiocrats was brought

about by translating Turgot's *Réflexions sur la formation et la distribution des richesses.* This appeared at Lemgo in 1775, under the title of *Untersuchungen über die Natur und den Ursprung der Reichthümer und ihrer Vertheilung unter den verschiedenen Gliedern der bürgerlichen Gesellschaft* (Enquiries into the nature and origin of Riches, and their distribution among the various members of Society). He came forward as a convinced adherent of the new doctrine in the *Sammlung von Aufsätzen über Gegenstände aus der Staatskunst, Staatswirthschaft und neuesten Staatengeschichte* (Collection of Essays on matters of Politics, Political Economy, and the most recent State-History), 1st vol. 1776, 2nd vol. 1777. Besides a number of economic treatises by foreign authors, including J. TUCKER'S *Four Tracts,* the work also contains an exhaustive essay by Mauvillon himself:—*Von der öffentlichen und privaten Ueppigkeit und den wahren Mitteln ihr zu steuern, nach den Grundsätzen der neueren französischen Physiokraten* (On Public and Private Luxury (*Luxe*), and the true means of checking it, according to the principles of the later French Physiocrats). This essay is remarkable, that in it for the first time, evidently borrowed from the French compilation "Physiocratie," by Du PONT (1768), the expression "physiocratic system" was employed for Quesnay's doctrine, and "Physiocratists" for his followers.[1] Mauvillon dedicated the book to C. W. Dohm, his colleague, at that time professor of cameralistic science at the Carolinum at Cassel, whose antagonism to the "physiocratic system" he knew, and whom he, in the dedication, invited to a rejoinder. Thence a literary conflict arose round the "physiocratic system," in which there took part, besides Dohm, who answered in a treatise published in the Deutsches Museum, *Kurze Darstellung des physiocratischen Systems* (Short explanation of the Physiocratic System) (1778), a large number of other political authors. (On this conflict, see article GERMAN SCHOOL OF POLITICAL ECONOMY.) In 1780, Mauvillon published a rejoinder, *Physiokratische Briefe an den Herrn Professor Dohm* (Physiocratic Letters to Professor Dohm). This is his principal work in economics.

Mauvillon is described by W. Roscher as intellectually the most important of the German physiocrats. That, however, is saying too much, since this position is undoubtedly due to SCHLETTWEIN (*q.v.*). Mauvillon acknowledges in the *Physiocratische Briefe* (Physiocratic Letters) themselves, that he has read but little of original physiocratic compositions. "There may thus perhaps be many things in my essays that are not entirely physiocratic, or that have not been said, or have been expressed differently, by the French economists. All that I desire is, that what I have said should be proved to be true. But if a name is needed, call it *Mauvillonish*" (p. 202). This "Mauvillonish" idea apparently causes him, in the treatise on "Luxury," to arrange the three social classes in such a manner that the landed gentry form a member of the productive class; but on the other hand besides the sterile unproductive class is made a special *salaried* class, composed of public officials, clergy, artists, and so forth. Mauvillon shares the full enthusiasm of the French physiocrats for their opinions. Quesnay's system is not to him like any other, that has advantages and disadvantages, but it is the only true system; it must, like virtue, be the best under all circumstances.—The co-operation of Mauvillon, in the work published by Count H. G. Mirabeau: *De la Monarchie Prussienne sous Frédéric le grand,* 1788, is well known. Mauvillon also published this work, some years afterwards, in German, under the title of *Von der Preussischen Monarchie unter Friedrich dem Grossen unter Leitung des Grafen von Mirabeau abgefasst und in deutsche Uebersetzung herausgegeben von J. Mauvillon Herzogt Braunschweigischen Oberstlieutenant* (On the Prussian Monarchy under Frederick the Great. Composed under the direction of Count Mirabeau, and published in German translation by J. Mauvillon, Lieutenant-Colonel of the Duchy of Brunswick), 1793. In the preface he describes his own share of the work as follows:—"Count Mirabeau really did not write this work, and the calumnious rage of his enemies and mine has compelled me to make this known. Only a few additions in the first and last books, and in the article on silk manufactures are by him. But to him, nevertheless, is mainly due the honour of the book, for he had conceived the idea of it, instilled it into me, gave me the means of accomplishing it, directed my work, and improved it very much after it left my hands." Mirabeau's *Lettres à un de ses amis en Allemagne, écrites durant les années 1786-90,* Brunswick, 1792, were addressed to Mauvillon, who published a German translation of them that same year.

Mauvillon also wrote several works on military science and history which, as remote from economic subjects, need not be noticed here.

[E. Leser, art. "Mauvillon" in the *Allgemeine Deutsche Biographie.*—W. Roscher, *Geschichte der Nationalokonomie in Deutschland* (History of National Economics in Germany).—Coquelin and Guillaumin, *Dictionnaire de l'Économie Politique,* art. "Mauvillon."] A. O.

[1] Du Pont has generally been regarded in economic literature as the originator of the expression "Physiocracy." In my edition of the *Oeuvres de Quesnay,* (Frankfurt A. M., 1888), I have, at p. 696 note, shown that this expression occurs half a year before the publication of Du Pont's work, in the *Ephémérides du Citoyen,* and indeed in an essay by the Abbé Baudeau. As Quesnay had, as editor, assisted in arranging the title-page of the *Physiocracy,* in which his writings are collected, I believed the authorship of the word belonged to Quesnay, and all the more because Du Pont himself had never claimed it. A. O.

MAXIMUM. See REVOLUTION, FRENCH.

MAXIMUM SATISFACTION is the object towards which the economic man strives; the MARGIN, which constitutes economic equilibrium. A great part of economic theory may be regarded as a statement of the conditions of maximum satisfaction (cp. Marshall's *Principles*, mathematical appendix, note xiv.). Thus the theory of market price—that the demand at that price should equal the supply at it (Mill, bk. iii. ch. 2)—may be deduced as the condition of the price for which the satisfaction of the buyers and sellers should be a maximum.

It is understood that this maximum is subject, or—as the mathematicians say, *relative*—to certain limitations. Thus, in a market, it is assumed that property passes only by exchange. It is not denied that an equalisation of property would—abstracting ulterior consequences—be productive of a greater sum total of utility than is produced by the play of the market under a regime of unequal property (Sidgwick's *Pol. Econ.*, bk. iii. ch. vii.; Jevons's *Theory*, 2nd ed. p. 153; Marshall's *Principles*, bk. v. ch. xii.).

It should be understood also that the *maximum* value of a function (see FUNCTIONS) is not necessarily the greatest possible value, but only the greatest of all values in the neighbourhood—a peak, but not the summit. There may be more *maxima* than one; and one *maximum* may be greater than another (Marshall, *loc. cit.* note). Accordingly, while it is true that any disturbance by which trade is shifted from an equilibrium to a neighbouring position, causes a diminution in the sum total of utility, it is also true that a disturbance, by which trade is shifted to the neighbourhood of a new equilibrium, may cause an increase in the sum total of utility. The latter kind of change is apt to occur when, by a stimulus to increased production, the advantages of production on a large scale are secured. Now it is quite conceivable that such a stimulus should be given by governmental interposition. Thus, while it is right to hold with Messrs. Auspitz and Lieben (*Theorie der Preise*, p. 425) and the classical economists, that a bounty causes a diminution in the sum total of utility, the organisation of industry being supposed unchanged; it is also right to hold with Professor Marshall that bounty, by bringing about a re-organisation of industry, may cause an increase in the sum total of utility.

Altogether, the doctrine that maximum satisfaction, or the greatest general good, is attained by exchange free from government intervention, is theoretically true in a much narrower sense than has been supposed by many publicists, and even by some theoretical economists. Its validity as a handy rule for practice is not denied.

[There is implied in the preceding argument a certain conception, which it is impossible here to express fully, concerning the modification of the law of supply—or SUPPLY-CURVES—which is involved in a re-organisation of industry, consequent on an enlarged scale of production. The view expressed on this subject by Mr. H. Cunynghame in the *Economic Journal* for March 1892 may be compared with the view expressed by Professor Edgeworth in the *Econ. Journal*, vol. iv. p. 436, and vol. xv. p. 62. In his *Mathematical Psychics*, he has pointed out analogies between the principle of maximum utility in economics and the principle of maximum energy in physics.] F. Y. E.

MAYOR, the annually-elected chief magistrate of a corporate town in England.

At the date of Domesday Book towns were governed by a *præpositus*, or reeve, and in many the payments due from the inhabitants to the king had been commuted for a fixed annual amount, the *firma burgi*, but there was, as yet, no municipal organisation unless the claims of London, set forth in the *Statement* addressed by the corporation to the city of London commission (1893), are historically valid. Under Henry I., however, London obtained by charter the election of its own sheriff, perhaps in place of the portreeve, and, in 1191, the citizens extorted the recognition of the *communa* they had long been trying to gain. This implied complete municipal self-government under a mayor, to the exclusion of all royal officers except the judges; but the *communa* must not be confounded with the merchant gild, from which it is essentially distinct in idea, though Glanville, in one passage, seems to treat the two as convertible terms. Indeed, it cannot be proved that London ever had a *gilda mercatoria*.

Henry Fitz-Alwyn, the first mayor of London, showed, in the affair of William Fitz-Osbert, that a corporation was not, in any modern sense, the champion of liberty; and in the year 1200, by purchasing a charter for the abolition of the ancient weavers' gild, the new municipality manifested a determination to control, without a rival, the trade and manufactures of the city.

The mayoralty of London is typical of the office in all other places, the charters of provincial towns frequently containing direct references to the customs of London as a standard. Some towns were allowed to have mayors at an early date—Leicester, for example, in 1208, but Norwich had no mayor until 1402.

The *Liber de Antiquis Legibus* assigns the date 1189 for Fitz-Alwyn's mayoralty, but not being a contemporary authority, its evidence must yield to that of Richard of Devizes and Benedict of Peterborough, who fix the year 1191 for the *communa*. Fitz-Alwyn held the office for life, and, in 1215, two years after his death, the king granted to the city the right of electing the mayor annually; but many of the subsequent mayors served for four or more years.

The customs of London were confirmed by

the 13th article of Magna Charta, and the high position of the mayor is shown by the fact that the *major de Lundoniis* was one of the twenty-five barons charged with carrying out the provisions of the charter.

A mediæval mayor played an active part in regulating the trade of his town. All questions arising from contracts between merchants, and all matters relating to apprentices, came before him, and he enforced the assize of measures, and the Assize of Bread and Beer. Wine, also, was tested by his authority, and the price of it might be fixed by his directions. All matters, too, relating to breaches of the regulations of the craft gilds were determined by him, and he thus gained a controlling influence over manufactures.

But more direct methods were not wanting, by which the mayor, with the advice, of course, of his council, settled matters which would now be left to the free bargaining of the parties concerned, and the *Liber Albus* of London may be consulted to show (pp. 289, 711, 712) that there was no hesitation about fixing the prices of meat, poultry, and fish, or the wages of carpenters, masons, and other workmen within the city, while on p. 418 of the same record may be read a document which is nothing less than a commercial treaty with Amiens and other towns.

An excellent idea of the position of a mayor in a provincial manufacturing town may be obtained from Blomefield's *History of Norfolk* (Norwich volume).

The history of the London mayoralty, from the reign of John, is the history of London itself, for which vast materials may be found in the records already quoted, and in the *Statutes of the Realm*. The mayor of London is supposed to have been first styled *Lord Mayor* in 1354, when the fourth charter of Edward III. gave him the honour of having gold or silver maces. He is summoned to sit and sign with the privy council the proclamation of a new sovereign. The mayor of Dublin, first appointed in 1409, was styled Lord Mayor by Charles II. in 1665, and the mayor of York has also for some time been entitled to the same special dignity, which recently was also conferred on the mayors of Belfast, Birmingham, Liverpool, and Manchester.

Mayors are now elected under the Municipal Corporations Act of 1882, 45 & 46 Vict. c. 50, from among "the aldermen, or councillors, or persons qualified to be such," on the 9th of November in each year, but the lord mayor of London is elected by the liverymen from the number of aldermen, the city of London not coming under the provisions of the above-mentioned statute. The chief functions of a modern mayor are to preside over the meetings of the council, to act as a justice of the peace for the borough, to act as returning officer at parliamentary and municipal elections, and to revise, with the aid of two assessors, the burgess lists when the borough is not represented in parliament.

[A. Pulling, *Laws, Customs, etc., of London*, 1854.—W. Maitland, *Hist. of London*, 1756.—Stubbs, *Constit. Hist.* and *Select Charters*.—James Thompson, *Essay on Eng. Municipal Hist.*, 1867.—H. A. MEAN is generally used in the same sense as Average. Some statisticians restrict the term to that species of average which is the centre of a group fulfilling the Law of Error (see Error, Law of). F. Y. E.

MEAN AFTERLIFETIME. This word was proposed by Dr. W. Farr (*q.v.*) to express what is often called the Expectation of Life, *i.e.* the calculated length of time that persons, in the aggregate, live. "The idea intended to be expressed by 'expectation of life' is the mean time which a number of persons at any moment of age will live after that moment: it is the French *vie moyenne*. And this technical idea is strictly and shortly expressed by *after-lifetime*, a pure English word, formed on the same analogy as *afterlife*." W. Farr, *Vital Statistics*, p. 478.

MEAN, ARITHMETICAL. See Average.

MEAN PRICES. See Prices.

MEANS, Method of. The method of means or averages is mainly directed to two purposes: (1) to ascertain an objective quantity, such as the stature of a certain man, by taking the mean of several fallible observations; (2) to find a so-called "subjective mean," such as the stature of the "mean man" (Quetelet) which may represent or typify the members of a species. Of these problems the latter kind is more frequent in the statistics with which political economy is concerned.

[See Average, and the references given under that head.] F. Y. E.

MEASURE OF VALUE. See Standard.

MEASURES AND WEIGHTS. The measures and weights here dealt with are those which were in use in this country during the five centuries after the Norman conquest. At the beginning of that period the various systems were beginning to emerge from a state of chaos, at the end they were, except for scientific definition, almost the same as now. During this time the units, which were destined to survive, were standardised; statute after statute was promulgated, ordering standards to be kept in various places for reference, and officers were appointed to examine and condemn false weights and measures. The immediate object of these acts was mainly fiscal, namely the prevention of the frauds on the customs revenue which were perpetrated by skilfully varying the size

of the customary measures. As an instance of this fraud may be quoted the chaldron of sea-coal which grew enormously in size through the imposition of a duty on each chaldron landed.

Some commodities were sold by number, and here it must be remembered that our ancestors counted by the score, not the hundred, the latter not meaning necessarily 5 score, but 5 score and 8, 5 score and 12, or 6 score, according to the locality and the nature of the articles enumerated. A thousand being 10 hundreds, might be and sometimes was 1200. A dicker was 10, a dozen generally 12, but a dozen of iron was 6 pieces; a bind of eels 10 sticks of 25 each; a bind of skins 30 timbres of 10 each; a hundred of garlics 15 ropes of 15 each; but a hundred of most things was 6 score, of horse shoes 5 score; a cade of red herrings was 6 hundreds, each of 6 score; a last of herrings 20 thousands.

Linear and area measures have not altered much since the 13th century. The table contained in *De admensuratione terræ* printed among the *Statutes of the Realm* as of uncertain date, but probably compiled about A.D. 1300, is, except for the omission of the land chains, exactly the same as our modern long measure and area measure. At the time of the compilation of Domesday Book, however, and for a considerable time after, the area of the acre seems to have varied locally, but the acre, rod, and furlong, although originally independent units, were already definitely related to each other; the length of the ordinary field in the direction of the furrows being a furlong, a field a rod wide was called a rod or rood and four roods made an acre. The yard at this time was not looked upon as a subdivision of the furlong, but was merely a cloth measure. The Roman measures—the mile, and the foot with its subdivisions, were unknown; the measure for long distances was the leuca of 12 quarentines or furlongs, which, however, in Domesday book was only used for measuring woodland. The two other Domesday units of land measurements, the HIDE and the carucate (see CARUCAGE), have long puzzled antiquaries. The hide seems to have been a unit for the assessment of taxation, not a true measure, although a hundred years later in the *Dialogus de Scaccario* it was stated to be 100 acres. The carucate was as much land as required one plough team, the bovate or oxgang being the share attributed to each beast, an eighth of a carucate if eight oxen made a team. These two units soon lost their meaning and became obsolete, the carucate first, the hide after. The first recorded attempt at standardising was that of Henry I. who ordered that the *ulna* or yard, hence called *ulna regis*, should be as long as his own arm. His example was followed by Richard I. and John, who caused standard yards to be made of iron. This yard was not the cloth yard, which does not seem to have been legally determined till the 14th century. Of miscellaneous measures of length and area may be mentioned—the solanda or double hide; solium, about 120 acres; virga or customary yard; tey, toise, or fathom of two yards.

The standard weight from the conquest till the time of Henry VIII. was troy weight. The troy pound seems to have been an arbitrary standard, although attempts were made to base it upon the weight of a grain of corn, by defining the pennyweight as the weight of 24 grains of wheat, and when it was found that this was not true, altering the number to 32. An old weight called the auncel was abolished by the statute of 25 Edward III. Although the legal pound was the troy pound, the merchants of the 15th century seem to have preferred a pound of 16 ounces; this pound was finally legalised by the act 24 Henry VIII. c. 3, where it is called *haber de payes;* it had already superseded the troy pound for most practical purposes. The most important table of weights in the middle ages was the wool weight.

7 lb. = 1 clove or nail, sometimes called great pound.	13 stone = 1 pocket or sarpler.
14 lb. = 1 stone.	16 stone = 1 pack.
2 stone = 1 tod.	26 stone = 1 sack.
12 stone = 1 wey.	12 sacks = 1 last.

A load varied from 168 to 175 stone. Although this was the table ultimately established by law, it was actually subject to great local variations. The clove or nail was often 8 lb. The stone varied locally from 7 lb. to 20 lb., and a long string of statutes did not succeed in making it uniform. The same remark applies to the sack. A weight called *pondus* was sometimes used and seems to have been about 20 lb.

For butter—

3 lb. = 1 quart.
2 quarts = 1 pottle.
7 or 8 lb. = 1 clove.
14 lb. = 1 pot.
56 lb. = 1 firkin.
112 lb. = 1 kilderkin.

The stone or petra of lead was 14 lb.

5 stone made a pig, pes, formel, fodmael or fontinellus.

30 pigs made a charrus, carecta, or plaustrata, which weight, however, seems not to have been distinguished from the fother of 19 hundreds of 108 lb. each.

The following were the most common miscellaneous weights.

The bundle or garb of steel contained 30 pieces, and 25 pieces made a hundred of 108 lb., the bundle was also used for vetches, etc.

Mark of gold or silver = ⅔ of a troy pound.

Quintal of iron contained from 96 lb. to 120 lb.

Seem or sum of glass was 20 stone of 5 lb. each.

Wey of cheese was by statute 224 lb., but varied locally from 168 lb., *i.e.* 6 quarters, to 300 lb.

Wey of barley, malt, or tallow was 6 quarters or 108 lb.
Wey of salt, 25 quarters.

The table of corn measures which can be drawn up from 14th century accounts is identical with that now in use. There was, however, in use till the reign of Edward III. a bushel of 9 gallons (or 2145 oz.), which only became obsolete after being declared illegal by numerous statutes. The first attempt to combine weights and measures into one system seems to have been made by the act of 12 Henry VII. c. 5 which declared that the gallon of wheat was to contain 8 lb. troy. There were a great number of customary dry measures; the following list omits those of which the name only is known.

Boll = 6 bushels.
Butt of salmon = 84 gallons.
Cade of tar = 12 gallons.
Celdra or chaldron of sea-coal or oats = 4½ quarters, but the coal chaldron varied considerably at different dates.
Cipha or sieve = about 5 quarters.
Coomb of east coast or ring of Huntingdonshire = ½ quarter.
Crannock (Irish) of oats = 16 bushels.
Last = 80 bushels of corn or 12 barrels of fish.
Load, seem, or sum = 6 or 8 bushels, or 12 trugg, but a sum of oats was 24 trugg or 2 quarters.
Mitta or met of salt = 2 bushels.
Pottle of butter = 2 quarts (*v.s.* under weights).
Strike = ½ quarter.
Windle of nuts, a Cumberland measure, was a bushel.

A measure called "water-measure" was in use in the 15th century containing 5 pecks; it was originally legalised for use on board ship, and continued to be used for fruit till modern times.

The liquid measures did not become important till the development of the wine trade in the 14th and 15th centuries, when a great number of strange measures were introduced from abroad. The barrel was a very variable quantity, almost every liquid having a different standard. The following wine measures were defined by statutes 2 Henry VI. c. 14, Richard III. c. 13, and 23 Henry VIII., viz.: tun, 252 gallons; pipe or butt of Malmsey, 126; tertian or puncheon, 84; hogshead, 63; tierce, 41; barrel, 31½; and runlet, 18½ gallons.

It must be remembered that, in dealing with any set of mediæval accounts, the equivalent of the various weights and measures given above must only be used as a rough approximation, to be verified or corrected by collating a number of accounts of the same place and date.

A. E. S.

MECHANICS OF INDUSTRY. Just as all the physical sciences have their basis in the general principles of the abstract science of statical mechanics—the same primary laws of motion governing phenomena, whether of solids, liquids, or gases—so, according to JEVONS, does the structure of economic science, in all its branches, rest on an abstract theory of political economy, which concerns itself only with general laws, simple in nature, and deeply grounded in the constitution of man and the outer world, and which he designates "the mechanics of self-interest and utility" (*Theory of Political Economy*, 2nd ed. 1879, pref. xvii.-xviii., p. 23; art. on "The Future of Political Economy" in *Fortnightly Review*, November 1876, vol. xx. N.S., pp. 624-626). This, he says, "is entirely based on a calculus of pleasure and pain" (*Theory*, p. 25; cp. pref. vii.). For just as the theory of statics rests on "the equality of indefinitely small amounts of energy," so here economic phenomena are "explained by the consideration of indefinitely small amounts of pleasure and pain" (*ib. loc. cit.*); and the laws of exchange-value "are found to resemble the laws of equilibrium of a lever as determined by the principle of virtual velocities" (*ib. loc. cit.*, also ch. iv., see EQUILIBRIUM). Similarly, in the work of Professor Marshall (*Principles of Economics*, vol. i. 2nd ed. 1891), in which VALUE (*q.v.*) is recognised as the central idea in economics, the whole structure is at once seen to rest on the balancing of indefinitely small increments of utility against the corresponding increments of disutility (see DISCOMMODITY; FINAL DEGREE OF UTILITY). Still the theory of UTILITY, which results from the conception of "a calculus of pleasure and pain," is, as Dr. Keynes insists, rightly to be regarded as an essential premiss rather than as an integral portion of economic science (cp. *Scope and Method of Political Economy*, 1904, p. 91. n.).

A. B. C.

Dr. Irving Fisher in his *Mathematical Investigations in the Theory of Value and Prices*, has a good chapter on "Mechanical Analogies." Of these the most essential appears to be the analogy between mechanical equilibrium considered as a position of maximum energy, "where the impelling and resisting forces along each axis will be equal," and economic equilibrium considered as a position of maximum TOTAL UTILITY, "where the marginal utility and marginal disutility along each axis [each branch of production or consumption] will be equal." So in Prof. Edgeworth's *Mathematical Psychics*, pt. i. § 2, there is considered the analogy between the first principles of economics and "those principles of maximum energy which are among the highest generalisations of physics, and in virtue of which mathematical

reasoning is applicable to physical phenomena quite as complex as human life." Professor Marshall too has indicated that all the conditions of economic equilibrium may be comprehended in the one condition that the total utility or net advantages should be a maximum (*Principles of Economics*, Mathematical Appendix, 2nd ed., note xiv.). But in his third edition (*ibid.* note xiii.) he appears to shrink from the wider applications of this principle to "every field of economics." . . . "Such discussions have their place, but not in a treatise like the present."

MEDIA ANATA, a tax of 50 per cent on the amount of their salary, which, from the time of Philip IV., was levied on all Spanish officials during the first year of their appointment. E. Ca.

MEDIÆVAL FAIRS. The great continental fairs are one of the prominent characteristics of mediæval mercantile life, and the part they took in the development of international commerce and mercantile law is of conspicuous importance. Their origin must be ascribed to the great religious festivals which attracted large numbers of people to certain places at fixed periods, and therefore created exceptional opportunities for mercantile intercourse; this explains their names ("fair" and "foire"—derived from "ferial"; "messe" = "mass"), and also the special protection which was given to their frequenters. The records of some of them, as, for instance, the fair of St. Denis in Paris, go back to the 7th century, but the time of their fullest development is reached in the 12th century, when the six fairs of the Champagne country were successively held at Provins, Troyes, Bar, and Lagny, at periods extending over the whole year, and were frequented by merchants coming from France, Italy, Spain, Savoy, and Switzerland, Flanders and Brabant, England and Germany. These merchants enjoyed numerous privileges; they were under the protection of the counts of Champagne, not only while they were taking part in the fair, but also on their way to the same, and on their homeward journey (*conductus nundinarum*), which, at a time when the plundering of traders was a regular source of income for the noble inhabitants of the castles near which their roads passed, was a considerable advantage, and they could not be arrested for debts previously incurred. On the other hand, claims arising from debts incurred at the fair were specially privileged both as regards procedure and priority.

A special "fair" tribunal was established, which had exclusive jurisdiction in respect of all transactions entered into at the fair, and in the case of persons returning to their houses without paying their debts, had power to issue a writ requiring the court of the place in which the defaulter was resident, to proceed against him. If such requisition was not complied with, the city or country to which the court belonged was placed under "interdict," which involved an exclusion of all its citizens from the privileges of the fair.

Being the great international meeting-places, these fairs offered exceptional opportunities for all money-changing transactions; and on the other hand, the coins issued in Champagne were largely used for international payments; hence the expression "troy" weight = weight of Troyes.

Promissory notes and bills of exchange payable at the fairs were convenient remittances in all mercantile countries, and the bankers who frequented the fairs seem to have established a regular system of clearing among themselves. Thus it was that not only through the interchange of goods, but also through personal contact, a feeling of community of interests was established among traders of all nations which could not fail to have a civilising influence in all countries. A uniformity of prices and mercantile customs was established to the great advantage of the general public, and the facility for the enforcement of debts and mercantile engagements generally by means of the extensive powers of a central tribunal, fostered trade by diminishing its risks.

Through local causes, the fairs of the Champagne began to decay in the middle of the 14th century, and some time afterwards those of Lyons began to assume an increased importance, which reached its climax in the 17th century. At the same time the fairs in Germany, especially the one at Frankfort-on-the-Main, began to develop, without however at any time attaining the international importance of the French ones. The Leipzig fair obtained pre-eminence in the 18th, and had great importance throughout the present century, but it has now ceased to exercise any material influence. The great fair of Nijni Novgorod in Russia is likewise failing.

[The information given above is mostly derived from Goldschmidt, *Universalgeschichte des Handelsrechts*, a book full of interesting economical information. See also the numerous authorities quoted by Goldschmidt, especially:—Bourquelot, *Études sur les foires de Champagne;* see also Dr. Rathgen's article: *Märkte und Messen* in Conrad's *Handwörterbuch*, and the authorities mentioned therein; article "Foire" by Turgot, in *Encyclopédie* of Diderot and D'Alembert; see also MARKET.]

E. S.

MEDICI, THE. Though Florence was long shut out from unrestricted access to the sea, her trade and industry early exceeded those of towns such as Pisa and Lucca, which had the command of ports. The feudal aristocracy was overthrown by the industrial classes; the nobles were compelled to live within the walls and to submit to republican rule; and their repeated

attempts to recover their former ascendency never succeeded for any length of time. The commonwealth rested essentially on commerce and the arts. The population, for political as for other purposes, was regimented in trade gilds; associations of this kind had long existed, but they received their definitive organisation only in the latter part of the 13th century. Their number, after several changes, was fixed at twenty-one—seven greater and fourteen lesser. The most important industries were represented by the greater gilds, especially by the cloth-weavers, or Calimala,[1] the silk-weavers, and the money-changers. The wools of Italy were coarse, from the neglected condition of pasturage, as of agriculture generally; and the cloth-weavers imported wool from France, Flanders, Spain, and Portugal, England, and Scotland. The manufacturers of the Calimala were forbidden by statute to deal in home-made cloths; they imported the foreign fabrics made from the finer wools of Flanders, Holland, and Brabant; these they dyed and dressed, and then sold, at first in Italy and the East, and at a later period in France and England, and even in the countries from which, in the undressed state, they had been brought. Many of these manufacturers were members of distinguished families whose names often recur in the history of Florence. The silk-weavers were already numerous in the early part of the 13th century, and rose to greater importance when the cloth manufacture declined in consequence of the growth of the corresponding crafts amongst the Flemish, French, and English, which sought to exclude the Italian wares. But money-changing was the business which was the chief source of the wealth of the city. The origin of bills of exchange, placed in 1199, has been attributed to the Florentines; the commerce of Florence at least greatly extended their use. Banking was more flourishing there than in any other centre at the opening of the 13th century. In that century the Florentines had monetary dealings with Henry III. of England, and conducted the financial affairs of the holy see, which they long continued to manage to their great profit. Notwithstanding several reverses, arising from the action of the French and English sovereigns, the Florentine banks were numerous and powerful at the beginning of the 15th century. The Medici, the Bardi, the Acciajuoli, the Buonacorsi, and other great Florentine houses, had agents or branch establishments in London, Bruges, Paris, Lyons, Avignon, and Marseilles, besides those at Rome, Genoa, and Naples. In 1422 seventy-two exchange houses and tables are said to have existed at Florence in the *Mercato Nuovo* or its vicinity. The Florentine merchants of the period were notable, not merely for ability as men of business, but for personal dignity, public spirit, munificence, and patronage of art, to a degree not equalled by those of any other country; and of this combination of qualities several of the Medici presented eminent examples.

The Medici family first appears about the end of the 12th century. Giovanni de' Medici was a leader of an armed expedition of Florentines in 1251, and another member of the family took part in the expulsion of Walter de Brienne in 1342. They put themselves at the head of the *popolani grassi*, or superior trading classes, composing the greater gilds, who wrested the supremacy from the nobles in 1344. But the founders of the greatness of the family were Salvestro, and Giovanni surnamed di Bicci. Salvestro, who was gonfalonier in 1378, led a popular movement against the tyranny and proscriptions of the Albizzi. His son Veri was averse to public life, and devoted himself to commerce, which had already enriched the family. The defence of popular interests against the aristocracy became the hereditary policy of the Medici, and was effectively maintained by Giovanni di Bicci, who belonged to a different branch from Salvestro. Born in 1360, he inherited great wealth from his father Averardo, which he increased by his own ability, diligence, and prudence. In the register of property, 1427-1430, for purposes of taxation, Giovanni was second in the list of contributors. He had business relations, not only with the other Italian states, but with France and Flanders. All the great monetary affairs of Italy were transacted by him, notably those of Pope John XXIII. He expended largely from his private resources on public objects. As a politician his efforts were steadily directed to appeasing the enmities of classes and maintaining the internal peace of the republic. Giovanni's eldest son was Cosmo (1389-1464). He followed in the footsteps of his father. As a merchant he was skilful and successful. He had banks in all the countries of the west and was ruler of the European money-market. The agents who conducted his foreign speculations shared his prosperity; and hence, as Machiavelli informs us, originated many enormous fortunes in the hands of Florentines, as in the cases of the Tornabuoni, the Benci, the Portinari, and the Sassetti. His great profits from banking, trade, and farming, added to his inherited property, enabled him to spend large sums in the erection of churches and convents, as well as on his own household and social expenses, which latter, however, he restricted within prudent limits, thus avoiding public prejudice. The loans which he made to the state and to private citizens established his popularity, and, after his temporary fall and brief exile, were amongst the solid foundations of the power which he retained without interruption to the end of his life. He guided his political party amidst great difficulties with consummate skill, and conciliated opinion by his uniform courtesy

[1] "The term seems to have been taken from the name of the street in which the guild is situated. The street led to a house of ill-fame; hence the name *Callis Malus*, in the sense of *Via Mala*, evil road or lane."—*Villari*.

and his freedom from ostentation. Though practically the supreme director of the state, he assumed the manners rather of the first citizen of Florence than of its dictator. He did much for the furtherance of learning and art; and, on the whole, well deserved the title of *Pater Patriæ*, which by public decree was inscribed above his tomb.

Some members of the liberal school of the present century, who habitually exalted what they vaguely called liberty above good government, have spoken in a hostile, or at least a grudging, spirit, of the early Medici, because, from circumstances much less dependent on their personal efforts than on the condition of Florence in their times, the administration of the state came into their hands. But Voltaire has justly said that there never was a family whose power rested on more legitimate grounds, and it would be difficult to find, in the period to which he belonged, a nobler type than that of Cosmo.

His son Piero (1416-1469) was an excellent and highly esteemed citizen, but much inferior to his father in political acuteness and practical sagacity; and his grandson Lorenzo "the Magnificent" (1448-1492), though a brilliant and imposing figure, did not approach at all so nearly as Cosmo to the ideal of the chief of an industrial republic. As the Medici took more and more upon them the character of princes, they "forgot to be merchants." Their agents often neglected or mismanaged their affairs; and the commercial wealth of the family became completely dilapidated. Piero is thought to have seriously injured their political influence by demanding back loans which his father had made to many private persons—a proceeding which led to the insolvency of a number of merchants. But the failing resources of the Medici were largely supplemented out of the revenues of the state; and the republic, by diminishing the interest on the public debt and by other expedients, as Hallam says, "screened their bankruptcy by its own."

The later Medici cannot be followed here; they were no longer engaged in commerce, and in their political action did not rise above the other Italian rulers of their times.

[Machiavelli, *History of Florence.*—Guicciardini, *History of Florence.*—A. von Reumont, *Lorenzo de' Medici*, English translation by R. Harrison, 1876.—Pasquale Villari, *Two First Centuries of Florentine History*, English translation by Linda Villari, 1894.] J. K. I.

MEDINA, FRAY JUAN DE (lived towards the middle of the 16th century), was a Benedictine monk, and became the abbot of the monastery of this order in Salamanca. On the occasion of the regulations proposed by the government of Castile against the swarms of professional beggars who infested the country, a Dominican monk, fray Domingo de Soto, in his *Deliberatio in causa Pauperum* (Salamanca, 1545), had maintained their natural right to beg, and to pass from poor and destitute regions to other and richer parts of the monarchy. In his treatise entitled *De la órden que en algunos pueblos de España se ha puesto en la limosna para el remedio de los verdaderos pobres* (On the Regulation of Almsgiving for the Remedy of the Real Poor), also printed in Salamanca in 1545, by the same printer and reprinted in Valladolid in 1757 under the new title of *La Caridad discreta con los Mendigos*, Medina asserts the right and the obligation of the local authorities to provide for the wants of their own and honest poor, and to expel, without mercy, all shameless and able-bodied beggars strangers to the locality. "Justice must temper mercy, and almsgiving must be dealt with in an unambiguous way."

[The debate between the two reverend antagonists is very clearly summarised by Don Manuel Colmeiro in his *Hist. Ec. de España*, vol. ii. pp. 34-36.] E. Ca.

MEDIUM OF EXCHANGE. See MONEY.

MEDJIDIE. Two Turkish coins bear the name Medjidie (after the Sultan Abdul Medjid); the gold medjidie, or Turkish pound, and the silver 20-piastre piece. The gold medjidie, of 100 piastres, is a coin weighing 111·366 grains of gold of the millesimal fineness of 916·6̇, and is equivalent in sterling value to 18s. $0\frac{3}{4}$d. or to 22·78 francs of French standard gold, $\frac{9}{10}$ fine. The silver medjidie is a token coin weighing 371·22 grains, with a millesimal fineness of 830. F. E. A.

MEEK, Sir JAMES (1778-1856), was appointed in 1830 comptroller of the victualling and transport services at the admiralty. In 1841 he visited various foreign ports and cities to collect information as to the cost and supply of agricultural produce, etc. His report, which was printed by order of the House of Commons (*Parliamentary Papers*, House of Commons, 1842, vol. xl. No. 7), contained a mass of information, arranged in a tabulated form. It was of much service to Sir R. Peel in the preparation of his free-trade measure of 1846.

[*Dictionary of National Biography*, vol. xxxvii. p. 209.] H. E. E.

MEES, WILLEM CORNELIS (1813-85), was born at Rotterdam. He studied law at Utrecht, 1830-38, practised as a lawyer at Rotterdam (1838-47), where in 1843 he was also appointed secretary of the chamber of commerce. In 1849 he became secretary of the Netherland Bank, and 1863 president, which post he continued to hold until his death. Before he took his degree he wrote *Proeve eener Geschiedenis van het Bankwezen in Nederland* (History of the Banking System in Netherland), Rotterdam, 1838. His academical dissertation was entitled: *De vi mutatae monetae in solutionem pecuniae debitae.*

He also wrote the following works on economics:—*De Werkinrichtingen voor Armen uit een staathuishoudkundig oogpunt beschouwd* (The Workhouses for the Poor, from an Economic Point of View), 1844; *Het Muntwezen*

van Nederlandsch Indië (The Currency System of Dutch India), Amsterdam, 1851; *Overzecht van enige Hoofdstukken der Staathuishoudkunde* (Leading Chapters of Political Economy), Amsterdam, 1866. Of several speeches delivered in the Royal Academy of Sciences, the following are the most remarkable:—(*a*) *De Muntstandaard in verband met de pogingen tot invoering van eenheid van Munt* (The Standard of Currency, in Relation to the Efforts to Institute Unity of Currency); (*b*) *Opmerkingen omtrent gelijke verdeeling van Belasting* (Remarks on an Equal Division of Taxes); (*c*) *Poging tot verduidelijking van eenige begrippen in de Staathuishoudkunde* (An Attempt to give General Information on Political Economy).

Mees was essentially a man of science, and a very correct thinker on economical subjects. He generally agreed with the doctrines of Ricardo and Malthus. Intellectual and moral development was considered the best means for improving society. His *Chapters* is a very remarkable book, tending especially to set forth the connection between the rate of interest and the rate of wages, and the bearing of both on prices. The *History of Banking* is very complete.[1] He was a bimetallist by conviction; he advocated this system not only in his writings, but also at the Paris monetary conferences of 1867-68 as a delegate of the Dutch government. It may be claimed for him that he was one of the first who sought to place the doctrines of bimetallism on a scientific basis. As secretary and president of the Netherland Bank he gained great reputation; his management of that institution was greatly admired, and he largely contributed to its extension and improvement. A. F. v. L.

MEETING, Company. The Companies Act 1862 makes it obligatory for every company incorporated under its provisions (§ 49) to hold once a year at least a general meeting. Minutes of all resolutions and proceedings must be entered in the proper books (§ 67), and, under Companies Act 1900, § 12, a first (statutory) meeting must be held within a prescribed period. The articles usually provide for one general meeting to be held at a certain date each year, to be called the "ordinary" general meeting of the company, power being given to the directors and a certain number of shareholders to convene "extraordinary" special meetings. (See Table A., art. 29-34.) E. S.

MELANCHTHON, Philip (1497-1560), like Luther (*q.v.*) and the other Reformers, dealt freely and at length with the economic topics of the time in his sermons and other writings. In his general attitude, as we might expect, he resembled Luther; but his less passionate temperament, and his more scholastic learning show themselves in several matters. Especially was this the case in regard to the burning question of usury (see Interest and Usury). He follows the later canonists in approving of each of the three methods, and these in their most liberal form, by which a profitable investment was sought for capital,—the purchase of rent charges (*Census, Zinskauf*), partnership, and "interest" in its earlier sense. In the case of the last, while abiding by the old principles that the lender must lose a real opportunity of profit to have a just claim for recompense, and that the compensation must be reasonable, he took the decisive step of distinctly maintaining that compensation could justly be bargained for to run from the moment of the loan, and not simply on account of "Mora," or delay in repayment after an appointed time. See also Navarrus de Azpilcueta.

[Citations from his *Dissertatio de Contractibus*, and other works will be found in H. Wiskemann, *Darstellung* (1861), etc., and in G. Schmoller, *Zur Geschichte*, etc. (1861).—For an account in English see Ashley, *Economic History*, i. pt. ii. p. 457.] W. J. A.

MELON, Jean François (16——1738), born at Tulle, died at Paris. Originally practising as a lawyer at Bordeaux, he became in 1712 the paid secretary of a literary society, and then was appointed to the financial council established at Paris on the death of Louis XIV. He was then employed by D'Argenson and appointed inspector-general of *fermes* at Bordeaux. Afterwards he became the secretary of John Law, with whom he remained until the *Système* ceased to exist. Thence he passed into the service of the regent. At the death of the Duke of Orleans (1723) he returned to private life.

These successive occupations show a variety of ability which explains the welcome given by Melon's contemporaries to his *Essai politique sur le Commerce* (editions in 1734, 1736, 1742, 1761), and the influence he exercised in his time. The writings of Melon influenced Dutot (1738), and the writings of the latter gave the tone to Paris Duverney (1740). The "inside" account of the *système* of J. Law, which Melon gives, is important. He favoured slavery in the colonies, the mercantile system, and the balance of commerce; but he did not support a protective system as at present understood, and was aware that the interest of the consumer precedes that of the producer. He shows a mind which might have been favourably influenced by Quesnay and Adam Smith, had he lived half a century later.

Guillaumin's collection (*Économistes Financiers du XVIII^e siècle*, 1843) contains his *Essai politique sur le Commerce* as well as the *Réflexions politiques sur les Finances et le Commerce*.

[See reference to Melon—Hume, *Essays*, No. I., *on Commerce*—as to occupations of population in France, and in note Q, in which Melon's opinions are criticised. Turgot thought Melon eclipsed by Montesquieu and others, including Quesnay. *Œuvres*, ed. Daire, v. ii.] A. C. f.

[1] It clears up much on the history of the Netherlands Bank, misunderstood by A. Smith.

MEMORANDUM OF ASSOCIATION. Certain particulars respecting a company to be formed under the Companies Acts must be embodied in a document signed by at least seven members of the company, which document is called the memorandum of association. In the case of a company limited by shares, the required particulars are (1) the name of the proposed company; (2) a statement as to whether the registered office of the company is in England, Scotland, or Ireland; (3) the objects for which the company is to be established; (4) a declaration that the liability of the members is to be limited; (5) the amount of capital, and the number of shares into which it is to be divided. The directions as to the rights and duties of shareholders and directors, and as to the manner in which business is to be carried on, are generally given by a separate instrument, the name of which is "articles of association," but which, in the case of a company limited by shares and willing to abide by the regulations laid down by "Table A" (in the schedule to the act of 1862), is not required. A great difference between the memorandum and articles arises from the fact that the latter can at any time be altered by special resolutions, whilst the former cannot be altered even by the unanimous vote of the shareholders, except subject to certain conditions and restrictions. Before 1890 the only alteration which was permissible was an increase of the capital of a company limited by shares, but the Companies (Memorandum of Association) Act, 1890, provides that, subject to the consent of the court, and to the compliance with certain formalities, alterations, as regards the objects of the company, may be made if it appears that they are required in order to enable the company (*a*) to carry on its business more economically or more efficiently; (*b*) to attain its main purpose by new or improved means; (*c*) to enlarge or change the local area of its operations; (*d*) to carry on some business which may conveniently be combined with the former business; (*e*) to restrict or abandon any of the objects specified in the memorandum.

If any alterations are required which cannot be effected in the above-mentioned manner, a reconstruction of the company becomes necessary.

[Palmer, *Company Law*, 5th ed. 1905.]

E. S.

MENDICITY. Mendicity differs in character in different countries and at various times, but it everywhere embodies two ideas, viz. living at the cost of others, and wandering from place to place in search of the means of subsistence. In ancient Greece the mendicant was a familiar figure, he was tolerated if not encouraged, as witness the combat between Odysseus and Irus, for the post of "gaberlunzie" in Ithaca. In Rome mendicancy was common and was not forbidden by law, though in the later days of the empire repressive measures were adopted. The early days of Christianity were marked by an absence of the mendicant class, but it soon began to grow, and the laws of Justinian on the subject were necessitated by the halo of sanctity with which the church at times surrounded the beggar. In this country, the attitude of the ruling power towards mendicancy has varied greatly. The 14th century saw a series of acts passed, each more stringent than the last, on this subject. Sturdy beggars were to be put in the stocks, sent to gaol, and generally treated as a public nuisance, and with great wisdom the act of 1349 punished with imprisonment those who gave to such. But the law was almost powerless in the face of the encouragement which the beggar found at the religious houses throughout the country, and in the countless forms of indiscriminate charity. There is ground for thinking that mendicancy flourished during the 15th century, and it was only towards the middle and end of the 16th that measures against it were enforced, possibly in part owing to the sounder teaching of the reformers on the subject. Then we find Southampton ordering that beggars should have their hair cut, and parliament decreeing punishment in a progressive scale of severity. Whipping, branding, cutting off the gristle of the ear, even death, were the penalties assigned; whilst a loophole, so to say, was given by the provision which empowered the granting of licenses to beg. Lastly, in 1576 it was enacted that houses of correction should be provided in which the unemployed, who were generally vagrants, should be set to work. The end of the century saw a considerable abatement of the evil. From 1601 onwards the treatment of mendicancy has been a part of the general poor-law system of England. But the "rogue and vagabond" is the despair of the framers of acts for the relief of the poor, and dealing with settlement. Thus a consolidating act of 1713 lays it down that any person wandering about the country on any one of a long list of pretences is to be summarily arrested and removed to his settlement, or if he have none, to be dealt with by the poor-law authorities of the parish in which he is apprehended, but previously he may be flogged or set to hard labour, or committed for seven years to the custody of any person who will undertake to set him to work in Great Britain or the colonies. By the act of 1744 even women are to be flogged for vagrancy, and as late as 1824 flogging is retained as the appropriate punishment for "incorrigible rogues."

Under the new poor law of 1834 the vagrant was not distinguished from the ordinary pauper. Admission to a workhouse was a right enjoyed by all the destitute alike, with a corresponding freedom of discharge. Hence the vagrant found

in the workhouse a convenient and cheap resting place. This led to the provision of 1842, by which the guardians were empowered to prescribe a task of work to be done before he quitted the workhouse, and punishment for neglect to do it. By the act of 1871 he was to be detained till 11 o'clock, and if he reappeared at the same workhouse twice in a month, he was liable to detention till 9 A.M. on the third day after his admission. Special provision is now made for him in accommodation and diet. The number of casuals relieved on the night of July 1, 1905, was 8556. But mendicancy cannot be solved by act of Parliament. The legislature may provide for the treatment of "casuals," and make begging a crime, but such preventive measures will only be effective so far as they are supported by public opinion. The ordinary man feels compunction in "giving a beggar in charge," he has a certain sympathy with him, he lends a willing ear to his sad tale, he shirks the trouble of inquiry, he too often believes him. And so long as the demand for beggars in this shape continues, so long will the supply be forthcoming. Mendicancy takes many forms: the travelling hawker, duly furnished with a police license, the wandering musician, are in reality mendicants, for the sums they receive are out of all proportion to the services they render. The life of the mendicant has attractions of its own, as shown by the character of Edie Ochiltree in Scott's *Antiquary*, and the disinclination of mendicants to accept an offer of regular employment. Attempts to provide such employment are not wanting, they are seen in the work of the Salvation Army and the labour homes of the Church Army. In the same spirit philanthropists in Holland and Germany have founded INDUSTRIAL COLONIES (*q.v.*) in which vagrants may be gradually trained in the ways of regular and civilised living.

[For early and mediæval mendicancy, W. J. Ashley, *Economic History*, vol. i. pt. 2, ch. v., giving list of authorities; for English mendicancy, C. J. Ribton James, *History of Vagrants;* for the attitude of the legislature, Nicholls, *History of the Poor Law*, and Aschrott, *The English Poor Law System*. MENGOTTI, FRANCESCO (1749-1830). An economist and statistician, born near Feltre (Belluno). He was appointed in 1806 president of the general administration of finance in the Venetian provinces, and afterwards held the same post at Ancona; he was a senator in the first kingdom of Italy. When the Austrians returned into Italy, Mengotti became a councillor of the Venetian government, and vice-president of the board of taxation in Milan, where he died.

His best-known work is on *Commerce*, called by him "Colbertism" from Colbert. This was a prize subject, set in 1791, by the "Accademia dei Georgofili" at Florence, and the prize was adjudged to Mengotti's paper. In this essay the writer endeavours to reconcile the MERCANTILE SYSTEM and the doctrines of the PHYSIOCRATS. He advocates free competition, and suggests the measures necessary for the adoption of free exchange. He, however, commits the error of attributing the origin of mercantilism to Colbert, who, while he frequently experimented in and applied its methods in France, was not its inventor. Mengotti's style is pleasing; his work had great success, and went through several editions.

Mengotti also wrote an essay (1787) on the commerce of the Romans, which obtained a prize at the Academy of Inscriptions in Paris. In this work the author maintains the theory that the Romans did not understand the importance of trade, that they thought only of enriching themselves with the spoils of every nation, and that their sole commerce was that of transporting into Italy all the riches of the countries they had conquered. Finally, Mengotti wrote a work on treasuries and public loans.

Del commercio dei Romani dalla prima guerra punica a Costantino, dissertazione, 1787. —*Il Colbertismo, dissertazione*, Florence, 1792.—*Se sia piu saggio il sistema degli antichi di avere un tesoro ovvero quello dei moderni di fare degli imprestiti per sovvenire di pubblici bisogni*, 1828.

MENIER, ÉMILE JUSTIN (1826-1881), a great French chocolate manufacturer and a member of the house of deputies.

Author of: *Théorie et Applications de l'Impôt sur le Capital*, 1874; *L'Avenir Économique*, 2 vols., 1875 and 1879; *La Réforme Fiscale;* and *Les Travaux de Paris par l'Impôt sur le Capital;* —made himself prominent as an indefatigable advocate of the taxation of fixed capital, and the immunity of circulating capital from all taxes.

E. Ca.

MENSARIUS. In a general sense *mensarius* (cp. *trapezita* in Plautus) means a banker or a money-changer, and if it was not originally the precise equivalent of *argentarius* (see ARGENTARII) it probably became so in the closing days of the Roman republic, for Suetonius (*Augustus*, 2 and 4) in one passage applies the term *argentarius* to the grandfather of Augustus, and in another describes him in the same sentence as *nummularius* and *mensarius*, two words which Festus shows are equivalent by explaining one by the other. But these words may conceivably have denoted different aspects of his business. Livy (vii. 21) supplies a safer clue in the passage: *quinqueviris creatis, quos mensarios ab dispensatione pecuniæ appellarunt;* and again, (xxvi. 36) *argentum, æs signatum, ad triumviros mensarios referamus.* From these words it appears probable that *mensarii* were bankers in

an especially public sense, and controlled the payments and loans made from public money; but the matter is one upon which opposite views have been held by scholars.

[Smith, *Dict. of Greek and Roman Antiquities.* —Mommsen, *Hist. of Rome*, 1894, ii. pp. 86, 343, iii. 83.—Deloumie, *Les Manieurs d'argent à Rome.*]

R. H.

MERCANTILE SYSTEM. By the mercantile system we mean the economic policy of Europe from the break-up of the mediæval organisation of industry and commerce to the dominance of the system of LAISSEZ-FAIRE (*q.v.*). Strictly speaking, there is only one country, viz. England, in which the mercantile system can be studied in all its phases. In other European countries the growth of the system of *laissez-faire* has been arrested, or a revival of mercantilism has taken place, from various causes, such as the creation of the German empire, and increased military expenditure. It is conceivable also that even so far as England is concerned there might be some return to mercantilist principles if a definite attempt were made to carry into effect a scheme of imperial federation. The object of the mercantile system was the creation of an industrial and commercial state in which, by encouragement or restraint imposed by the sovereign authority, private and sectional interests should be made to promote national strength and independence. Writers of the mercantilist school regarded political economy as a branch of the science of statesmanship, and, unlike the early advocates of *laissez-faire*, held that private interests did not necessarily, or even usually, coincide with the interests of the community. There are many points of resemblance between the mercantile system and state socialism (see SOCIALISM). An organised industrial and commercial state is an ideal common to both, and many of the measures adopted under the former would no doubt reappear if any considerable approach to the latter took place. But they differ in the ultimate end proposed. The object of the one was national self-sufficiency; of the other, it is the improvement of the lot of the wage-earners. The mercantile system involved regulation and control by the central authority, but not necessarily the imposition of protective duties. Thomas MUN (*q.v.*), its principal English exponent, admits cases in which free importation or exportation is desirable, and many of the early writers regard with great approval the "lowness of customs" imposed by the Dutch republic. Whether, on the principles of the mercantile system, a duty should be imposed or not, would depend upon the relation of the industry or trade concerned to the general economy of the nation. But in effecting their objects mercantilist statesmen did, as a matter of fact, find it necessary to invent a very elaborate system of DISCRIMINATING DUTIES (*q.v.*), and so long as the principles of the mercantile system were accepted, any considerable approach to freedom of trade was impossible. Adam SMITH makes the theory of the BALANCE OF TRADE (*q.v.*), as elaborated in MUN'S *England's Treasure by Foreign Trade* (1664), the central doctrine of the mercantile system. He represents that most of the restraints and prohibitions of that system were the result of its teaching, or of ideas to which Mun gave expression. But in the light of modern historical research it can scarcely be maintained that the mercantile system was merely the outcome of a failure to distinguish between wealth and money. Mun's work, all of which was written before 1628, though not published until 1664, taken together with the pamphlets of Edward MISSELDEN and other writers, no doubt gave to the mercantile system something in the nature of a theoretical economic basis, but the system was "established" long before the controversy on the balance of trade and the bullion policy of the EAST INDIA COMPANY. The NAVIGATION LAWS, the CORN LAWS, the acts for the encouragement of tillage, the statute of apprenticeship, the Elizabethan poor law, and other great measures which constitute the mercantile system (see APPRENTICESHIP, STATUTE OF; LEGISLATION, ELIZABETHAN), cannot be traced to the influence of any group of economic writers. They were the result of the efforts of statesmen so to direct the economic forces of their time as to create a strong and independent State. In Adam Smith's time the conditions which had really inspired the old regulations had practically disappeared. He made the mercantile system seem ridiculous by showing that it was based upon a mere popular fallacy. Apparently unconscious of the gulf between the 16th or the 17th century and his own time, he attacked the mercantilists because they had not fulfilled objects they had never had in view. His chapters are admirably designed for the demolition of an already undermined and tottering system of political economy, but they do not convey a true impression of the real character and aims of his opponents. His defence of the Navigation Act of the Long Parliament, and his distinction between productive and unproductive labour and consumption, transferred to the sphere of practical statesmanship, would afford a complete justification of the mercantile system.

It is impossible, within the narrow limits of an article, to give even a sketch of the rise, progress, and decay of the mercantile system, or to estimate its results. Only a brief indication of the general lines of development can be attempted. The influence of the system at any time depends upon a variety of circumstances, —the wealth of the country, the state of industry and commerce, the nature and the

extent of foreign trade, the degree of political consolidation, the strength of the sentiment of nationalism, the power of the central authority and its relation to local or municipal bodies. Some of the earlier phases of the movement can be usefully studied in the commercial and industrial policy of James I. of Aragon. In the case of Barcelona, as in that of England, mercantilism succeeded a policy of free trade. In England the efforts of Edward I. to bring the industry and commerce of the country under the control of the government, and Edward III.'s free trade policy, were followed by a mercantilist regime. During the 15th century the development of the system can be traced in the struggles and rivalries of the staplers, a mixed body of English merchants and foreigners, the Hanse merchants, and the merchant adventurers, and the trade regulations of Edward IV. (see ADVENTURERS, MERCHANTS; HANSE OF LONDON; STAPLE; etc.). By the end of the century the general features of the mercantile system are well defined.

The general character of the economic problems which English statesmen had to grapple with in the 16th century has been indicated in a former article (see ENGLISH EARLY ECONOMIC HISTORY). The result was the mercantile system as embodied in the legislation of Elizabeth (see LEGISLATION, ELIZABETHAN); the organisation of the trading companies (see TRADE, FOREIGN, REGULATION OF); and the NAVIGATION LAWS (*q.v.*). An instructive parallel may be drawn between the economic policy of England at this period and that of France, Sweden, and other European countries. Henri IV. "dressed a new plan of the French monarchy; and though his great designs were intercepted by an immature death, and also by a succeeding minority, yet the great Cardinal Richelieu resumed it again. He first taught France that the *fleur de luces* could flourish at sea as well as on land, and adorned the sterns of his new-built ships with this prophetic inscription, '*Florent quoque lilia ponto*'" (Sir Philip Medows). But it was not only in this direction, but in his general policy, that he acted in accordance with the principles of the mercantile system; while Cardinal Richelieu was still more active in the same direction. The history of the system during the 17th century is practically the history of the internal measures, and the trade and diplomatic relations of England, France, Holland, and Sweden. Cromwell in England, and Colbert in France, are generally regarded as typical mercantilist statesmen. But this is scarcely true of Cromwell, Strafford approaching much nearer the ideal. In the time of the Commonwealth and protectorate, unmistakable signs can be discovered of the break-up of mercantilism, and the approach of a period of *laissez-faire*, particularly in relation to the trading companies, the poor law, and certain industrial statutes; and by the end of the 17th century the decay of pure mercantilism was very marked. It is curious to notice how closely in this respect France and England kept pace with each other. The causes of the decay of the mercantile system have already been briefly indicated (see ENGLISH EARLY ECONOMIC HISTORY; FREE TRADE, EARLY HISTORY OF). It is necessary to observe, however, that economic policy was in certain directions in advance of economic theory. That nations should pass through a mercantilist "stage" seems inevitable. In the economic policy of the Great Elector, Frederick William (reigned 1640-1688), and Frederick the Great (reigned 1740-1786), features similar to those of England at an earlier date can be discerned. Though the theory of the balance of trade has disappeared, the policy of regulating industry and commerce with a view to national interests as distinct from those of the consumer is still prevalent throughout Europe and in the colonies. It cannot be said, therefore, that the mercantile system, in some of its essential characteristics, has by any means disappeared.

[Schmoller, *Mercantile System*, trans. by W. J. Ashley. Macmillan.] W. A. S. H.

MERCANTILISM. See MERCANTILE SYSTEM.

MERCERS. The early history of this craft is obscure. They seem to have been originally traders in small wares, and "mercer" and "merchant" were frequently used interchangeably. But the term soon came to be restricted to dealers in what is now called haberdashery; and during the 15th century silks and velvets became their main articles of trade.

In London the mercers rose to importance during the reign of Edward III. Like some other misteries, their first formal association was probably in the form of a religious fraternity; and such a "fraternity of mercers" is mentioned as early as 1321. In 1365 they contributed more than all, save three other London misteries, to the expenses of carrying on the war in France; in 1377, like eight other misteries, they elected six members of the common council. It was not, however, until 1393 that the men of the mistery of mercery of the city of London secured by the payment of a heavy fine letters patent from Richard II., licensing them "to have a perpetual community" with power to elect four wardens to regulate the craft. The reason assigned for the license shows not only that the community was still largely of a religious character, but also that the mercers of that date were no longer content to deal in goods imported by others, but were themselves beginning to engage in foreign trade. It sets forth that "several men of the mistery often by misfortunes of the sea and other unfortunate casualties had been impoverished . . . where-

fore the men of the mistery desired to ordain some certitude for the sustentation of such poor, as well as of a chaplain to celebrate divine offices." Among the most successful of the great merchants of the mercers' company was Sir Richard WHITTINGTON (lord mayor in 1398, 1407, and 1420), who appointed it by his will (1421) trustee of his college, almshouse, and other charities. The company had already, in 1393, received permission to hold lands to a certain value in mortmain; by letters patent in 1424 it was expressly given the right to have a common seal, and to sue and be sued as a corporate person. It was from among the mercers that the organisation of Merchant Adventurers (see ADVENTURERS, MERCHANTS), arose early in the 15th century; and the two bodies long remained closely connected. So rapidly did the wealth of the mercers and their corporate dignity increase that during the second half of the 15th century the mercers' company was frequently placed first among the London misteries on ceremonial occasions, and this precedence was definitely confirmed to it by an order of the court of aldermen in 4 Henry VIII. In 1511 and subsequent years, Dean Colet, the son of a mercer, made the company trustee for his newly-founded school at St. Paul's, and granted to it considerable estates for the purpose. It built for itself a hall and chapel during 1517-52. During the later Tudor reigns the company grew in wealth and importance; it shared in the reputation of its member Sir Thomas GRESHAM; and it contributed largely towards the provision of troops, the storing of the city granaries, and other public purposes. Its position in the economic history of the 17th century is rendered sufficiently evident by the facts that it was in Mercers' Hall that the Council of Trade held its meetings in 1660, that there the earliest operations of the Bank of England took place in 1694, and that there subscriptions were received for the United East India Company in 1698. By this time, however, the company had come to be dissociated from the occupation whose name it bore. The loss of its buildings in the great fire of 1666 seriously embarrassed its finances: to pay off its debts it engaged, in 1698, in a most unprofitable scheme of granting annuities, from the disastrous effects of which it was only enabled to recover by means of a lottery authorised by 4 George III. During the present century its income has been enormously increased by the falling-in of building-leases in London. The annual revenue in 1879-80 was £82,758 (corporate, £47,341; trust, £35,417); and the livery in 1892 numbered 185.

There arose mercers' companies during the 15th, 16th, and 17th centuries in most other important English towns. The statute of apprentices (5 Eliz. c. 4) placed the craft of the mercer next after that of the "merchant trafficking into any parts beyond the sea" in the list of those occupations for apprenticeship to which a larger than the ordinary property qualification was necessary on the part of the parents. In the curious unions of incongruous crafts which were effected in the 16th and still more in the 17th century, it was frequently the mercers who gave their name to the chief craft organisation in the town. The main purpose of these later organisations was to enforce the law of apprenticeship, and to exclude strangers from the industry and trade of the several towns.

Soc.*, N. S., vii. (1893).] W. J. A.

MERCHANDIZE, MARKS ON. See TRADE MARKS.

MERCHANTABLENESS, IMPLIED WARRANTY OF. According to the civil law which is followed in many continental countries the seller of a thing is held to guarantee the buyer against any latent defect in it. But the general rule of English law is *caveat emptor*. The buyer is entitled to have the article he contracted for, but its quality and condition must be the subject of express stipulation. In modern times the tendency is to narrow the rule of *caveat emptor*, and a notable exception engrafted in it is the implied warranty of merchantableness. When goods are bought by description from a manufacturer or dealer, and the buyer has no opportunity of inspecting them before purchase, the law implies a warranty or condition that they shall be merchantable, that is to say, that they shall be reasonably fit for the purposes for which such goods are ordinarily used.

Merchants, History of English, p. 729; Merchants, Alien, p. 731.

MERCHANTS, HISTORY OF ENGLISH. Before the conquest, as long after, the merchant united several functions which subsequently became differentiated. He was the owner, whether individually or as a partner with others (CANON LAW; PARTNERSHIP, CANONIST THEORY OF), both of the goods transported and of the vessel in which they were carried. "I enter *my* ship with

my merchandise and sell *my* things," says the merchant in Archbishop Ælfric's *Colloquium*. On the other side, the merchant vendor of ready-made articles was at first indistinguishable from the artisan, who was eligible to the gild merchant (see GILDS). The merchant shipowner was necessarily a man of considerable wealth, and by a law of Ina of the 8th century, every merchant who had made three voyages was "thaneworthy," even though by birth a serf. The enumeration, in the dialogue above referred to, of the articles imported, points to a southern trade for the most part. "What do you bring to us?" the English merchant is asked. He replies: "Skins, silks, costly gems, and gold, various garments, pigments, wine, oil, ivory and orichalcus, copper and tin, silver, glass, and such like." The metallic imports, excepting gold, were probably the fruit of a coasting trade with Cornwall; the skins from Scandinavia.

The Norman conquest and the military ideas which then became dominant repressed mercantile activity. Internally trade was hampered by local privileges and tolls; at the ports by excessive duties. But in the middle of the 13th century the creation of the STAPLE showed the importance which the kings were beginning to attach to the export of wool to the low countries, where it was manufactured into cloth, large quantities of which were imported into England. About the same time began the endless disputes between the kings and the corporation of London as to the rights of alien merchants, showing the influence which the English mercantile class was beginning to assert. To the same period belongs the statute of merchants (see LAW MERCHANT). The great development of this class dates, however, from a century later, and was due to a concurrence of various causes. The first was the successful rivalry of the staplers with the Italian exporters of wool, who were privileged to ship wool without paying staple dues, and who in return supplied the kings, especially Edward III., with money for the necessities of state. The second was the expulsion of the Jews (see JEWS, ECONOMIC POSITION AND INFLUENCE OF) in 1290, which had set free their hoarded wealth. Thirdly, the dissolution of the order of the Temple in 1308 (see TEMPLARS) set free large accumulations of capital during the twenty-six years which elapsed before the bulk of the Templars' property, though by no means all of it, was transferred from the crown to the Knights Hospitallers. Fourthly, the northern coal-trade and the manufacture and export of cloth, specially stimulated by the invitation of Flemish artisans to this country by Edward III., created the first wealthy class of manufacturers and the first wealthy class of exporters of finished goods. This class, represented in both branches by the Canynges of Bristol, sprang up with extraordinary rapidity, aided by the favouring circumstances already enumerated. Its rise suggested to Edward III. a means of disembarrassing himself of his Italian creditors, whose resources he had seriously drained, and whom he felt himself wholly unable to repay. In 1338 he made a proposal to the English merchants of the pre-emption of the 30,000 sacks of wool granted him as a subsidy. After pressure put upon them by the king and council, and by the Commons, a group of English speculators appears to have contracted for the wool upon conditions which, it may be inferred, were prejudicial to the Italians, who were in the same year generally arrested throughout the kingdom. In 1342 the merchants met in London, as a sort of sub-estate of the realm, and granted Edward III. a subsidy of 40s. a sack without consent of parliament. In requital they were gratified, in 1343, by the statutory raising of the price of wool, a policy possible to a country which enjoyed a monopoly. Two years later the king's creditors—the Bardi and Peruzzi—failed, and the English speculators assumed the title of "The King's Merchants," together with the financial functions which had for a time enriched their Italian rivals. They farmed the CUSTOM, large latitude being allowed to their impositions. They favoured the export of their own wools, and placed impediments in the way of those of their competitors. They farmed the SUBSIDIES (*q.v.*), buying the wools cheap and selling them, as the Commons complained in 1348, at a profit of 60 per cent. They acquired vast wealth as royal exchangers (see EXCHANGER, ROYAL) and as masters of the MINT, in which last capacity they were accused, in 1351, of malpractices with the coinage. They contracted for PURVEYANCE—buying provisions at nominal prices in the king's name, and reselling them at large profits,—for provisioning garrisons, and for raising troops, whose number and quality did not always tally with the muster roll. To this period belongs the rise of the great London trading companies, such as the pepperers or grocers, and drapers, and of the great capitalists, of whom the De la Poles and Whittington are the most notable. It is to be observed that Richard de la Pole, who belongs to a generation earlier, built up his fortune at the beginning of the reign of Edward III. by such contracts with the crown, while Whittington lent money on the security of subsidies. In 1406 to the merchants was entrusted the keeping of the sea, and one of their number, Nicholas Blackburn, was made admiral of the fleet.

After the Wars of the Roses the financial organisation of the kingdom was more complete, and transactions between the crown and its subjects were conducted through the agency of the two great mercantile societies of the staple and the merchant adventurers (see

ADVENTURERS, MERCHANTS; STAPLE), with one or both of which bodies eminent merchants, such as the Greshams, were as a rule associated. The internal tranquillity which followed upon the accession of Henry VII. was naturally advantageous to this class, and when public opinion became stirred, in the close of the 15th century, against the practice of inclosure, the "merchants, clothiers, and others," were attacked as engrossers of land and evictors. Even Thomas Cromwell, himself sprung from their ranks, contemplated an act in 1535, "That no merchant shall purchase more than £40 lands by the year." A bill to this effect, limiting the sum to £50, was actually introduced into parliament in 1559. These are evidences of the opulence of the class who, emulating the example of the De la Poles, extended their influence by aristocratic or, in the case of the Boleyns, even royal alliances.

During the decay of the staple under Henry VIII., and after its ruin on the capture of Calais under Mary, English mercantile enterprise availed itself of the new discoveries. The Thornes of Bristol made their way to the New World; Hawkins of Plymouth to Guinea and Brazil; Hore of London founded a colony in Newfoundland. These expeditions led to the formation of such trading companies as the RUSSIA; the TURKEY; the Guinea (see GUINEA TRADE); and the EAST INDIA and the VIRGINIA companies (see notices of these COMPANIES). It was through connection with these companies that the best known among the merchant princes of the 17th century gained their fortunes, such as Sir Thomas Smythe, Dudley NORTH, Sir Josiah CHILD, and Edward Colston of Bristol. The closing of the exchequer by Charles II. (EXCHEQUER, CLOSING OF THE) was an influential factor in determining the sympathies of the mercantile class towards the revolution, and it was to them that the foundation and success of the bank of England, a mainstay of William III.'s government, was due. The general diffusion of wealth during the last century, due to the development of manufacturing industry, caused the disappearance of the line of demarcation which down to that time had distinguished the merchants from other classes.

To sum up. The great age of English merchants was the 14th century, when they were enriched partly through extension of trade, but more especially through financial business with the crown. The second period of prosperity, associated with the staple and the merchant adventurers, lasted from the conclusion of the Wars of the Roses till towards the close of the reign of Henry VIII. The third began with the exploitation of the new discoveries by the great trading companies, and lasted till the Civil War. The fourth was due to the extension of trade with America and India during the close of the reign of Charles II. After this time great fortunes were amassed by the development of internal trade, the term merchant reverting to its ancient signification, and no longer necessarily bearing a connotation of foreign adventure.

MERCHANTS, ALIEN. Under the Anglo-Saxon kings and for two centuries after the conquest, the attitude of the English people and government towards aliens trading in this country was, as might be expected from the backward condition of our civilisation, one of suspicion and hostility. Safe conduct was at first granted to individuals, then to nationalities, as to the subjects of the emperor by Ethelred II. The reign of John was marked by an unprecedented liberality of treatment. Upon his accession John issued circular letters to his officials at the ports forbidding the oppression of alien merchants in the matter of tolls, and ordering that they should enjoy the same security as English merchants in their respective countries. Similar provisions were embodied in §§ 41, 42 of Magna Carta. These gave rise to long contention as to the meaning of the phrase *sine omnibus malis toltis* (see MALATOLTA), from which foreign traders were to be exempt, and which was eventually decided to include all duties not voted by parliament. With regard to the stipulation for freedom of trade, the interests of the chartered towns were opposed to those of the crown and aristocracy. London from the first led the opposition to aliens, and on this account supported the barons against Henry III., during whose reign extensive immigrations took place. The alien merchants, on the other hand, learnt to associate themselves in nationalities or cities and to conclude private treaties, promising reciprocity for such trading privileges as the citizens were disposed to concede to them. Such an arrangement was entered into with London by the merchants of Amiens, Corby, and Nesle in 1237. In 1267 the HANSE (see arts. on subject) established a factory in London, and soon afterwards the English a similar one in Danzig. But the normal policy of London was one of petty persecution of aliens. With the accession of Edward I. the system of reciprocity between towns was replaced by the control of the central government. Edward seized the city's charters and extended the trading privileges of the aliens. Upon the restoration of the privileges of London in 1298 a renewal of former repressive ordinances against foreigners took place. In 1303 Edward issued the Carta Mercatoria

in favour of foreign merchants. This is one of the most notable documents of English history. It had a national scope. It guaranteed personal safety to all foreign merchants. It allowed them to import all kinds of wares; to sell wholesale both to freemen of towns and to strangers, and to sell retail to all both spices and mercery. Authorities in towns and markets were to be attentive to their complaints and to administer justice according to the LAW MERCHANT. Alien merchants were entitled to demand mixed juries in trials between aliens and Englishmen, and a judge was specially appointed to take cognisance of cases in which they were concerned. They in return were to pay additional customs. All that was left of the exclusive privileges hitherto so jealously insisted upon by the towns was the retail trade. In 1311, under the feeble government of Edward II., the Londoners, with the assistance of the barons, procured a repeal of the articles of this charter as to residence and retail trading, and restricted the stay of foreign merchants to forty days. Although in 1322 Edward II. felt strong enough to restore the charter, a reaction in favour of the city set in with the accession of Edward III. The restrictions upon aliens' freedom of trade were renewed. The necessary consequence was a rise of prices, which led to the re-establishment of the aliens in their privileges. This was followed by a series of acts protecting aliens against unjust arrest for the debts of others, allowing them to make sales on board their ships, affording them an interval after the outbreak of war for the removal of their goods, accepting their own declarations as the basis of payment of customs, and exempting them from the exactions of royal purveyors. But the opposition of the city was persistent, and the tide again turned at the end of Edward III.'s reign. While Richard II.'s policy was wavering, Henry IV. cultivated the good-will of the city by large concessions, so that in 1406 the clothworkers and merchants of the country complained of exclusion from direct dealings with the foreigner. A relaxation was then made, allowing wholesale dealing between English and foreign merchants everywhere. Subject to this provision, the ascendency of the city was definitely established. The high water mark of protection against alien merchants was an act of 1439 (18 Hen. VI. c. 4). By this act trade among foreign merchants was prohibited; hosts were to be appointed with whom they should lodge, and who should supervise their contracts; a stay limited to eight months was allowed for the transaction of business, and goods were to be taken out in exchange for those imported, the object of which was to check an alleged depletion of gold. The effect of this rigorous act was to drive the foreign merchants from places where it was enforced into the country, where they embarked in the trade of export of wool. By an act of 1465, directed against the Italians, who were foremost in this business, executory contracts for the purchase of wool were forbidden (4 Ed. IV. c. 4). But foreign merchants profited from the struggle between the rival houses of York and Lancaster. The Italians generally supported the Lancastrians, and received concessions in the way of customs dues from Henry IV. Edward IV. leaned on the Hanse (see HANSE TOWNS), and in return for their aid in his restoration in 1471 concluded with them the Treaty of Utrecht (1475), conceding to them extensive privileges in England. With the object of gaining the favour of the commercial classes, Richard III. pursued the anti-Italian policy of his brother. The act of 1485 "touchinge the Marchauntes of Italy" (1 Ric. III. c. 9) restored many of the restrictions of the act of 1439 which had expired, but its effects were probably more felt in the country than in the towns, which protected themselves in their privileges by the sedulous enforcement of their customs. This perhaps accounts for the fact that Henry VII. ventured, immediately after his accession, to repeal the portions of Richard's act which affected Italian merchants (1 Hen. VII. c. 10), which he would scarcely have done had London been vitally interested in their maintenance. Possibly the Italians, who, as we know from the *Libelle of Englyshe Polycye*, were notorious for their skill in bribing the official classes, took advantage of Henry's financial difficulties and rendered a pecuniary equivalent for the restoration of their privileges. The country gentry also would favour concessions facilitating the operations of profitable customers. But three years later Henry revived the act of 1465 against executory purchases of wool (4 Hen. VII. c. 11). This act expired in 1499, and an interval of comparatively free trade followed accompanied by numerous immigrations and consequent dissatisfaction in London and other large towns. In 1514 the trading companies of the whole kingdom joined in a remonstrance to the king, and petitioned for a revival with increased stringency of the act of 1439. This petition proving ineffective, it was followed three years later by the riot long after known as "evil May day," directed, however, principally against foreign handicraftsmen. In 1523 the exclusive trading privileges of the city of London were invaded by an act permitting country clothiers to deal directly with foreign merchants (14 & 15 Hen. VIII. c. 1). Discontent was also expressed, as it had been by the parliaments of Edward IV. and Henry VII., at the exemptions from aliens' customs duties obtained by means of letters of naturalisation. In 1530 parliament laid down the principle that naturalised aliens should continue in future to pay aliens' dues (22 Hen. VIII. c.

8), which involved a large protective difference in favour of the English merchant. But a notable reversal of policy was effected by Cromwell in 1539, when by an exercise of high prerogative alien merchants were for a fixed period of seven years placed, as far as customs duties were concerned, upon the same level as Englishmen. Pursuing the same policy, while bidding for popular support by discouraging alien handicraftsmen, Cromwell, as Henry a century earlier, favoured alien merchants by suspending in their favour the execution of the act "concerning strangers" of 1540 (32 Hen. VIII. c. 16). This act revived that of 1483 (1 Ric. III. c. 9), which limited to eight months the time allowed to foreign merchants within which to dispose of their wares. But it was only enforced for the purpose of recruiting the treasury with the fees paid upon naturalisation. Upon the expiration of the proclaimed period in 1547, a return was made to the policy of differential duties on exports which were finally abolished by an act of 1672 (25 Car. II. c. 6). A collection of documents has been printed by Schanz, ranging from 1485 to the reign of Elizabeth, which set out the grievances of alien merchants. These may be classed under three heads—complaints against English commercial law, such as the navigation acts; against the customs, and against officials, whether of the crown or of the towns, especially of London. Among the first class of grievances were the prohibition to buy what were known as STAPLE wares except through the middleman, the stapler, and those forbidding the export of manufactures in an unfinished state, or of raw material, except at the cost of an expensive licence. It was also disadvantageous to the foreign importer to be compelled to take English goods in exchange, burdened with the enormous profits of the staplers, rather than to ship tin and hides from the warehouses of the Hanse. To enforce this regulation a vexatious system of demanding surety had been devised (5 Hen. IV. c. 9; 4 Ed. IV. c. 6). Against "Customers"[1] there were many complaints. An act of 1487 (3 Hen. VII. c. 7) provided that merchandise should be entered in the customers' books in the name of the true owner. This, until repealed by 1 Hen. VIII. c. 5, furnished numerous pretexts for confiscation. In 1530 an attempt was made to revive a statute of 1381, forbidding foreign merchants to transact business by letters of exchange without a royal licence. This was done to check the decline in English exports. The measure, opposed by GRESHAM, was only maintained *in terrorem*, a common policy of this period. Liberty of exchange was granted by proclamation in 1538.

Numerous complaints arose out of the multitudinous petty exactions levied under the pretext of local customs and tolls upon foreign merchants. Some four-and-twenty of these are enumerated. In the roadstead, at the port of unlading, in the market-places of the towns, upon lading the return cargo, upon clearing, upon entering at the customs, whether outwards or inwards, excuses were found for these demands. As English merchants, especially citizens of London and other chartered towns, were exempt from many of them, besides enjoying the advantage of differential customs, they were not unpopular in England, so far as they increased the protection enjoyed by native subjects. It was affirmed on the one side and denied on the other that these exactions had been multiplied during the first half of the 16th century. It is significant that the grievance of "going to host" had disappeared, that invention having been found to result in surreptitious partnerships between the foreign merchants and their hosts, in which they had secured the advantages intended to be reserved to Englishmen (cp. the "act for the trewe payment of the kinges customes," 1 Hen. VIII. c. 5). Resident alien merchants were made to contribute to the subsidies, a line of distinction being generally drawn by the subsidy acts between aliens in possession of property up to a certain value and those in receipt of wages.

The history of the relations of the English government to alien merchants during the 16th century shows the growing enterprise of English merchants and their dissatisfaction at the privileges enjoyed by favoured corporations, like the Hanse, or by individuals wealthy enough to purchase royal letters of licence (see LICENSES). With this national feeling the Tudor governments gradually associated themselves. With the disestablishment of the Hanse, begun under Edward VI. and practically completed under Elizabeth, the exceptional position of alien merchants in this country came to an end.

MERCHANTS' PETITION OF 1820, THE. A very able document, drawn up by T. TOOKE (*q.v.*), subscribed by all the most eminent merchants in London, and presented to the House of Commons in 1820 by Mr. Alexander Baring. The contents of its fifteen paragraphs may be thus summarised.

The end of foreign commerce is to import what can be best produced abroad, and to export, in payment, what can be best produced at home. This end can only be attained where there is freedom from restraint. The maxim, "to buy in the cheapest and to sell in the dearest market," applies to international

[1] Officers of customs, H. Hall, *Customs Rev. of England.*

transactions. Unhappily, a very different policy has prevailed, and "jealousy and hostility" have taken the place of "mutual benefit" and "harmony." The fallacy of the protectionists consists in supposing that imports from abroad tend to discourage home products, whereas they actively stimulate such industries as are in fact suitable to the importing country. This follows from the rule that exports must, in the long run, pay for imports. Protection seldom benefits the protected, and never to the extent of the loss occasioned to others. When once the road of protection is travelled, there is no halting, until all foreign commerce whatsoever is destroyed; indeed England might, with as good reason, demand protection against Scotland, or Scotland against England, and the different counties of each country against each other.

An inquiry would probably show a connection between a protective policy and the distress prevalent. A declaration in favour of free trade would carry weight abroad, where protectionists can point to the authority and example of England, and would tend to counteract the commercial hostility of foreign nations. Although a policy of RECIPROCITY (*q.v.*) may be defended, in particular cases, on diplomatic grounds, "it does not follow that we shall maintain our restrictions in cases where the desired concessions cannot be obtained. Our restrictions would not be the less prejudicial . . . because other governments persisted in preserving impolitic regulations." In any case "the recognition of a sound principle or standard" may be expected to have a salutary influence on other states. The petition does not complain of duties collected for purely revenue purposes. "It is against every restrictive regulation of trade, not essential to the revenue, against all duties merely protective from foreign competition, and the excess of such duties as are partly for the purpose of revenue, and partly for that of protection" that its prayer is addressed.

The language, as to reciprocity, quoted above, is noteworthy, as it is often said that the case for free trade rested on the expectation that other nations would follow England's example. It is related that the second Lord LIVERPOOL (*q.v.*), after reading the petition, expressed his hearty agreement with every word of it. Some time had to pass before free trade was seriously considered. The petition, however, was "the originating impulse to the movement, which, by progressive steps, had led to the final establishment of the principles therein enunciated."

[Tooke's *History of Prices*, vol. v. p. 396; and vol. vi., London, 1838-57, 8vo: app. 1, pp. 331-344, where the petition itself is printed in full, with Mr. Tooke's account of the circumstances in which it originated.—Smith's *Wealth of Nations*, edited by M'Culloch, 4th edition, note xv., Edinburgh, 1850, 8vo.—Nassau Senior's *Three Lectures on the transmission of the Precious Metals, and the mercantile theory of Wealth* (delivered at Oxford in 1827), London, 1830, 8vo.] H. E. E.

MERCHET was the payment due from a villein tenant on a manor to his lord for leave to give his daughter or his sister in marriage. With the exception of an uncertain tenure, it was probably the most constant mark of serfdom, yet cannot be considered as an absolute test, as it was neither universal among holders who were certainly villeins, nor entirely absent from SOCMEN on ancient demesne. Occasionally, it seems, the payment was only due if the marriage would remove the woman from the manor or the hundred to which she belonged.

[Bracton's *Note-Book*, ed. Maitland, 1887, cases 395, 753.—Ducange, *Glossarium*.—Vinogradoff, *Villainage in England*.] E. G. P.

MERCIER (*alias* LEMERCIER) DE LA RIVIÈRE, PAUL PIERRE (1720-1794), was a member of the parliament from 1747 to 1759, where his attractive but determined character, his high integrity and loyalty, made him respected. In 1757 he was appointed steward of the island of Martinique, and discharged his duties there with great disinterestedness and fertility of resource. He even devoted his personal credit, and when necessary his own money, to the public service. He reaped nothing but ingratitude from this at first. The Duc de Choiseuil, then minister for the navy and foreign affairs, took umbrage at his applying the principles of free trade to the colonies which he governed in complete opposition to the colonial system in force at that time. He was recalled; but he had anticipated this and returned to France by order of his doctor, July 1764.

On his retirement to private life he wrote and published, in 1767, *L'Ordre Naturel et Essentiel des Sociétés Politiques* (1 vol. 4to, or 2 vols. 12mo), a work which made such a sensation in his time that some of his contemporaries placed it, not only on a level with, but even above *L'Esprit des lois*. This book, apart from its physiocratic errors and inordinate overpraise of absolute power (the author suggests the despotism of China as an ideal model), contains some fine passages which were obscured by the tone of exaggeration in it. It explains the ideas of the PHYSIOCRATS. Their economic opinions, which are very simple, may be summed up thus: there is only one industry which gives a net product capable of increasing social wealth —this is agriculture. Other industries can only produce an equivalent to the amount employed in them. In one word, agriculture alone is really productive. Hence, taxation is in the end always borne by agriculture, and to avoid useless and costly repercussion of taxation it would be better to have a single tax—the IMPÔT UNIQUE. Adam Smith, who was in a position to judge this book impartially, says (*W. of N.*, bk. iv. ch. ix.) that it contains "the most distinct and best connected account of this doctrine," that of the

ÉCONOMISTES (*q.v.*). The Empress Catherine II. invited Mercier de la Rivière to St. Petersburg. According to her account of the matter, by his pretentiousness and want of tact, he made himself ridiculous there. He returned, according to the Czarina, dismissed, but largely rewarded by her. This had little in common with the disinterestedness he had shown at Martinique. Mercier, according to his own statement, refused the position and pension he was offered, only taking what had been agreed on when he left France. This seems nearer the truth. Catherine sneered at him; "He believed," she wrote to Voltaire, "that we walked on all fours and he came charitably to set us on our hind legs."

Mercier de la Rivière wrote many works, but only those on political economy are quoted here. *L'intérêt général de l'état ou la liberté du commerce des blés*, 1770, 12mo.—*De l'instruction publique*, 1771, 4to.—*Procès pendant au tribunal du public; lettre sur les économistes* (undated, probably 1787). Du Pont (de Nemours) has cleverly summed up *L'ordre naturel* in *De l'origine et des progrès d'une science nouvelle.* This, as well as the work of which it is an abridged version, is printed in Guillaumin's collection (*Physiocrates*, 1846).

[For the less-known events of the life of this author see the notice read in 1858 at the Académie des Sciences morales et politiques, by M. Felix Joubleau. See also account in L. de Lavergne, *Les économistes français du XVIII^e siècle.*]

A. C. f.

MERCIER, LOUIS SÉBASTIEN (1740-1814), a Parisian barrister, journalist, and member of the convention during the revolutionary period, —was a most copious and voluminous writer; and it is impossible to give here a complete list of his writings.

His best-known work is the *Tableau de Paris* (12 vols., Amsterdam, 1783-1788), which, notwithstanding its desultory and declamatory form, is valuable evidence of the moral and physical aspect of Paris on the eve of the revolution; it is full of life and keen observations. In 1792 he published a pamphlet, *Réflexions d'un Patriote sur les Assignats, les craintes d'une banqueroute Nationale, etc.*, intended to demonstrate that the fears concerning an impending national bankruptcy were unfounded. One of the first in date of his works is *L'An 2440, rêve s'il en fût jamais* (1771, reprinted 1800); it is the dream of a disciple of Voltaire and Rousseau, but free from any tendency towards a communistic reform of society. E. Ca.

MEREDITH, Sir WILLIAM (1724-1790), Whig politician, succeeded to the baronetcy in 1752. In 1765 he was appointed a civil lord of the admiralty. Horace Walpole describes him as inflexibly serious but of no great head, a judgment which his *Historical Remarks on the Taxation of Free States*, London, 1778, 4to, belie. In this work, in the form of letters to a friend, Meredith points the moral of the folly of attempting to tax the American colonists, by the examples of Carthage, Rome, Sparta, and Athens.

[*Dictionary of National Biography*, vol. xxxvii. p. 271.] H. E. E.

MERELLO, MICHELE (17th century). An economist who wrote on the deposit banks established in Italy in the 16th century. He describes the establishment of the historic bank of St. George, Genoa (see BANKING), founded to consolidate and provide for the redemption of the debts of that republic by uniting the creditors in a single institution and allowing them the proceeds of certain taxes for a certain number of years. The unification of these creditors was called *compera*. Merello, who objected to taxes, praises this system because the cession made by the state was for a certain number of years only and did not entail a perpetual burden on the citizen.

Della guerra fatta dai francesi . . . con una breve dichiarazione dell' istituzione della compera di San Giorgio, Genoa, 1607.

[Gobbi, *L'economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, 1889.—Ricca-Salerno, *Storia delle dottrine finanziarie in Italia*, Rome, 1880.] U. R.

MERENDA, ANTONIO (17th century), was professor of civil law at the university of Pavia, and author of a treatise on exchange. The important changes in economics had weakened the old doctrines, and admitted the lawfulness of profits made from productive employment of money. Merenda protested in the name of CANON LAW (*q.v.*) against the comparatively liberal opinions of many writers of his day; who, though they proclaimed the most absolute respect for the principle that loans should be gratuitous, in practice sacrificed the enforcement of this doctrine, leaving openings for evasion. Merenda opposes any reconciliation between ecclesiastical precepts and the requirements of common life. He does not deny that LUCRUM CESSANS (*q.v.*) supplies a lawful motive for demanding compensation, but he requires such absolute and complete proof, almost impossible ever to obtain, that the efficacy of this principle is effectually annulled. Merenda does not doubt the lawfulness of a true and real exchange, but he adds that it becomes unlawful as soon as the suspicion arises that payment is to be made in a different place from that fixed in the contract. Merenda, distinguishing loans from exchange, and contrasting gratuitous loans with onerous exchange, is opposed to those forms of exchange which conceal usury (see INTEREST AND USURY), and criticised those authors who, by defending the means adopted by traders, regarded them as lawful. He also opposed fairs where usurious exchanges were effected.

De cambio nundinali Tractatus, Pavia, 1645.

[Cossa, *An Introduction to the study of Political Economy*, trans., London, 1893.—Gobbi, *L'economia politica negli scrittori italiani dei secoli XVI.-XVII.*, Milan, 1889.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli* Modena, 1893.] U. R.

MERGER. The term merger signifies the ending of a legal right by its absorption into a higher right of the same kind. Thus when a lessee purchases the property let to him, his rights as a tenant merge in his more extensive rights as a proprietor. When a man entitled to a servitude or an easement over his neighbour's land (*e.g.* a right of way) buys that land, his servitude or easement is similarly merged. Again, a simple contract is merged in a subsequent contract under seal, if made between the same parties and dealing with the same subject-matter. For a contract under seal confers more extensive rights than a simple contract does. Thus, a simple contract must be sued upon within six years of making. A contract under seal can be sued upon at any time within twenty years of making. F. C. M.

MERIVALE, HERMAN (1806-1874), was trained at Oxford, where he took a first in classics, and was elected fellow of Balliol, 1832. Recognised by his contemporaries as "one of the two best educated men in his university generation" (Dr. Vaughan, Funeral Sermon at the Temple Church, Feb. 1874), he maintained this position during life, for, according to an obituary notice in the *Economist*, he was "one of the most acute and best read political economists of his time." In 1837 he was elected to the newly-instituted chair of political economy at Oxford. In his preliminary lecture the professor distinguished between political economy the science and political economy the art, defending the science from the attacks of those who have looked to it as to a sort of philosopher's stone which would turn everything it touched into gold. Its object, he maintained, was *not to create but to prove;* and he utterly repudiated the idea that political economy was based on a degrading estimate of human nature.

He then considered the principles on which colonisation should be conducted, as connected with emigration, employment of labour, the disposal of public lands, and the system of E. G. WAKEFIELD (*q.v.*). His eighth lecture exposes the fallacy of the colonial system then in vogue. He pointed out that "altho' under certain conditions . . . a country might gain by the possession of an artificially monopolised market for its manufactured commodities, yet in actual practice such gain is found to be wholly illusory."

The publication of these lectures led to his employment under government; he became under-secretary of state in two of the most important departments of government for the long period of twenty-six years—from 1847 until his death in 1874.

The late Lord Lytton wrote, in his copy of Merivale's *Historical Studies:* "The author is one of the most remarkable men I have ever met. The main characteristic of his intellect is massiveness—and it is the massiveness of gold . . . he belongs to the very highest order of mind in my time and country. I can compare him to no other of less calibre than Macaulay . . . Macaulay is the finer artist, and Merivale the more original thinker."

Five Lectures on the Principles of a Legislative Provision for the Poor in Ireland, 1838.—*Lectures on Colonisation and the Colonies*, 1st ed., 1841; 2nd ed., 1861. A. L.

MERTON, THE STATUTE (OR PROVISIONS) OF, 20 Hen. III. (1235-36), contains several chapters, but that of most economic importance is c. 4, which is what is commonly understood when the "Statute of Merton" is referred to. "Whereas," it runs, "many magnates of England, who have infeoffed their knights and free tenants of small tenements in their great manors, have complained that they cannot make their profit (*commodum*) of the residue of their manors, as well as of the wastes, woods, and pastures . . . it is provided that whenever such feoffees do bring an assize of novel disseisin for their common of pasture, and it is acknowledged before the justices that they have as much pasture as suffice to their tenements, and that they have free ingress and regress from their tenement into the pasture, then let them be content therewith." If it is proved that they have not sufficient pasture, they shall recover their seisin, and the disseisors shall be amerced and pay damages; if they have, then "let the others make their lawful profit of the residue."

[The statute is printed in *Statutes of the Realm* (1810), i. p. 1. The comments of Bracton, with a translation and some observations thereon, will be found in Digby, *Hist. of the Law of Real Property* (4th ed. 1892), pp. 190-208. It will be observed that the statute guaranteed only the rights of free tenants. Lord Chancellor Herschell has recently declared in the House of Lords that "the Statute of Merton has been practically obsolete for centuries, and it is only in comparatively recent times that it has been revived and again put in force," and that "the means of trying the right of the lord to enclose is a process which is not only obsolete, but which has ceased to exist." *Times* Report, 28th July 1893.]

W. J. A.

MESNIL MARIGNY, JULES DU (1810-1885). His *Économie Politique devenue science exacte* (Political Economy made an Exact Science, Paris, 4 ed. from 1859 to 1883) is principally written to confute J. B. Say's theory of exchanges, and to maintain that "the benefits which two nations reap from mutual exchanges of the same value may be very unequal." This leads to the assertion that "each nation must have its own political economy appropriated to its physical conditions and to its national character."

The avowed scope of his *Histoire de l'Économie Politique des Anciens Peuples de l'Inde, de l'Egypte, de la Judée et de la Grèce* (Paris, 3 vols., 1878, 3rd ed.) is to prove "in an irrefutable way, and by a

great number of instances, that the system of protecting national manufactures . . . was very often followed in antiquity." E. Ca.

MESSANCE, M. (18th century), an eminent statistician, revenue officer at S. Etienne-en-Forez in the reign of Louis XV. In 1759 he became under secretary to M. de la Michodière, intendant of Auvergne, and in this capacity he continued the statistical investigations instituted by his chief, with a view to disproving the theory of the author of *L'ami des hommes*, the Marquis de Mirabeau, as to the decline of population in France. In 1763 he presented the result in book form to the intendant, who insisted on its being printed in Messance's name [*Nouvelles Recherches*, p. 5].

In 1775 Messance sent a table of mortality, which he had prepared, to Voltaire, who in a humorous reply commented on its accuracy and utility. Messance's two works on population were issued at an interval of twenty-two years; in the second of these he refers to Necker's *Administration des Finances*, and Adam Smith's *Wealth of Nations*, both which publications had preceded it. His works are entitled:

Recherches sur la population des généralités d'Auvergne, de Lyon, de Rouen, et de quelques provinces et villes du royaume, avec réflections sur la valeur du blé, tant en France qu'en Angleterre, depuis 1674, jusqu'en 1764, Paris, Durand, 1766, 4to.—*Nouvelles recherches sur la population de la France avec des remarques importantes sur divers objets d'administration*, Lyon, 1788, 4to.

[*Dictionnaire de l'Économie politique*, p. 158.]

See also references in *Wealth of Nations*, bk. i. chs. viii. and xi., where A. Smith speaks in high terms of the investigations which Messance had made (cp. Levasseur, *La population française*). A. L.

MESSOR, an officer found on large estates, whose duty was to superintend the harvest on the manor, and in some cases to collect fines due to the lord from his tenantry. Under the manorial agricultural system there was an official, either elected or appointed, for almost every separate function.

[Vinogradoff, *Villainage in England*.] E. G. P.

MESSUAGE (Low Lat. *Mesuagium*), a dwelling, means properly a dwelling-house with the land belonging to it, but is often used for a garden, stable, or any kind of domestic building.

[Cowel, *Interpreter*, London, 1727.] A. E. S.

MESTA. "The *mesta*"—writes, towards the very end of the last century, M. de Bourgoing, a French diplomatist, who had a long experience of Spain,—"the *mesta* is a company of powerful sheep-owners, rich monasteries, Spanish grandees, wealthy individuals, who have succeeded in feeding their (migrating) flocks at the expense of the public during all the seasons of the year, and in obtaining unconsidered legal enactments to sanction a state of things which has been at first prompted by necessity" (*Tableau de l'Espagne*, vol. i. pp. 75-123, edit. 1807. The two first editions of 1789 and 1797 are anonymous). This necessity resulted from natural circumstances—the difference of climate between the cold mountains of northern and the warm plains of southern Spain, and from historical conditions—the existence, during the centuries of warfare between the Moors and the Christians, of an extensive debateable land, exposed to armed incursions and destitute of the security which is the primary requisite of agricultural cultivation. In 1200 king Alonso VIII. of Castile first granted the itinerant cattle herds the privilege of grazing on all waste and open lands, but subject to the obligation to compensate the owners for all damage to inclosed fields, vines, gardens, standing crops, etc. This privilege, gradually enlarged and confirmed under subsequent reigns, led to most abusive encroachments, especially under the growing influence of the *Honrado Concejo de la Mesta* or Honorable Association of the Cattle-owners. The exact date of its foundation is unknown, but it certainly goes back very far into the middle ages. About 1500, Ferdinand and Isabella, being in want of money, listened to the solicitations of the *Concejo de la Mesta* and gave it an official status by appointing a president and calling to that post a minister and member of the royal council. In 1511, the ordinances and laws concerning the *mesta* were by royal command collected by Palacios Rubios, a celebrated jurisconsult of the time, approved and promulgated. The privileges thus confirmed may be epitomised as follows:

1. The right of pasture on all open lands, which led to constant and successful interference of the *mesta* against all attempts of inclosing or even putting under tillage hitherto unbroken land. Their pretensions were formally recognised by a law of 1633, forbidding the plantation of new vines and the ploughing of previously uncleared land.

2. The obligation to keep open at all times *cañadas* or broad tracks for the free and unimpeded passage of the cattle, which were to be able to move "grazing." No inclosures were tolerated on either side of the *cañada*, and the flocks unmercifully invaded the neighbouring gardens and fields.

3. The exemption from several taxes and tolls, which indirectly led to new burdens imposed on the already overburdened tillers of the soil.

An official census of 1480 puts down at 2,694,032 the heads of cattle, which in 1477 had migrated through the passes of Castile; another account of 1563 gives the following numbers: 2,303,027 sheep and goats, 14,127 oxen, and 25,215 pigs. In 1724, Ustaritz (*q.v.*) computes the number of migrating sheep at 4,000,000 (which figure is confirmed by an official census of 1746), with a much higher estimate for settled and permanent flocks.

The devastations caused by the wandering flocks of the *mesta* have been the main cause of the ruin of Spanish agriculture. This frightful oppression lasted until the end of the last century, and only receded before the strenuous endeavours of the enlightened statesmen of the time, Florida-Blanca, Rodriguez de Campomanes, and most of all JOVELLANOS (*q.v.*).

[A substantial historical account of the *mesta*, and of the Spanish literature on the subject, is to be found in chs. xxxiv. and lxiv. of Colmeiro's *Historia de la Economía Política en España*. See also Bonwick's *Romance of the Wool Trade* (1887).—Haebler's *Wirtschaftliche Blüte Spaniens im 16 Jahrhundert* (Berlin, 1888).—Goury du Roslan's *Essai sur l'Histoire Économique de l'Espagne* (Paris, 1888).—Cos Garayon's articles on *La Mesta* in the *Revista de España* (vols. ix. and x.).—M. Ansiaux, "Hist. de la Décadence économique de l'Espagne," in *Révue d'Écon. Pol.*, 1893-94.—The leading legislative enactments have been collected in the 3rd book of the *Nueva Recopilacion de las Leyes de España.*] E. CA.

METALS, PRECIOUS. See GOLD; PRECIOUS METALS, Discoveries of; SILVER.

MÉTAYAGE; MÉTAYER, called in legal phraseology *colonat partiaire*—an expression taken from Roman law—refers to a cultivator who pays his rent in kind: it is a particular method of *fermage* or farming land. *Métayage* differs from *fermage* in that the rent, instead of being paid in *money* and *fixed* throughout the whole period of the lease, is paid *in kind*, and consequently *varies* with the yield itself; a portion of the yield, usually the half, being set aside for this purpose.

This arrangement is very usual in certain countries, as in Italy, Portugal, the countries bordering on the Danube, in Russia, and also in France. In France, out of 33 million hectares cultivated (nearly 82,000,000 acres), 4½ millions (11,000,000 acres)—14 per cent—are managed on the *métayer system*, 27 per cent under the usual arrangements for farming; the remainder, 59 per cent, being cultivated by the proprietors themselves. In Italy, out of less than 11 million hectares cultivated (27 million acres), 5½ millions, or 50 per cent, are managed on the *métayer* system.

Métayage appears to have been much more in use formerly than at present. Arthur Young, at the time of the revolution, estimated the land cultivated on this system in France to be ⅞ or 87 per cent of the whole. From this continued decrease it might be concluded that *métayage* is an antiquated institution, condemned sooner or later to disappear.

It is true that *métayage* seems better adapted to poor districts, and that it may be in time superseded by *fermage*, that is by money rents, or by the proprietor cultivating his own land himself, in proportion as the district becomes richer and the cultivation better, that is, more intensive. The *fermier*, in fact, is always a capitalist, and even, more generally in England, a fairly large capitalist, while the *métayer* generally has no capital, and possesses nothing but his labour and some agricultural implements of little value. He tills the ground himself and avoids everything connected with an expensive mode of cultivation, what is called in France *la culture intensive*, for what good would there be in his spending, for instance, £100 more a year to increase the raw product by £200? He would only get the half of this product (£100), and in consequence would not gain a penny. On the other hand the owner himself hardly cares to invest a large capital in working the farm, for the dividing by half the addition to the raw product arising from the employment of this capital, would be too disadvantageous to him.[1]

However, if *métayage* appears inferior to *fermage* from an economic, it is superior to it from a moral point of view. And this superiority has been sufficient to maintain the institution in many countries, and even now rallies round it more supporters perhaps than formerly. This moral superiority springs from the following causes:

(1) While *fermage* establishes enmity between the owner and the *métayer*, *métayage* establishes a unity of interests between them. Both share alike in good and bad fortune; there is a real association between them, and it is one of the oldest and most admirable forms of PROFIT SHARING which those who see in co-operation the solution of all social difficulties should regard with favour.

(2) The *métayer* is never straitened by the mode of payment, because he pays in kind. He only gives the proprietor what the earth itself gives—nothing, if it yields nothing—much if it yields generously. He never has to pay the landlord anything out of his pocket.

On the other hand the *fermier* is always compelled to provide the money even when the land yields him nothing, is often straitened, and comes to regard the proprietor as an oppressor, a kind of tax-collector.

(3) The *métayer* is guaranteed against injurious exploitation to which the *fermiers* so often find themselves exposed through competition among themselves, which sometimes raises the rent to an exorbitant amount (rack rent).

Métayage, by its customary fixing the division of the product into halves, wards off completely the influence of competition on price, quenches all controversy as to the amount of the rent, and does not permit the proprietor to monopolise all the profit (FAIR RENTS, *q.v.*).

(4) *Métayage* gives better assurance of a long duration of lease than *fermage*. In *fermage*, as a matter of fact, the owner is always seeking for a new *fermier* who will pay him a higher

[1] This may be modified by a certain standard of farming being required by the *usages locaux*.

rent than the former tenant. But in the *métayer* system, what is the good of a change of *métayer*, since the rent is the same whoever be the tenant? The owner has no reason for dismissing his tenant, or at least none but personal reasons. There are *métayer* farms which remain constantly in the same family, passing from father to son, as in the Limousin is stated to have been the case for 300 years.

(5) Finally in *métayage* the owner necessarily takes much more interest in the cultivation of the land and the success of the harvest—since his share depends on it—than in *fermage*, as in this case he receives his rent in money whatever occurs. Hence intercourse is more intimate and even familiar between the owner and the *métayer*.

For all these reasons the *métayer* system may be considered as an element of social peace and capable of solving in certain cases the agrarian question.

Moreover, the contract according to the *métayer* system can be modified according to the circumstances, and thus lends itself better to the exigencies of an improved culture. For example there might be a system of *métayage* in which the *métayer* would provide more or less considerable capital. This is the case in the south of France, and assists the planting of some large vineyards there. The proprietor merely provides the ground; the *métayer*, the "vine-dresser" as he is termed, plants this at his own expense, employing large capital, but the vintage is divided with the owner only after the 5th or 7th year. A system of *métayage* might also exist in which the landowner would advance the capital, stipulating for the payment of a moderate interest, and this might assist a solution of the problem of agricultural progress. In a word the time-honoured system of *métayage* might be re-instituted in different ways and adapted to new requirements, while still keeping those essential characteristics which are its great recommendation, namely that it forms an "association of gains and losses" as defined in the old French law.

[H. Higgs, "Metayage in Western France," *Economic Journal*, March 1894.—Du Maroussem, "Métayers du Confolentais," *Ouvriers des Deux Mondes*, 1890.—Vladimir Pappafava, "Étude sur le colonage partiaire," *Bulletin de la Société de Législation Comparée*, June 1885.—*Discussion à la Société d'économie politique de Paris sur le métayage: compte rendu dans le Journal des Économistes*, April 1891.—A. Caird, *Report on India*, 1880, p. 6.—Roger Merlin, *Le métayage et la participation aux bénéfices*, Paris, 1898.—Emile Guillaumin, *La vie d'un simple; Mémoires d'un métayer*, Paris, 1805.]

G. G.

MÉTAYER, in West Indies. The métayer system of cultivation has an interesting example in some of the West Indian colonies—notably Grenada, St. Vincent, and Tobago, where it is also termed "métairie" or "métayage." It was introduced for the purposes of sugar cultivation when these islands were under French rule, and has subsisted to this day. Up to 1887 or 1888 there had been very little friction between the owners and métayers, but about that time certain judgments of the then chief justice of Trinidad and Tobago caused a stir in the latter island, and in 1889 a committee investigated the whole question of the relations of the two parties to the contract. The contract had originally been, as a rule, a *parol* agreement; there had recently been a tendency to employ written agreements, and in 1888 the legislature of Tobago had proposed to regulate the contract by local ordinance.

The agreements between landowner and métayer vary considerably in their details, but their usual outline is as follows:

(*a*) The *landowner*—
- (1) provides land for sugar cultivation,
- (2) at crop time gives the use of mill and machinery, carts and mules, or one of these, and also provides certain skilled hands for manufacture.

(*b*) The *métayer* undertakes—
- (1) to cultivate the land to the best of his ability,
- (2) to keep the roads across or around his land in good repair,
- (3) to give his labour on other parts of the estate at a fixed rate for certain days in each month,
- (4) to resign to the landowner half the sugar made from his land, besides a considerable proportion of the molasses.

The proportions with which the produce is divided are not always the same; but a fairly even division is the basis of the arrangement.

The system has never been the economic success which one might have hoped; the sugar was usually roughly manufactured, and owners complained that their mills and boilers were often damaged. But it has been useful where, as in Tobago, there has been great dearth of floating capital to pay the wages of labour.

C. A. H.

METHOD OF POLITICAL ECONOMY.

(*a*) Scope of Economics, p. 739; (*b*) Economics and General Sociology, p. 741; (*c*) Divisions of the Science, p. 741; (*d*) Formal Economics, p. 741; (*e*) Narrative Economics, p. 742; (*f*) Constructive Economics, p. 743; (*g*) Inductive Methods, p. 744; (*h*) Deductive Methods, p. 746; (*i*) Criticism and Combination of Methods, p. 747.

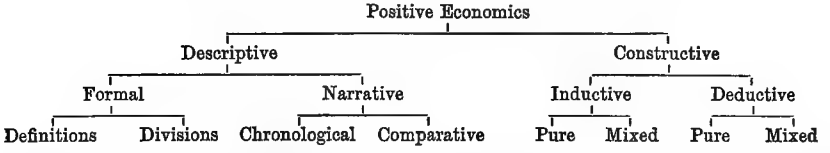
(*a*) *Scope of Economics.*—Before treating of the various methods applicable to economic investigation, a brief examination of the scope of political economy is necessary. It is almost universally agreed that economics deals with wealth, or, more precisely, with those human

activities the end of which is the appropriation of wealth. But admitting this common standpoint, there are yet two different directions in which economic study may proceed. The science may aim at merely ascertaining facts or at directly regulating conduct—its propositions may be couched either in the indicative or in the imperative mood. On the former view economics is called a positive or theoretical science, on the latter a regulative or practical science. But, whichever of these two views is taken, a further distinction must be made according as the propositions of the science have an abstract and general or a concrete and special application. The precepts of regulative economics, and the uniformities of positive economics, cannot be immediately applied to the guidance of conduct or the interpretation of phenomena. For every rule must be modified in consideration of the peculiar conditions of the society and epoch to which it has to be applied; and the recognition of the single pursuit of wealth must be qualified by consideration of other ends and motives. Thus the precepts laid down by the regulative science may be either *general, i.e.* applicable to all societies, or *special, i.e.* having reference to the particular conditions of a given society. And again they may be either *abstract, i.e.* restricted to the consideration of a single end, such as the maximising of production, or the equalising of distribution; or *concrete, i.e.* prescribing a due co-ordination and subordination of different human ends. Similarly, the facts described by positive economics may be either of *general* applicability to all societies, or may take account of the peculiarities of *special* social institutions and forms of civilisation. And again they may treat of men in an *abstract* form, so far as they pursue wealth alone; or in a more *concrete* form, as subject to various influences that conflict with the pursuit of wealth.

Although the distinction between precepts and facts—between a regulative and a positive science—has been maintained as essential, especially by British economists from SENIOR onwards, yet there are some grounds for merging the two aspects in a single treatment. In the first place, a precept may always be expressed as a conditional uniformity—"If such conduct is adopted, such a result will follow," *e.g.* if pauperism is encouraged, the average wages of the working man will be lowered. The reader may then be left to his own judgment to decide whether the result in question or its avoidance is desirable. Secondly, in many cases there is practical unanimity in regard to the desirability of certain ends. Other things being equal, greater wealth, or the more equal distribution of wealth, may be assumed as a desirable result. Agreement as to the end in view is more particularly obvious in technical problems, such as banking, currency, state finance, and taxation. In the third place, it may be urged that the aims of individuals as well as governments are determined by their ethical ideals; and that therefore it is impossible, or at least undesirable, to separate the actual from the moral aspect of human pursuits. For these reasons it may be maintained that the distinction between the positive and the regulative sides of economic study is less fundamental than that between its abstract and its concrete aspect. In the actual course of discussions on method, it has been often supposed that the positive treatment of the science will necessarily assume an abstract character, and that the regulative treatment must assume a concrete character. For those writers who have aimed at regulating conduct in the interests of a given society have naturally recognised the need of examining its complex conditions; and those who are only concerned with theorising on economic phenomena have naturally tended to treat in isolation the single pursuit of wealth. In the latest development of the controversy, it has been acknowledged by the more impartial writers on both sides that there is room for work in all fields. The ultimate aim of economic investigations is, no doubt, practical, *i.e.* to guide conduct in the actual conditions of affairs. For this purpose we must understand the operation of causes in the society in which we move. But, further, we require a general estimate of the comparative values of different ends of human pursuit. And, in order to understand the particular facts of any one individual society, we need the guiding principles of general theory. The propositions of economics expressed in their most accurate form will be doubly conditional, thus: "Given such or such a constitution of society, if such or such measures are taken, such or such a group of effects will follow." Of the effects produced some will be desirable, others undesirable. To determine whether the balance is towards the good or the evil, some reference to ethical considerations is necessary. Again the results to be anticipated from any course of action depend on the nature of the society for which the measures are proposed. Complexity of conditions and complexity of effects have thus to be taken into account. As a basis of practical economics we need, on the one hand, a general theory of the action of industrial forces; and, on the other hand, an ethical survey of the value of human ends. The former is a necessary preliminary for the explanation of the concrete facts of society, and the latter for the discovery of right rules of conduct appropriate to these concrete facts. It follows, then, that a *science* of economic causes and effects must precede the *art* of political economy; and that this art is related to the science in the same way as any branch of applied knowledge is related to the corresponding theoretical knowledge.

(*b*) *Economics and General Sociology.*—Although the name political economy is still preserved, the science, as now understood, is not strictly *political: i.e.* it is not confined to relations between the government and the governed, but deals primarily with the industrial activities of individual men. On the other hand, the science does not deal with individuals, *qua* individuals. It is not, therefore, in any sense a branch of psychology. Even when it discusses the utility of objects of desire, and the sacrifice incurred in procuring them, it only measures utility and sacrifice, not subjectively, but as embodied in objective form. Hence the subject matter of economics gives it a place among the social, rather than the political or the psychological, sciences. Being admittedly a social science, the question has arisen as to its relations with other social sciences, and its position relatively to general sociology. Some writers, under the influence of COMTE, have maintained that economics cannot be profitably treated at all as an independent branch of study. They hold that there is such an intimate consensus amongst all the causes and effects of social life, that it is impossible to isolate any one group of phenomena—such as the industrial—and to treat this apart from the others. On this view economic facts cannot be explained without taking into account all concurrent causes, and rules for economic guidance cannot be formulated without taking into account all concurrent effects. All thinkers allow that no one group of social phenomena is completely isolated from another. But, in answer to the extreme Comtist view, it is urged that there are certain kinds of effects which are predominantly due to a single kind of cause, and that there are certain kinds of causes which produce a single predominantly important kind of effect. So far as this is true, the explanation of economic phenomena and the regulation of economic conduct may be treated independently of other sides of social life. Science has never been advanced except by specialisation. A distinction may, however, be made between two parts of economic doctrine. When the economist attempts to trace the general forms of transformation which economic phenomena present in the course of development, and to make broad comparisons between one society and another, it is true that economic phenomena cannot usefully be treated apart from the influences of religious, moral, intellectual, and political conditions. But when tracing the modes in which industrial forces operate under given social conditions, he need not enter into a scientific analysis of these conditions, and, assuming them to be relatively stable, he need not analyse the slow and gradual changes which they undergo. In brief, even though the theory of economic *evolution* may properly be subsumed and absorbed under the general science of social evolution, yet the doctrine of what may be called the statics and dynamics of industrial forces is rightly treated in entire independence of other branches of social science.

(*c*) *Divisions of Economic Science.*



Putting aside the ethical function of criticising economic ideals, and regarding rules of conduct as properly expressed in the form of conditional statements assigning the connection between measures and their consequences, we may confine attention to economics as a *positive* science that deals with relations of fact. So regarded it falls into two main divisions, which may be called respectively *descriptive* and *constructive*. The former branch describes the conceptions and facts with which the science deals; and the latter establishes laws or uniformities. Descriptive economics again divides into a *formal* and *narrative* branch; of which the former analyses and classifies the conceptions needed for understanding the science in its widest applications, and the latter investigates historically and comparatively the various forms of economic life exhibited by different communities and at different epochs. Constructive economics, again, adopts a method which is either predominantly inductive or predominantly deductive; and under each head we must recognise a mixed method in which induction is modified by deduction, or deduction modified by induction. The above table will serve to show the scheme of the chief departments of economic science.[1]

(*d*) *Formal-Descriptive Economics.*—It must be acknowledged at once that the various departments of economics cannot be treated altogether independently of one another. The descriptions of economic phenomena must be regarded as in the first place provisional, and

the form that they ultimately assume is necessarily dependent on theory. However, a general survey of ideas and facts must precede any investigation into the uniformities and dependencies among economic phenomena. In the formal-descriptive branch a provisional understanding is supplied of such general conceptions as those of wealth, capital, labour, appropriation, exchange, barter, money, and of the various subdivisions into which these conceptions fall. This branch of investigation involves the logical process of *definition* and *division*. Some writers are impatient of discussions of this purely formal character. Questions of definition are regarded as trivial, on the ground that they lead to merely verbal controversies. Definitions are, however, necessary mainly to prevent the confusion so prevalent between controversies about words and controversies about matters of fact or theory. Economics, in particular, has to borrow words from common speech, and common speech is ambiguous; hence, in default of a clearly assigned connotation, the economist is liable to introduce into his own writings confusion, misunderstanding, or inconsistency. Many disputes, for example, about capital have arisen from the failure to observe that different persons understand the term in different senses: and this applies to professed economists as well as to the ordinary man. The problem of definition gives rise to several difficulties. (1) Most of the terms employed, though in current use they cover a fairly understood range of application, are yet without any precise connotation. Definition therefore requires at the outset an *inductive* process of analysis and comparison to discover the characteristics common to all the various applications of the term. Often, however, a term is used so loosely that any possible definition will lead to a modification of its generally recognised scope in the direction either of expansion or of restriction. Nevertheless, the ordinarily understood range of a term in common use ought to be attended to; and it not infrequently turns out that the inductive investigation of popular usage will disclose important points of agreement or difference between classes of phenomena that would probably be overlooked if a more *a priori* mode of definition were adopted. (2) But, secondly, the process of defining a term is further complicated by the fact that some proposition into which the term enters is assumed to be true. For example, in the definition of capital it will be assumed that capital is a form of wealth which co-operates with other independent factors in the production of wealth. The definition of capital from this point of view provides an answer to the question "What other factor besides the raw materials supplied by nature and the efforts of human beings contributes to the production of wealth, and how far can this factor be conceived as independent of the others?" Or the definition of capital may implicitly answer the question "What is the nature of the service to the community and of the sacrifice to the individual which secures the payment of interest?" (3) Again, definitions involve a classification of economic phenomena, and so necessitate consideration whether the resulting classes are mutually exclusive and collectively exhaustive. Now the question of exclusiveness and exhaustiveness cannot be answered on merely logical grounds, but requires an investigation into matters of fact. Indeed the results of any such investigation may vary with variations in the stage of society considered. Hence even definitions partake of the character of relativity ascribed to all economic formulæ. (4) But more important than any other consideration is the question of framing a classification that will subserve the purposes of scientific investigation. Our definitions should lead to the formation of classes of which *universal* propositions of the greatest number and importance can be asserted, and between which the most impressive differences subsist. This latter aim is difficult to achieve because of the continuity of economic phenomena, *i.e.* the fact that different classes imperceptibly merge into one another leading often to limiting cases. The recognition of this principle of continuity is perhaps the most important characteristic of modern economic theory. (5) Definitions have finally to be completed by the construction of a nomenclature and terminology, in which a compromise has to be made between the claims of technical precision and convenience on the one hand, and of current phraseology and intelligibility on the other.

(*e*) *Narrative Economics.*—In narrative or historical economics are included not only accounts of past events in chronological order, but also comparisons between different societies, whether contemporaneous or not. Here we deal with particular facts ascertained by specific experience. In contrast with the *formal* branch of descriptive economics, the historical deals with actual phenomena having a definite position in time and space, and is thus concrete and circumstantial. But even the narrator must *select* his facts, and use his judgment as to what is of importance in reference to the particular species of phenomena which circumscribes his narrative. Again, no mere record of isolated events can be of service to science. The grouping of facts—whether as simultaneous or as successive—must be guided by assumptions of causal connection. In the first place, then, economic history cannot be comprehensible or instructive without a previous survey of the special conceptions systematised by formal economics. But this is not all. As formal economics requires reference to facts in order to procure appropriateness to its conceptions, so history requires reference to ideas in order to secure

coherence and systematisation in its presentation of facts. History is unavoidably coloured by the writer's theories of causal relations. Narrative economics, which occupies a middle position between formal and constructive economics, looking backwards, leads to modifications of the conceptions formulated by formal economics, and, looking forwards, becomes itself subject to modifications from constructive economics. One very important division of narrative economics is *Economic Statistics*. Although the range and implication of the term statistics appear to be very variously understood, yet we may at any rate regard statistics in the first instance as merely a descriptive-narrative department, dealing specially with numerical or quantitative results. The arrangement of such results in a coherent and instructive form requires not only logical and mathematical knowledge of a technical kind, but also special economic acquaintance with the action of industrial forces. The mere descriptive function of statistics is of course subordinate to its function of suggesting or verifying uniformities of cause and effect.

The importance to the economist of a wide knowledge of the various forms of economic institutions and habits that have actually appeared at different times and places, cannot be exaggerated. Some would hold that this historical knowledge is no part of economic science proper; others, that it practically exhausts the whole of the science. Since, however, it is one of the functions of history to criticise theory, and one of the functions of theory to criticise history, it would seem that acquaintance with particular facts and understanding of general laws are so intimately bound up, that there is as much need to protest against the exclusion of history from theory as against the exclusion of theory from history. The historian of industry requires training in economic reasoning, and the economic reasoner requires constant appeal to concrete facts. On these grounds narrative economics should be included as an introductory though necessary part of the whole of economic science.

(*f*) *Constructive Economics.*—The central aim of the science of political economy is the discovery and establishment of general truths relating to industrial life. The uniformities investigated may be divided on several different principles. Perhaps the most important distinction is that previously alluded to between *laws of industrial development* and *laws of the statics and dynamics of industrial forces*. The former department is a branch of the science of social evolution:—the science which traces regularity in the tendencies according to which one stage of society is in the course of time supplanted by another. This study necessarily regards man and society as in some sense organised wholes; *i.e.* it recognises all sides of human and social nature as co-operating towards some end consciously or unconsciously pursued. Not only are comparisons instituted between different stages of the same developing community, but also between any different communities that offer examples of different stages of development. On the other hand, the interactions between industrial forces present problems of an entirely different kind. Here the general condition of the society to which the investigation relates is accepted as a *datum*, not accounted for as a result of development. Hence in this treatment, no elaborate analysis of the various sides of social life is necessary. Whether it be the play of competition or the *vis inertiæ* of habit and custom, whether it be legalised serfdom or *laisser faire* that is assumed as the dominant characteristic of the society, either hypothesis is taken merely as a starting point for further investigations. Associated with this distinction of scientific aim is the distinction of scientific method. There is a natural alliance between laws of development and an inductive method based exclusively on experience; and a similar alliance between laws of interaction and a deductive method based mainly on calculation. Nevertheless there have been not a few writers who have treated evolution by highly *a priori* methods, while there have been many writers working with a fixed background of social conditions who have used the method of specific experience. In short, we have no right to identify the theorems of evolution with the inductive method, nor the theorems of dynamics with the deductive method. There is another distinction, viz. that between *abstract* and *concrete* economics which is liable to be identified with the distinction between the deductive and the inductive methods. By an abstract treatment of economic problems, is meant one in which the forces in operation are fictitiously simplified for purposes of investigation or exposition. The deductive method necessarily *begins* with an abstract treatment; but, in its complete form, qualifying conditions are gradually introduced which render the treatment approximately truthful to the real complexity of human life. The inductive method, on the other hand, begins with the complexities of actual economic conditions; but as it mounts up to higher and higher laws its statements become more and more general and, therefore, in a sense abstract. Pure induction starts with concrete detailed instances as its data, or premisses, and works up from these to uniformities of increasing simplicity. Pure deduction starts with abstract elementary principles as its data or premisses, and works down from these to uniformities of increasing complexity. The former passes from statements of greater to those of less circumstantiality; the latter from statements of less to those of greater circumstantiality. Symbolically from such premisses as "*ab* is *pq*, *ac* is

pr, *bc* is *qr*"; induction infers that "*a* is *p*, *b* is *q*, *c* is *r*"; while deduction infers the former from the latter. But no known writer has ever confined himself to the method either of pure induction or of pure deduction. There are two ways in which the methods of induction and deduction mutually co-operate in science; firstly, either method may be used to confirm or refute the *conclusions* of the other; and secondly, either method may be used to control or determine the *premisses* of the other. As to the former point, the term *verification* is usually given to an *a posteriori* confirmation of a deductively inferred result; and the term *explanation* to an *a priori* confirmation of an inductively inferred result. Whether the treatment of a question is to be called inductive or deductive depends on the preponderance of intellectual labour involved. If this be chiefly devoted to the collection, description, and comparison of facts, the method would be characterised as inductive; if to the consideration of alternative possibilities, the calculation of forces in combination, and the tracing out of chains of effects on general principles, then the method would be characterised as deductive. In induction the writer relies mainly on the number and variety of the instances cited, and on the degree of circumstantiality with which each case can be described in both its quantitative and its qualitative aspects. But here the results cannot be safely applied except within a narrow range of experience. Hence the need of *a priori* confirmation, which will often determine the limits of applicability of the empirically obtained uniformity. In deduction, the writer relies on exactness in the statement of postulates, exhaustiveness in the survey of alternative possibilities, and thoroughness in the tracing out of a chain of effects dependent on any postulated change. But here the result must be regarded as expressing only a *tendency* which may or may not be realised in the actual complexities of life. Hence the need for an *a posteriori* confirmation, which will transform the statement of a mere tendency into one of realised fact. It should be specially noted that the confirmation by one method of a result reached by the other does not usually amount to an independent establishment of it. For the examples brought forward to confirm an *a priori* deduction may often be few and incompletely analysed; and the principles adduced in confirmation of an *a posteriori* induction may often be indeterminate and incompletely synthesised. A method is to be characterised as inductive or as deductive, according as the form in which *facts are analysed*, or that in which *principles are synthesised*, is the more logically cogent. We next examine how either method is used in regulating the *premisses* of the other method. The premisses of the deductive argument are conclusions derived from observation, which may be either of a very general kind, or of a more special kind applicable to a given state of society and dependent on scientific analysis of economic phenomena. Such premisses refer either to the action of single isolated forces, and thus supply major premisses or principles; or else to the particular conditions of the society under consideration, and thus afford minor premisses. Somewhat in the same way as induction supplies premisses for deduction, so the results of deduction determine the form assumed by the premisses of the inductive process. For in order to bring facts together to any purpose, it is necessary to know in general outline the agency of economic forces. The relation of cause and effect does not involve merely or necessarily contiguity in space and time. Hence the collector of facts needs the guidance of theory in order that his analytical descriptions may include all that is relevant and exclude all that is irrelevant.

(*g*) *Inductive Methods.*—The inductive method rests on a collection, analysis, and comparison of concrete instances, with the view of discovering, within the range of observation, uniformities that may be extended beyond that range. The instances are collected as they agree or differ in respect to some one circumstance, which it is sought to connect causally with some other circumstance. There are thus two fundamental methods of induction, that of *agreement* and that of *difference*. Each of these methods assumes several subordinate forms, and these varieties of form may be combined so as to increase the cogency of any inference. In the method of difference, we infer with respect to some circumstance in which the compared instances *differ* from one another; in the method of agreement, with respect to some circumstance in which the compared instances *agree* with one another. In the method of difference it is essential that the instances compared shall *agree* with one another as closely as possible in all circumstances not known to be irrelevant; in the method of agreement, that they shall *differ* from one another as far as possible in all such circumstances. Expressing the methods symbolically, in comparing instances AB and AC, when the conclusion relates to A, we are employing the method of agreement, when to B or C, the method of difference. For example, if we compare two countries resembling one another only in the fact that both have adopted a policy of free trade [A], and infer that their prosperity is due to this policy, we are employing the method of agreement. If we compare two countries differing from one another only in the fact that one has adopted free trade [B] and the other protection [C], and infer that the superior or inferior prosperity of one is due to this difference of policy, we are employing the method of difference. It should be pointed out that the functions of the

two methods are not precisely identical. The method of difference proves—not that the differential circumstance would in *all* cases be efficient—but only when conjoined with the accompanying circumstances of the case. By this method alone it is impossible to discover how many of these accompanying circumstances were part-agents in producing the effect observed. It is therefore impossible to determine the range over which the causal relation may be extended. In order to *generalise* with respect to any one circumstance, we require the method of *agreement*, by which all other circumstances are shown to be irrelevant. Thus, if we can find a sufficiently varied group of strikingly prosperous communities, agreeing with one another only in the adoption of FREE TRADE, we have evidence that free trade *under any circumstances* will lead to prosperity. Causal connection in any single instance can only be proved by the method of difference, while a generalisation or uniformity can only be established by the method of agreement. The latter method determines, within certain limits of probability, the range over which we may extend any causal connection otherwise established. The explanation of this contrast is as follows: The law of causation tells us that *total agreement* between the causes operative in two instances would ensure *total agreement* between their effects; and conversely. Hence, if there is a *partial difference* between the effects in two instances, there must always be at least a *partial difference* between the causes; and conversely. This principle is that upon which the method of difference rests. On the other hand, it is not in general true that a *partial agreement* between the effects manifested in two instances would ensure even a *partial agreement* between their causes; and conversely. The method of agreement is, therefore, not absolutely reliable, since it depends on a principle which is not universally and without qualification valid. The two methods of agreement and of difference are necessary to supplement one another; the latter being required to establish *causal* connection in a single instance and the former to establish *uniformity* of connection.

Since, however, we can seldom fulfil the requirements of either of the two methods, we must practically have recourse to the *joint method*. Here we collect two sets of instances—one circumstance that is present in every instance of the first set being absent, or otherwise modified, in every instance of the second set. The more closely any pair of instances taken from the two sets agree, the more nearly we approach the requirements of the method of difference; and the more the instances in each set vary among themselves, the more nearly we approach the requirements of the method of agreement.

So far, in analysing the above methods, reference has been made to circumstances as simply *present or absent*. But the most important applications of induction are—not to mere *qualitative* agreement or difference—but to *quantitative* agreement or difference. Precisely the same methods apply to quantitative variations as to qualitative presence or absence, except that instead of taking only *two* instances, or two *sets* of instances of presence and absence respectively, we take any number of instances, or any number of *sets* of instances, in each of which a different magnitude of the variable quantity is presented. This method is called the *method of concomitant variations*. If the instances taken agree in all respects except in the magnitude of the variable quantity, the method is a mere extension of the *method of difference*. But the case in which instances are arranged in *groups*, according to the magnitude of the quantity present, is an extension of the *joint method*. This, in fact, constitutes the *complete method of pure induction*. Instances are arranged in separate heads, according to the various modifications of which some phenomenon is susceptible. Instances under each head, agreeing in some particular modification, are chosen which shall *differ* as far as possible as regards other accompanying circumstances; while instances under different heads are chosen which shall *agree* as closely as possible in regard to all other accompanying circumstances. When, from such a group of instances it is found that one variable quantity remains constant whenever another is constant, and differs when the other differs, we have the highest, purely empirical, ground for inferring causal connection between the two quantities.

The complete method of pure induction not only assigns causal connection between two phenomena on the ground of the concomitance of their quantitative variations, but it further determines the *law* according to which the variations in the one phenomenon follow variations in the other. Thus, if the method could be applied to economic data, not only would it establish a causal relation, say, between the price of corn and the marriage-rate, but it would determine the one quantity as a *function* of the other. Similarly, in connecting the price of corn with the amount supplied. To elicit, from a number of arithmetical data, the most probable law of variation involves special mathematical and logical canons, for which the articles on STATISTICS; LEAST SQUARES, METHOD OF; AVERAGE, etc., should be consulted.

Theoretically, the chief difficulty of applying pure inductive methods to economic phenomena is owing to the *composition of causes*. An effect in the economic world is invariably due—not to one kind of cause—but to the co-operation and interaction of a number of different causes, which all contribute to determine the actual phase or degree manifested in the effect. Hence,

by mere observation, it is impossible to detect the underlying agreement in different instances of the effect of any one cause,—the effect due to this one cause being modified through intermixture with the effects due to others. Instances compared according to the method of difference are not, however, in the same way vitiated by the action of the composition of causes. If the force operative in two instances, otherwise similar, differs in kind or intensity in the two instances, then any observable difference in the effect may be ascribed to this difference in the cause, although other forces may be operating in conjunction with that observed. A special variety of the method of difference applied to cases of composition of causes, is called the *method of residues*. This method is partly of an *a priori* and deductive character. It applies to cases in which the effects of all but one of the causes in operation are known, both as regards number and magnitude. If then, the actually produced effect is compared with that which would have been produced by the composition of the causes whose effects are known, the difference will determine the amount due to the cause in question. A simple example in economics of the method of residues is supplied by examining the rates of exchange of foreign bills. If the rate of discount current at the time is known on *a priori* or independent grounds, then a comparison between the exchange and the rate of discount will determine how much of the effect is to be put down to the temporary inequality of mutual indebtedness between the countries.

(*h*) *Deductive Methods.*—The character of the results reached by the deductive method will depend mainly upon the nature of the data or postulates which are assumed as premisses. It would not be possible to enumerate all the assumptions that have been made by different economists and for different purposes, but there are some half dozen which may be taken as typical and almost universally applied. Of these six data, two belong to each of the divisions, physical, psychological, and social. (1) The two physical or natural laws presupposed are the law of DIMINISHING RETURNS, which arises from the necessity of having recourse to inferior agents of production, or to their use under less advantageous circumstances; and the law of INCREASING RETURNS which results from the increased possibilities of industrial organisation under extension of supply. Both these laws represent *tendencies* ascertained by ordinary observation, which work in opposite directions. Hence more exact knowledge as to the magnitude of the forces in particular circumstances has to be supplied by further detailed observation. (2) The two psychological data are general expressions of the nature of DEMAND and of SUPPLY, so far as these depend on the characters of individuals. The law of demand is to the effect that the utility afforded by any increment of any kind of desired object diminishes with increase of the amount possessed: the law of supply is to the effect that every one tries to procure material well-being with the least possible sacrifice. These assumptions are common to almost all economic reasonings of a deductive type, though they are not always explicitly formulated. Here, as in the case of the physical presuppositions, further detailed observation is required to determine the precise degree in which these psychological forces act under any circumstances. In particular, the law of supply requires to be made more definite by an estimate of the influences of habit, inertia, ignorance, or custom, which materially affect its application. (3) The two sociological data relate to the conditions of freedom and restraint under which the economic activities of a community take place. Speaking generally, it is assumed on the one hand that individual action is controlled by certain legalised institutions with regard to property, and, on the other hand, that individuals are free to act according to their own will within certain limits. A similar remark applies here, as before, namely that the precise degree of freedom or of restraint, operative under any circumstances, has to be determined by specific observation. In analysing the postulates of deductive economics, reference is generally made to *competition*; but under this term a good many ambiguities are concealed. Competition is sometimes used to exclude any form of combination; but abstract economics does not exclude any form of combination which individuals may find it to their interest to enter into. Again, competition sometimes implies merely legislative freedom for every one to act for his own interest; but at other times it implies that equal remunerations are secured for equal services. Now this latter depends on the *effectiveness*, not on the mere *freedom*, of competition. Again, freedom of competition may imply the absence — not merely of governmental interference—but also of all sentiments, habits, or dispositions which might check the active pursuit on the part of every one of his own interests. There is a distinction between the restraints imposed by the social and legal environments and those due to psychological and individual character. Now, with respect to all these and similar presuppositions of deductive economics, considerable difference of opinion has arisen as to their validity or import. Some writers hold that they are of universal application, though, of course, requiring further determination by specific observations of particular communities (cp. Jevons, "The Future of Political Economy," *Fortnightly Review*, vol. xxvi. p. 625). Others hold that they express tendencies only which are liable to be counteracted by various forces of a secondary

kind (cp. Mill, Cairnes, etc.). Others, again, hold that the postulates of economics relate to societies within a narrowly limited range, viz. those which have reached the most highly developed and complicated form of industrial organisation (cp. Bagehot, *Economic Studies*, pp. 19, 20). Lastly, some have held that the premisses of deductive economics are absolute fictions, applicable to no society of individuals that has existed or ever could exist (cp. F. Harrison, Cliffe Leslie). The truth is that, without further modification, few of the conclusions of deductive economics can be applied to the explanation or regulation of concrete circumstances; but that the method is necessary for controlling and guiding inductive observation. Moreover, the different postulates of deductive economics have different values in relation to different classes of phenomena. In some cases many more qualifications are needed than in others. These qualifications suggested by inductive observation can often be introduced into the deductive process itself. But, in any case, the limits of validity of deductively reached results must be examined by comparisons with experience; and in this consists the importance of deduction, checked, tested, and confirmed by induction.

(*i*) *Criticism and Combination of Methods.* In political economy *induction* alone is inadequate for the following reasons: (1) There is hardly any scope for experiment, whereby the effect of a single cause coming suddenly into operation in the midst of an unchanging environment could be observed. (2) The cause of any effect consists always of a conjunction of a large and intricate number of conditions which cannot be measured or empirically observed in separation. (3) The effects produced are often at first inappreciable; and cannot in any case be looked for until long after the first introduction of the cause. (4) Hence the effects are continually liable to be modified and interfered with by other co-operating or conflicting agencies, which come into operation after the special cause under investigation. On the other hand, *deduction* alone is inadequate for the following reasons: (1) The data or first principles of the science cannot be ascertained with quantitative exactness. (2) The character of the objects to which the science applies is liable to fundamental changes, so that there is no permanent basis upon which calculation can rely. (3) Even in a stationary society, the kind and degree of qualifying circumstances that modify the results cannot be known *a priori*. (4) No principle is known, like the parallelogram of forces in physics, according to which the effects of various forces in combination can be calculated.

In face of these obstacles to cogent inference by either the inductive or the deductive method, the fact that so much has been written in political economy which professes to employ one or other of these methods requires explanation. The answer is to be found in the consideration that much of what has been written comes rather under the *descriptive* than under the *constructive* head. Much of what is called deductive economics concerns itself with the preliminary process of clearing up misconceptions and presenting alternative possibilities in an exhaustively systematic form. So far as inferences have been worked out, they have merely made explicit what is involved in the postulates assumed at the outset, by carrying them to their inevitable consequences. This work of clearing up ideas, in so complicated a subject as that of the interaction of industrial forces, is so difficult, that no amount of care and trouble is thrown away in attempting to execute it efficiently. On the other hand, much of so-called *inductive* economics is concerned with the process of enlarging one's views of the varied forms in which economic life has been manifested from time to time, and of presenting problems from experience for theory to solve. So far as inference has been here introduced, it has consisted mainly in propounding a mere *suggestion* that, where agreements or differences have been observed, there is probably some causal connection which theory is required to explain. Such work is also extremely useful. What can alone be called *constructive* economics—involving genuine inference from the known or postulated to the unknown—has actually involved the co-operation of deduction and induction. Here, again, there is room for workers of opposite tastes and abilities, for we may still distinguish a method that is predominantly inductive but aided by deduction from one that is predominantly deductive but aided by induction. In the former, the facts of history are collected and prepared in the light of general theory, and an explanation of their connections is sought for on universal *a priori* principles. In the latter, the principles assumed are chosen on the ground of general conformity with experience, and a verification of the conclusions inferred is sought for in specific experience. So far as inductive generalisation fails to receive confirmation from indubitable general principles, it is led inductively to examine its facts more comprehensively. And so far as deductive calculation fails to receive confirmation from indubitable particular experiences, it is led deductively to apply its principles more concretely. Thus each method may learn from the results of the other without losing its own distinguishing characteristics.

[The English works in which the subject has been exhaustively treated are J. N. Keynes, *Scope and Method of Political Economy*, and J. E. Cairnes, *Character and Logical Method of Political Economy*. But almost all systematic writers on political economy have dealt more or less incidentally with the question of method. Without pro-

fessing to supply an exhaustive bibliography, the following important works may be mentioned:—

METHUEN TREATY. Portugal had been closely allied with England since the marriage of Charles II. with Catharine of Braganza (1661) and the recognition of Portuguese independence (1668) to which English arms and diplomacy had essentially contributed. But when the great question of the Spanish succession was raised in 1700, Pedro I. of Portugal was induced by France to acknowledge the Bourbon claimant, Philip V. It was a notable success for the Grand Alliance when, in 1703, Portugal deserted the Bourbon cause and joined in the war as a partisan of the Archduke Charles. In the negotiations which led to this change of sides a prominent part was taken by John Methuen, the English envoy at Lisbon. Methuen now seized the opportunity to secure commercial advantages for England by reopening the Portuguese market to English wool, which had been excluded from that country since 1680 in the hope of encouraging native agriculture and manufactures. On 27th December 1703, he succeeded in concluding the brief but famous treaty which has immortalised his name. It consists of two simple and straightforward articles: British woollen manufactures are to be admitted into Portugal on the same terms as before the prohibition, provided that Portuguese wines shall pay in Great Britain a duty one-third less than that charged upon wines from France. For more than seventy years this treaty was consistently observed, with the result that the cultivation of the vine was vastly extended in Portugal, and that in England port superseded burgundy as the ordinary wine drunk by the gentry. The treaty was regarded as specially advantageous to England, because a large portion of our exports were paid for in the gold which Portugal derived from Brazil. Hence the mercantilists reckoned that the balance of our trade with Portugal was more favourable than that of trade with any other country. This contention led Adam Smith to make a special attack upon the Methuen Treaty, which he condemned on three grounds: (1) British capital could have found more advantageous employments than the Portuguese trade into which it was artificially attracted; (2) we gave differential advantages to Portuguese wines, while Portugal promised none to English woollens; (3) England was forced to undertake the burdensome task of defending a very weak ally against Spain and France. It is undoubtedly true that the disadvantage at which French wines were placed in the British market contributed to strengthen and prolong the hostile feelings between France and England during the 18th century.

The first blow to the Methuen Treaty was dealt by the great Portuguese minister, Pombal. The market for British goods was restricted by sumptuary laws and by the systematic protection of native industry. In 1767 it was reckoned that our exports to Portugal had fallen from £1,500,000 to £735,000, and that the balance of the precious metals had sunk to £105,000. The dissatisfaction thus created facilitated Pitt's negotiations with France, and art. 6 of the famous commercial treaty of 1786 stipulated that "the wines of France, imported directly from that country, shall pay no higher duties in Great Britain than those now paid by the wines of Portugal." This was a virtual abrogation of the Methuen Treaty, but the subsequent outbreak of the long wars with the French republic and empire prevented the new agreement from being fully carried out. During the war, Portuguese wines paid 9s. 1d. a gallon and French wines 13s. 9d., and thus port retained its ascendency over burgundy and claret during the early part of the present century. In 1825 the duties were reduced,

but the same proportion was retained, and it was not till 1832 that Lord Althorpe, as chancellor of the exchequer, carried the equalisation of duties upon foreign wines at 5s. 6d. per gallon. In 1836 Portugal formally released England from the obligations of the Methuen Treaty.[1]

[Adam Smith, *Wealth of Nations*, bk. iv. ch. 6.—Macpherson, *Annals of Commerce*, vol. ii. —Leone Levi, *History of British Commerce*.]

R. L.

METRIC SYSTEM—ENGLAND. The action of England in respect to the metric system of weights and measures has been characterised by precisely the same slowness and vacillation as has been described under the heading of DECIMAL SYSTEM in relation to coinage. Had it not been taken up, with more or less of zeal and perseverance, by various private individuals in the last hundred years, no English government or its executive would have so much as given it a thought. Space compels us to do no more than briefly refer to what was done during the second half of the nineteenth century. Entirely through private agitation, and mainly through that of the Metric Association, founded in London by some few leading men of science and business, a parliamentary committee was named in 1862 for the consideration of suggested reforms in our system of weights and measures. They recommended, with unanimity, a cautious but steady introduction of the metric system, and its legalisation, but not compulsorily until sanctioned by the general conviction of the public, and that a department of the board of trade should undertake the care and verification of the standards under the new system, and spread the knowledge of it in government departments and among the people, and use it alongside the present system in levying customs duties and in government contracts. It was also to be made one of the subjects for examination in competitions for entering the civil service. The *gramme* was to be used as a weight for foreign letters and books at the post-office. The metric system was to be taught in all schools receiving grants of public money. The recommendation of the International Statistical Congress, as to its use in our public statistics, was adopted; this was that its use should be allowed in private parliamentary bills, and metric and imperial measures exclusively used until the former came to be generally adopted. A bill was introduced into parliament to make the chief of these recommendations compulsory at a date to be fixed, say at end of three or more years. In committee the government objected to the compulsory provision, and substituted a permissive bill which was agreed to, and became the "Metric Act" of 1864. In 1868 a bill, afterwards abandoned, was brought in to introduce the metric system by compulsion, after a period to be inserted by government. In 1871 a bill with the same object was introduced, but Mr. J. B. Smith, then member for Stockport, who had long laboured with the Metric Association in discussing and arranging the terms of this bill, was defeated on a second reading by a majority of five. In the last quarter of the century, mainly arising from the decease of some of the most active and influential members of the Metric Association, and partly from the few survivors being tired of the apathy of the general public on this question, there arose a certain positive retrogression in the interest taken in it. At the close of the century a new body, under the revived name of the Decimal Association, again took it up, and a parliamentary committee, after resuming the task of taking evidence, reported almost unanimously in favour of legalising the metric weights and measures immediately, and of making their use obligatory at the end of two years, with provision for teaching the system in the meanwhile in every public school as a necessary and integral part of arithmetic. It would be a welcome sign of progress, if, in the public advantages expected to accrue from the recently elected strong government and executive, these recommendations were allowed to result in a complete reform. This ought, however, in our opinion, to be extended also to coinage, as if so important a step in the commercial and daily life, and in the education of the people, be once taken, it should not be in a piecemeal, but in a complete manner. The precedents of other European countries should be kept in view. They have not feared the change, but, greatly to their advantage, have successfully carried it through.

F. H.

METRIC SYSTEM (FRANCE, etc.), the system of weights and measures established in France by the law of 18 germinal, year III. (17th March 1795), and since adopted by a great number of other countries. The idea of a scientific basis for a standard from which all weights and measures could be derived had been put forward a century earlier by the astronomer Picard. The unit he proposed for his standard was the length of a pendulum, beating one second at the sea-level at forty-five degrees of latitude. No uniform system of weights and measures then existed in France, and although the *toise*, and the *livre*, were common expressions, the length of the one, and the weight of the other varied in the different provinces, and even between towns of the same province. A general reform of the

[1] Contemporary opinion differed as to the effect of the impost.

"Firm and erect the Caledonian stood,
Good was his mutton and his claret good.
'Let him drink port,' the English statesman cried.
He drank the poison and his spirit died."

Contra:—

"Drink the port; the claret's dear, Erskine, Erskine.
Ye'll get fou on't, never fear, my jo Erskine."

various systems was one of the desiderata contained in several of the "cahiers" submitted to the *États Généraux* which preceded the revolution of 1789, and the subject was taken up by the constituent assembly on a proposal by Talleyrand. By a royal decree of the 8th of May 1790, the king of England was to be invited to appoint a commission of savants to meet one of French academicians, and determine the length of the pendulum, as proposed by Picard. Political events prevented the execution of this project, but the French academy of sciences named a committee formed of Borda, Lagrange, Laplace, Monge, and Condorcet, to carry out the work. That body, however, set aside Picard's plan of the length of a pendulum as the basis of the new system, as well as a proposal to take a fraction of the length of the equator, and adopted as the initial measure, to be called the mètre, the ten millionth part of a quarter of the terrestrial meridian, with decimal multiples and divisions. There, however, remained to determine the length of the quadrants. Many savants had, during the century, taken measurements of parts of the meridian, but the results differed considerably. Picard fixed the length of the degree at 57,060 toises of six feet. Some astronomers put the degree as high as 57,422 toises, others as low as 56,750. Fresh surveys were ordered, and Delambre and Méchain were charged in 1792 to measure the arc of the meridian between Dunkirk and Mont Jouy near Barcelona. Those limits were selected as being at about equal distances, the one from the north pole, the other from the equator, each extremity being at the sea level. The result of their labours, which spread over a period of seven years, was to fix the distance from the poles to the equator at 5,130,740 toises, a ten millionth part of which was taken as the standard mètre. The length of the degree according to their calculation was 57,008 toises, differing but slightly from the 57,060 toises obtained by Picard more than a century earlier. A committee of weights and measures was then appointed to complete the work, by composing a system of weights and measures based on the metre, with decimal multiples and divisions. To indicate the multiples the Greek prefixes, *deca* ten, *hecto* a hundred, *kilo* a thousand, and *myria* ten thousand, were adopted; and for the divisions, the Latin, *deci* a tenth, *centi* a hundredth, *milli* a thousandth. A *décamètre* is consequently a lineal measure of ten *mètres*, a *décimètre* a tenth of a mètre, a *kilomètre*, the ordinary measure of road distances, one thousand mètres, a *millimètre* a thousandth of a mètre. Other measures and weights are derived from the mètre. For surface measurement the unity is the square of a mètre on each side; with the multiples square décamètre, having sides of ten mètres, and the divisions of a square decimètre, or sides of one-tenth of a mètre, etc. For land measurement, the square décamètre, containing 100 square mètres, is called an *are*, and 100 ares, or 10,000 square mètres, an *hectare*. For solids the principal measure is the cubic metre of a square mètre on each of the six faces, the same bulk of water forming the ton weight of liquids. The *litre* is a thousandth part of the ton, or a measure having a tenth of a mètre, or ten centimètres on each face. The weight unit is also derived from the measurement of liquids, a cubic centimètre, or cube of one hundredth of a mètre on each face of distilled water, at the temperature of greatest density, forming the *gramme*; a thousand grammes make the *kilogramme*, or French double pound, which is the principal commercial unity of weight. The division of the mètre and the gramme into one thousandth parts, the *millimètre* and the *milligramme*, permits calculations of great nicety, and those weights and measures are now commonly employed in the sciences and industrial arts in countries which have not adopted the metric system generally.

Comparative tables of the English equivalents of the French weights and measures are to be found in most books of arithmetic and works of reference, and it will suffice here to state that the mètre is 39·370 inches, or 1·093 yards; the litre, 61·027 cubic inches, or 1·760 pints; the hectolitre, 2·751 bushels; the gramme, 15·432 grains; the kilogramme, 32·150 ounces troy, or 2·204 pounds avoirdupois; the square mètre, 10·764 square feet; the hectolitre, dry measure, 2·751 bushels; the kilolitre, or ton measurement 35·316 cubic feet. Conversely the English inch is 0·025 metres; the yard, 0·914 mètres; the mile, 1609·31 mètres; the square yard, 0·836 square mètres; the acre, 0·404 hectares; the pint, 0·567 litres; the gallon, 4·543 litres; the bushel, 36·347 litres; the grain, 6·479 centigrammes; the ounce avoirdupois, 28·349 grammes; the pound, 453·592 grammes; the cwt., 50·802 kilogrammes. In the above equivalents decimal figures beyond three in number are omitted.

The metric system was definitely constituted by a law of the 10th December 1799, and became compulsory from November 1801, but did not apply to the currency. The famous law of the 7th Germinal year xi. (28th March 1803), however, established the monetary system on its present bases, the weight of the coin being fixed in grammes with decimal subdivisions of the franc into decimes and centimes, or tenths and hundredths of the franc. The new system had to contend with old habits and prejudice. The population continued to employ old names adapted to divisions of the new weights and measures, such as a foot of a third of the mètre, an *aune* or ell of 1·20 mètres, a pound of 500 grammes, an *arpent* or acre of two-fifths of an hectare, etc., and those infractions of the law

were tolerated by successive governments until a law was passed in 1837, interdicting, from the 1st January 1840, under severe penalties, the use of any other weights and measures than those of the metric system. The principal exceptions to the use of the metric or decimal system in France, are in the divisions of time, and the measurement of angles, for which the old numeration is preserved, and all attempts to bring those quantities into concordance with the system have been abandoned. Absolute perfection is difficult, and the original idea of taking for the standard a certain and incontestable lineal measure has not been completely realised. Since the first mètre was cast in platinum, and deposited at the archives in an iron safe, secured with four locks, other measurements of the meridian have been taken, and have proved that the real length of the quadrant is 5,131,180 *toises*, or 440 more than obtained by Delambre and Mechain. The latter of those savants is said to have himself discovered an error in his calculations, but did not dare to reveal it for fear of raising doubts on all the work of the commission. The mètre has remained as first established, in spite of that imperfection.

An international convention met in Paris in 1875, and decided on the formation of a permanent bureau of metric weights and measures. The countries represented were France, Belgium, Italy, Spain, Portugal, Sweden and Norway, Germany, Austria, Switzerland, Denmark, Russia, Turkey, the United States of America, Argentina, Peru, and Venezuela. England did not send any delegate, but gave her adhesion in 1884, and some other states, including Japan, have since joined in. The international bureau is established in a government building, in the park of St. Cloud, with a permanent staff charged to make and provide prototypes of the mètre and the kilogramme, the expense being borne in common. Besides the original mètre, preserved at the Paris archives, exact reproductions are also deposited at the Observatory, and the Conservatoire des Arts et Metiers. The international prototypes are made of 90 parts of platinum, and 10 of iridium, and have a length of 102 centimetres, the mètre being marked by indented lines at one centimètre from each end. Most of the states above named have adopted entirely the metric system, others, including England, have legalised it, while a third class of states have decimal monies, weights, and measures, not concording with the metric system, but which are a step towards it, and will facilitate a future adhesion to it. The merits of the system as a whole are so universally admitted that they do not require to be demonstrated.

[P. Leyssenne, *Traité d'Arithmétique.*—Larousse, *Grand Dictionnaire du xix^e^. Siècle* (*s.v.*)—Duvergier, *Collection des Lois et Décrets depuis* 1788.]

T. L.

METROPOLIS, MANAGEMENT OF (see also COMPANIES, CITY OF LONDON). For purposes of local government London is divided into two distinct areas, the City of London—formerly the City and County of London—and the modern administrative County of London. The former comprises the area within the old city walls, and some districts near, in all some 673 acres, about one square mile, with a population by day (1891, the latest census) of 301,384, and by night 26,923 (1901). The corporation of the City of London consists of the lord mayor, the two city sheriffs, the court of aldermen, and the court of common council. The elective bodies are the liverymen and the ratepayers. The LIVERY are the freemen of the city companies or gilds, which are now (1904) 77 in number, and have 9083 members, who are entitled to vote in common hall. The ratings are 11,280 in number, giving 32,647 municipal voters, the total assessment being £5,105,874. The aldermen, 26 in number—one for each ward,—are chosen by the ratepayers, and hold office for life. The alderman for the ward of Bridge Without is not elected by the ratepayers of that ward, but the seat, when vacant, is taken, generally by seniority, by one of the other aldermen, whose ward immediately elects a fresh representative. The ratepayers also elect common councilmen, varying from 4 to 16 for each ward, and amounting in all to 206, who hold office for one year only, the elections taking place annually on St. Thomas's Day. The lord mayor, who must previously have served the office of sheriff, is chosen annually, on the 29th September, by the court of aldermen, from two members of their own body selected on the same day by the liverymen in common hall. Both the selection of the livery and the choice of the aldermen usually fall upon the next in seniority. The two sheriffs are also elected by the livery. From the time of Henry I. the livery possessed the right to elect both the city sheriff and the sheriff of Middlesex, but by the Local Government Act of 1888 the last-named right was withdrawn, and the citizens now elect two sheriffs for the city.

The corporation has complete and exclusive powers of local government throughout its own area. It maintains and controls its own police, and administers justice at the Guild Hall and Mansion House. It appoints judges to hold courts of assize for criminal cases at the Old Bailey—the aldermen being justices of that court, and throughout the city, and having, besides, special powers enabling any of them to do alone any act which in any other place requires the presence of two justices of the peace. The court of aldermen holds licensing sessions for the city. It also appoints judges for the trial of civil causes in the City of London Court, and the Mayor's

Court, the latter having exclusive jurisdiction in a variety of causes arising out of city customs, and also in causes in equity, if arising entirely within the city. The court of aldermen holds separate meetings for its special duties, but for administrative purposes the aldermen sit in common council with the councillors, and have equal powers.

The Administrative County of London comprises urban and suburban districts outside the city boundaries, extending for some nine or ten miles on every side. It extends over some 121 square miles, and contains an area of 74,839 acres, not including the city, with a population (1901) of 4,536,541. This area was formerly without any joint or corporate administration, its local government being entirely in the hands of the vestries of the different parishes, but by the Metropolis Local Management Act of 1855 the metropolitan board of works was established, with powers for drainage, sewerage, lighting, cleaning, and general improvements. By the Local Government Act of 1888 this body was superseded by the London County Council, with extended powers of government over the same area under the title of the Administrative County of London. This body consists primarily of 118 councillors, who are elected by the electors of the parliamentary boroughs in the metropolis, including the city, the number of councillors for each division being double the number of members it returns to parliament. The councillors at their first meeting elect a number of aldermen, not exceeding in all one-sixth of their own number. From this enlarged body they elect a chairman, a paid deputy, and a vice-chairman. All the members of the council sit together, and have equal powers. The councillors hold office for three years, and retire all together. The aldermen hold office for six years, nine or ten of them retiring every three years. At present (1905) there are 118 councillors including the chairman, and 19 aldermen.

The funds of the council are raised by levies upon the different parishes and districts within its area, all parishes paying an equal rate per £1. The rateable value (1905) is £41,647,310. By the Equalisation of Rates Act 1894, a rate of 3d. in the pound may be made half-yearly to form an equalisation fund, which is to be distributed among the parishes on the basis of population. It has also power to raise money by loan, and the gross debt amounts (1905) to £71,587,175, including £18,061,140 in loans to different vestries and school boards.

For judicial purposes the London County Council has power to direct, with the approval of the home secretary, the holding of quarter sessions for the county of London, and has the right to petition the crown to appoint a chairman therefor. The chairman of the county council is a justice of the peace *ex officio*.

The sheriff of the county of London is appointed by the crown in the same way as the sheriffs of Middlesex and other counties.

For educational purposes it was administered by the London school board, established under the Elementary Education Act 1870, whose district was the same as that of the London County Council. By the Act of 1903 the care of education was confided to the London County Council, who act through their education committee, which consists (1905) of 38 members of the council, with 10 co-opted members, of whom five are ladies.

For general criminal jurisdiction the county of London is in the district of the Central Criminal Court: a district comprising 269,14 acres, say 420 square miles including the city with a population (1901) of 6,101,664. The Central Criminal Court holds quarter sessions and sessions every month. For police jurisdiction the county of London is comprised, by act of 1829, in the Metropolitan Police District, which extends over a radius of 1 miles from Charing Cross, and covers 442,74 acres, or 692 square miles, not including the city, having a population (1901) of 6,554,449 The metropolitan police are under the direct control of parliament, acting through a commissioner appointed by the home secretary One-half of the cost of police is voted by parliament, and the other half is raised by precept upon the different parishes according to rateable value.

Many important matters relating to the health of the metropolis, such as fever and small-pox hospitals, and the care of imbeciles are under the control of the metropolitan asylums board, one-third of whose members are nominated by the local government board the remainder being elected by the various bodies of poor-law guardians.

Matters relating to the port of London and the river Thames are in the hands of the city corporation as port sanitary authority, and the Thames conservancy. This body consists of 38 members, of whom 8 are nominated by the corporation, and a like number by the London County Council.

The water-supply is controlled by the Metropolitan Water Board created by the act of 1902, which consists of 66 members, of whom 14 are nominated by the London County Council and the remainder by different municipal bodies interested.

The vestries of the different parishes within the county of London were, by the act of 1899 superseded by borough councils, to the number of 29, which consist each of a mayor, and certain number of councillors, not to exceed 60 who have power to elect aldermen not exceeding one-sixth of their number.

The lieutenancy of London is in a commission named by the crown under the privy seal, and under act of 1673, and consisting of the members and chief officers of the corporation, but not all of the councillors, and other merchants and bankers of the city who are recommended by the lord mayor. The court of lieutenants has the same powers with regard to the reserve forces as the lords lieutenant of the counties. R. W. B.

METZ NOBLAT. See DE METZ-NOBLAT.

MEUBLES. See IMMEUBLES.

MEYNIEU, MADAME MARY (died in 1877); an Englishwoman by birth, married to a Frenchman. She became a widow after fifty years of wedded life, but continued to live in France. Highly cultivated and accomplished, she was one of the few women who have written on political economy, and she was highly successful in popularising the science.

Her principal works are: *Eléments d'économie politique*, a statement in a series of dialogues between a teacher and pupil for the use of the primary normal schools, Paris, 1839, 8vo.—*Histoire du paupérisme anglais*, 1841, 8vo.

MÉZAGUES, VIVANT DE (18th century), believed to be the author of a "letter" on the general condition of England, under the initials M. V. D. M., is stated by his translator to have been at the head of the finances of France (*c.* 1754-60). The object of the "letter" is to show that the wealth and trade of England were not greater than those of France. With this view the author examines into the balance of trade between England and other countries (including Ireland), the national income and debt, exchanges, imports and exports of bullion, war expenditure, etc. He concludes that England, after having been a gainer by her trade during the 17th century, was in 1761 a loser from a monetary point of view. He supports his argument by statistics from official and the best private estimates, and carefully considers objections. He calculates that the "territorial income" of England about 1760 was £20,000,000 sterling; also that from two-fifths to a third of the national debt was held by foreigners.

Bilan général et raisonné de l'Angleterre, depuis 1600 jusqu'à la fin de 1761; ou Lettre à M. L. C. D. sur le produit des terres et du commerce de l'Angleterre, par M. V. D. M., 1762; translated into English under the title *A general view of England respecting its policy, trade, commerce, taxes, debts, produce of land, colonies, manners, etc., argumentatively stated from the year 1600 to 1762, in a letter to M. L. C. D. by M. V. D. M.*, London, 1766. [See Andrew HOOKE.]

[Coquelin and Guillaumin, *Dictionnaire de l'Économie politique*, Paris, 1854.—R. Giffen, *Growth of Capital*, London, 1889.] R. H. H.

MICHAELIS, OTTO (1826-1890), was successively a journalist, a member of the Prussian chamber of deputies, of the imperial *Reichstag*, and a councillor of the German chancery. He was one of the most steadfast and brilliant representatives of the German free-trading party; when Prince Bismarck's leanings towards a protective policy became notorious, he resigned his office in the imperial chancery, but was placed at the head of the board of the *Invalidenfonds*. He was with Julius FAUCHER (*q.v.*) one of the founders of the *Vierteljahrschrift* and an honorary member of the Cobden Club.

After having published a book against the state monopoly of railways (*Das Monopol der Eisenbahnen* 1861), Michaelis later on showed himself willing to make concessions on this subject; his *Volkswirthschaftliche Schriften*, 2 vols., 1857, which deal with the management of railways, the commercial crisis of 1857, commercial speculations, public loans and banking, and his contributions to the *Vierteljahrschrift*, deserve to be noticed. In his chapter on value (*Das Kapitel vom Werthe*), which first came out in the same periodical, he states that the notion of value is purely subjective, and springs from the efforts to be made in order to get possession of a thing, leaving aside the further purpose of exchange. He was a strong opponent of a fiduciary circulation of bank-notes. E. CA.

MICHEL, FRANCISQUE (1809-1887), editor of the first volume of the Gascon Rolls (*Rôles Gascons*) in the *Collection des Documents Inédits*, of municipal records of Bordeaux, etc. His writings, chiefly on antiquarian subjects, are numerous.

His *Histoire du Commerce et de la Navigation de Bordeaux* (2 vols., Bordeaux, 1867-68), entirely based on local and on national (English and French) records, is highly esteemed and full of information on the intercourse between Bordeaux and England during the period of English dominion.

E. CA.

MIDDLEMAN. A "middleman," in the broadest sense, is one through whose hands goods pass from one trader to another or to a consumer. Owing to the inaccurate habits of thought prevalent respecting economics, the term has acquired a dyslogistic meaning in consequence of the considerable profits which are frequently made by the persons or corporations included under it. The middleman is supposed in some mysterious and blameworthy manner to have insinuated himself between the producer and the consumer, taking an exorbitant profit from both, and various wild schemes have from time to time been devised for "eliminating the middleman" who is figured by half-educated people as a person with no real *raison d'être*, since he performs no useful function. This idea is, in the main, absurd, but like most widely spread opinions it is based on a truth. To get rid of *all* intermediate agencies between producer and consumer is a dream which even the most rabid assailant of the middleman would admit to be impossible of realisation, but there is no doubt

that in certain cases middlemen continue to obtain business long after the economic justification for their existence has ceased. To do what has always been the custom is easier than to strike out a new path, and for this reason people follow the old ways in their daily business unless a very great advantage can be shown to result from a change.

CO-OPERATION as applied to DISTRIBUTION is a device, and a very effective device, for getting rid of a number of middlemen. Various attempts have been made to "bring producer and consumer together," especially in the case of agricultural produce, the profits of the salesman, in the case of meat especially, being supposed to be excessive. They probably are in many cases; for though retail tradesmen are fierce competitors one with another in large towns, their competition does not take the form of cutting down prices to any serious extent, and in small towns a practical monopoly of the supply of such articles as meat often exists. Moreover, the strong demand arising from the wants of the big towns, especially London, tends to keep up prices, for the London salesman would be quick to take advantage of any unusual cheapness. It is, however, difficult to avoid the conclusion that middlemen are essential to nearly all businesses involving movements of commodities over considerable distances, and as there is competition even among them, their profits cannot be more, on the average, than the services rendered justify, though occasionally an excessive profit may be made for a time. W. H.

MIDDLE PRICE. Dealers on the stock exchange, when asked the price of a given security, sometimes say, "87 middle," or some other middle price, at which they are not prepared to deal, but which is half way between the prices which buyers offer and sellers are prepared to accept. A middle price is therefore not a formal QUOTATION (*q.v.*), although transactions are sometimes based on it (see also MARGIN). A. E.

MIL. The 1000th part of a monetary unit. It is perhaps more frequently applied to the United States dollar than to any other coin. The smallest United States coin issued appears to be a copper half-cent, of which $39,926.11 coined by the mint of Philadelphia were stated to be outstanding in 1894. These half-cents each = 2½ mils. The value of the mil is about ⅛ of 1 farthing.

[*Report of the Director of the United States Mint*, 1894. The mil was proposed as the smallest coin of the DECIMAL SYSTEM (*q.v.*) Some comments on the use of the mil will be found in Bagehot, *A Universal Money*, pp. 45-62, 2nd ed. 1889.]

MILL. A mill is properly "an engine or machine for grinding or comminuting any substance" (Webster), and is an implement of great antiquity, its rudimentary form being preserved in the quern or hand-mill from time immemorial used for grinding corn, and occasionally to be met with still in remote places. At what period in the history of ancient civilisation mills of a larger construction began to be used is uncertain; but a persistent tradition, founded on a remark of Strabo's, points to the first water-driven corn mill as having been in use near the palace of Mithridates, in Asia Minor, who died 63 B.C. Such mills were introduced into Britain by the Romans, and were common throughout Europe during the middle ages. Gradually they were applied to other purposes, to grinding colours, crushing oil, and sawing stone and timber. Later still a use was found for them in connection with metal manufacture; as an alternative to hammering by hand; and in textile manufacture, in the special process of *fulling*,[1] or pounding cloth. At the time of the introduction of the modern FACTORY SYSTEM their utility was extended in a variety of directions; and about the same time that astonishing series of mechanical inventions commenced which resulted in the possibility of *spinning*, and at length of *weaving*, by machinery. The places where these operations were performed seem to have been called at first mills or factories indifferently, partly, we may judge, because of the extension of their utilities in these directions, partly because many old mills—corn mills and fulling mills—were then turned into factories. The earlier factory acts, accordingly, made no distinction between these terms, and the original technical signification of the former seemed in some danger of being lost in this connection. Subsequently the term mill was dropped, except in certain specific relations which are defined, as *mill-gearing*, *iron mill*, but a survival of this confusion of nomenclature may still be noted in the factory districts, where that part of a textile manufactory where spinning is carried on is often spoken of as distinctively the mill, whilst the part where weaving is performed is called the factory, with obvious reference to those earlier meanings.

[John Beckman, *History of Inventions*, articles "Corn Mills," "Saw Mills" (Bohn's edition).—R. W. Cooke-Taylor, *Introduction to a History of the Factory System*, ch. i.] R. W. C. T.

[1] "The operation of *fulling* bore a sufficiently near resemblance to the earlier and proper processes of mill work, not to appear utterly foreign from the older conception of a mill, and was in fact sometimes called 'milling,' in obvious accord with this view. Soon, however, the term began to include other processes more remote. In 1551 complaint is made to parliament of the establishment of 'gigge mills'—contrivances, that is, for raising a *pile* or *nap* on cloth, a process, therefore, wherein little trace of the original meaning of the word 'mill' remains; and at length *winding*, *spinning*, and a variety of operations dealing with the treatment of fibrous material are found spoken of as performed in mills; operations wherein the original technical signification is altogether lost" (Cooke-Taylor. *Introduction to History of Factory System*, p. 11).

MILL, JAMES (1773-1836) was born in the village of Northwater Bridge, Forfarshire. His father was a shoemaker. His early years were exempted from the drudgery of manual labour by the discerning partiality of his mother. He was sent to the university of Edinburgh at the age of seventeen, and having completed the usual studies, became licensed as a preacher. But abandoning this career, Mill went to London in 1802, and supported himself by literature. He married in 1806, and in course of time had a family of nine children—"conduct than which nothing could be more opposed," as his son says, "to the opinions which, at least at a later period of his life, he strenuously upheld." Struggling and burdened as he was, he had the energy to compose a great book, *The History of India*. The publication of this work in 1818 led to Mill's obtaining a lucrative appointment in the India office. His position in the office continued to rise in dignity and emolument up to his death.

Mill's earliest work was economic, *An Essay on the Impolicy of a Bounty on the Exportation of Grain and on the Principles which ought to regulate the Commerce of Grain*, 1804; a rare pamphlet which, from M'Culloch's notice of it, seems to have referred to the restrictions on the trade between England and Ireland. In 1807 he wrote *Commerce defended: an Answer to the Arguments by which Mr. Spence, Mr. Cobbett, and others, have attempted to prove that Commerce is not a source of National Wealth*, which led to his acquaintance with Ricardo. The advantages of the territorial division of labour are well expounded; but the following view of the gain by international exchange appears less orthodox: "Whenever a cargo of goods of any sort is exported, and a cargo of other goods bought with the proceeds of the former is imported, whatever the goods imported exceed in value [*i.e.* money-value, as the context shows] the goods exported beyond the expense of importation is so much clear gain to the country." In 1808, reviewing Thomas Smith, "Money and Exchange" in the *Edinburgh Review*, Mill asserts the principle that money is a commodity, and thus describes its uses. "First we go to market with money. Secondly, we account by means of it. . . . Abstract ideas or ideal standards are of no use in going to market," or for any other purpose. Some years later (1816-23) Mill contributed several articles to the supplement to the *Encyclopædia Britannica* (1823), of which the most famous, criticised by Macaulay, *Edinburgh Review*, 1829, is that on *Government*. The articles in the Supplement which most deserve notice here are on *Banks of Savings*, *Beggars*, *Benefit Societies*, and *Colonies;* containing strong assertions of the Malthusian doctrine (see especially p. 246 of *Supplement*, vol. i.). The article on *Economists* treats only of the political principles of the French school.

Much of the matter contained in the writings which have been referred to is presented in a summary form in Mill's masterpiece, *Elements of Political Economy*. This composition originated in 1819, as J. S. Mill tells us, in instructions given to him by his father in the course of their daily walks. The abstracts of these lessons, prepared by the son, served the father as notes from which to write his book, which was published in 1821. A second edition—considerably altered—appeared in 1824; a third in 1826. Several of the alterations in the third edition were founded on criticisms made by J. S. Mill and his friends. Although the book, in J. S. Mill's words, "has now for some time finished its work," it is still interesting as a type of the classical political economy (J. S. Mill's *Autobiography*, p. 121). The capable author proposing "to compose a schoolbook of political economy" (Preface) "an epitome of the science" (ch. iii. § 10), and professing "to have made no discovery" (Preface), is naturally regarded as the interpreter of his contemporaries, especially of Ricardo his intimate friend (cp. Prof. Ashley on the *Rehabilitation of Ricardo*, *Economic Journal*, vol. i. pp. 478-479). Admirable as the work is, considered as a summary representation of received theories, there are two features of the original which seem to be exaggerated in the miniature picture (1). With M'Culloch, James Mill represents value as depending wholly on quantity of labour (cp. M'Culloch, *Principles of Political Economy*, pt. iii. § 1). He explains away the part played by *waiting* (as we should now say). "If the wine which is put in the cellar is increased in value one-tenth by being kept a year, one-tenth more of labour may be correctly considered as having been expended upon it." . . . "How then can it [time] create value? Time is a mere abstract term. It is a word, a sound" (*Elements*, 2nd ed. p. 97-99). This view is criticised with just severity by S. BAILEY (*Critical Dissertation on Value*). (2) The theory of population as presented by James Mill appears particularly dismal; owing partly to his very precarious "proof that capital has a less tendency than population to increase rapidly" (*Elements*, ch. ii. § 2, art. 3), partly to his not taking sufficient account of improvement in the arts of production. "The grand practical problem, therefore, is to find the means of limiting births." A more original feature is the proposal to tax additions to rent—J. S. Mill's "unearned increment."

Upon the whole political economy, as treated by James Mill, may afford one of the advantages which he claims for the science in the dialogue entitled "Whether Political Economy is useful" (*London Review*, 1836) namely, contemplative

pleasure. Even Dr. Ingram allows to the *Elements* "the character of a work of art." But Mill's work does not afford another advantage which he claims for political economy in the same dialogue, namely, a "comprehensive commanding view" such as that by which a general is enabled to realise his practical purpose. James Mill's work in political economy, as in politics, seems to be vitiated by the excessive use of deductive reasoning—what his son calls the geometrical method (*Logic*, bk. vi. ch. viii.). His principal services to political economy were indirect—to have instigated Ricardo to write (see J. S. Mill's *Autobiography*) and to have been the father and the teacher of J. S. Mill.

MILL, JOHN STUART.

Early Works, p. 756; *Essays on some Unsettled Questions of Pol. Ec.*, p. 756; *Principles of Political Economy*, p. 757; Other Works, p. 763.

John Stuart Mill (1806-1873), was the eldest son of James Mill, by whom he was educated. The teacher was exacting, the pupil precocious; and John, at a marvellously early age, attained proficiency in all the principal branches of learning, particularly the speculative sciences. At the age of thirteen he received from his father peripatetic lectures on political economy; and it must have been about the same period that, in his own words, "Mr. Ricardo invited me to his house and to walk with him in order to converse upon the subject" (*Autobiography*, p. 54). At the age of sixteen he wrote in the *Traveller* in defence of Ricardo and James Mill, his first appearance in print. He contributed frequently to the *Westminster Review*, which was started in 1824, thirteen articles, he says (*ibid.* p. 97), of which only some are specified by him. Those on the game laws, the law of libel, and the corn laws, attest the versatility and precociousness of the writer. Among the "reviews of books of political economy," which he speaks of having written, may probably be placed the review of the *Critical Dissertation on Value* (by S. Bailey) in the fifth number of the *Westminster* (Jan. 1826). The relation of cost of production to value is, according to the writer, like the relation of the pendulum to a the movement of a clock—a regulator, not a cause. "Demand is the cause of value." The issue between the author of the *Dissertation* and James Mill as to the influence of Distance in Time on value is avoided.

Other youthful essays were published in the *Parliamentary History and Review*, the first two numbers of which relating to the sessions 1825 and 1826 are to be found in the Bodleian. The first contains—beside the article on the *Catholic Association*, acknowledged by Mill (*Autobiography*, p. 118)—some remarks on combination and combination laws (*Review*, for 1825, p. 730), which may perhaps be attributed to Mill. The theory that "the rate of wages must in the long run depend on the relation between the capital of a country and its population," is employed to prove the impossibility of raising general wages by combination. The second number contains an article headed *Paper Currency — Commercial Distress*, justly referred to in the *Autobiography* (*loc. cit.*), as an "elaborate essay." The remarks on theory and experience (*Review*, for 1826, pp. 654-659), and on the "double standard" (*Hist.*, p. 659) are characteristic. This essay and that on the Reciprocity principle in Commerce are described by Mill (in his *Autobiography*) as "original thinking." They were not, however, included by him among the articles which he has republished in his *Dissertations and Discussions*. Among ephemeral writings which have not been reprinted may be noticed the *Notes on Newspapers* in the *Monthly Repository* of 1834. They evince that rare union of qualities which he himself has characterised as "practicality" and devotion to "large generalisations" (*Autobiography*, p. 190). Referring to the then burning question of trades unions, he maintains that workmen cannot keep up the rate of wages by combination, but that they ought not to be prevented from learning this by experience (*Monthly Repository*, 1834, pp. 247, 366, 435).

Meanwhile the young philosopher had cultivated his dialectic powers by taking part in debating societies, formed largely but not exclusively of the followers of Bentham. The picked band which used to meet in the morning in Grote's house "brought out new views of some topics of abstract political economy." To this origin Mill refers the first and fourth of the essays, which are contained in the *Essays on some Unsettled Questions of Pol. Econ.* . . . These *Essays* were written in 1829 and 1830, but (with the exception of the fifth, which appeared in the *Westminster Review*) they did not find a publisher till 1844. The *Essays* deserve to be studied as anticipating, and sometimes transcending, the *Political Economy*.

Of the first essay the substance, and in large part the very words have been embodied in the great chapter in the *Political Economy* on "International Values" (bk. iii. ch. xix.), and in the

important section which deals with protection (*ibid.* bk. v. ch. iv. § 6). With this should be read the passages in the preface to the *Essays*, which expresses the opinion that the relaxation of non-protective duties beyond what may be required by the interest of the revenue should in general be made contingent upon the adoption of some corresponding degree of freedom of trade by the nation from which the commodities are imported. In the second essay the influence of consumption upon production is stated more fully than in the passages of the *Political Economy* which are below (p. 758) referred to as corrective of a wrong interpretation of the doctrine "Demand for commodities is not a demand for labour." In the third essay there is obtained a definition of wealth as consisting of "permanent sources of enjoyment," and a corresponding definition of productive labour, more philosophical perhaps than the definitions which in deference to popular opinion have been adopted in the *Political Economy* (bk. i. ch. 3). The fourth essay explains and corrects Ricardo's doctrine that "profits depend upon wages; rising as wages fall and falling as wages rise." The justice of the correction will be evident if we regard "wages" as paid in a money of which the unit is a product of a constant quantity of labour (Ricardo, *Pol. Econ.*, ch. 1, § 6). But this monetary standard is not quite perfect, and the Ricardian proposition is not quite true, unless we use "labour" as short for "effort and sacrifice," and take account of variations in the quantity of *abstinence* or waiting which is required for the production of a unit of the standard (cp. *Memorandum on variations in the value of the Monetary Standard*, Report of the British Association, 1889, § vii.) This refinement is reproduced in the *Political Economy* (bk. iii. ch. xxvi. § 3, but not in the corresponding passage bk. ii. ch. xv. § 7). In the fifth essay the not very epigrammatic definition of *Political Economy* agrees with that which is adopted in the "Preliminary Remarks" of the *Political Economy*. Discussing the method of the science, Mill holds the balance between abstract reasoning and observation. The *a priori* method is the only certain or scientific mode of investigation. But he who does not "sift and scrutinise the details of every specific experiment must rest contented to take no share in practical politics, to have no opinion, or to hold it with extreme modesty," on the applications of his doctrines. There is a most weighty caution against the "danger of *overlooking* something." The only remedy is to place oneself at the point of view of an opponent, and either to discern what he sees or thinks he sees, or make out clearly that it is an optical delusion. A beautiful example of this procedure is afforded in the second of the *Essays*, where Mill points out that the descriptions which have been given of OVER-PRODUCTION are applicable to a commercial crisis.

The method of political economy was further elucidated in the *Logic* published in 1843. His dominant idea is thus expressed: "I always regarded the methods of physical sciences as the proper models for political" (*Autobiography*, p. 165; cp. *ibid.* p. 160).

The combination of *a priori* reasoning from general propositions with specific verification, the direct deductive method, which has proved so successful in mathematical physics is prescribed for political economy (*Logic*, bk. vi. ch. ix.). It is a question whether this view was, or could consistently be, retained by Mill, when he began to doubt the universality of the principle of self-interest, which he once had regarded as the foundation of economic reasoning (*Essays*, p. 138), when under the influence (see also A. COMTE) of the St. Simonians "his eyes were opened to the very limited and temporary value of the old political economy" (*Autobiography*, p. 166), and when, under a more intimate influence, he looked forward to a time when "it will no longer either be, or be thought to be, impossible for human beings to exert themselves strenuously in procuring benefits which are not to be exclusively their own" (*ibid.* p. 230 *et seq.*; cp. on the ultimate premisses of Political Economy, Marshall, *Principles of Economics*, bk. i. ch. v. § 5).

Thus prepared, Mill began his treatise on *Political Economy* in 1845, and finished it in 1847 with marvellous celerity. An analysis of this classical work may be useful.

J. S. Mill's *Principles of Political Economy*, for a work that has been so much read, has been but little commented on. To remedy, in however slight a degree, this deficiency is the design of the following paragraphs.

The preliminary remarks contain a sketch of the progress and a description of the object of political economy. The definition of wealth as "all useful or agreeable things which possess exchangeable value," leaving in uncertainty the question "whether immaterial products are to be considered wealth," should be compared with the discussion of this question in Mill's *Unsettled Questions* (Essay 5), and in one of the chapters of his *Political Economy* (bk. i. ch. iii. § 3). In his earlier view, the "skill and the energy and perseverance of the artisans of a country are reckoned part of its wealth, no less than their tools and machinery" (*ibid.*); but in the later treatise the term is applied only to "what is called material wealth."

The first inquiry about wealth relates to its cause. "The requisites of production are two: labour and appropriate natural objects" (bk. i. ch. i. § 1, par. 1). These are the "primary and universal requisites" (bk. i. ch. i. § 1, par. 1). But since "there is another requisite, without which no productive operations beyond the rude

and scanty beginnings of primitive industry are possible" (bk. i. ch. iv. § 1, par. 1), we may say that "the essential requisites of production are three: labour, capital, and natural agents" (bk. i. ch. x. § 1, par. 3; cp. AGENTS OF PRODUCTION).

A "general survey" (ch. vii., first sentence), of the requisites of production, occupies the first six chapters. The "conceit . . . that nature lends more assistance to human endeavours in agriculture than in manufactures," is refuted in the first chapter. In the first section of the second chapter it is shown how "an article fitted for some human use" (an article of the "first order," as it is now the fashion to say)—such as bread—is produced, partly by labour employed directly about the thing itself—such as that of the baker—and partly by the indirect labours of the reaper, the ploughman, the ploughmaker, who all "ultimately derive the remuneration of their labour from the bread or its price." This important passage is referred to at a more advanced stage, as setting forth the "component elements of cost of production" (bk. iii. ch. iv. § 1). The modes in which labour is indirectly instrumental to the production of a thing are analysed in the remainder of the second chapter; the term "indirect," it may be observed, sometimes importing simply the relation of means to end (§ 1, § 3, par. 1); sometimes, as in the case of savants (§ 8, last par.), that "the material fruits, though the results, are seldom the direct purposes of the pursuits of the savants, nor is their remuneration in general derived from the increased production which may be caused incidentally . . . by their discoveries" (cp. § 7, par. 1).

Capital is defined as the physical requisites of production which are the products of labour (ch. iv. § 1, par. 12; cp. ch. x. § 1, par. 3). The term admits of nice divisions which are traced in the fourth chapter. The "fundamental propositions respecting capital" which form the fifth chapter, may be described without much exaggeration in Prof. Nicholson's words, as "a strange combination of axiom and paradox, of error exposed and truth suppressed, of practical wisdom and unreal hypothesis" (Nicholson's *Principles*, bk. i. ch. vi. § 7). More than one of the propositions at least "expresses his [Mill's] meaning badly"; as Prof. Marshall says (*Principles of Economics*, note to bk. vi. ch. ii.).

The proposition which has most "exercised the ingenuity of all subsequent writers" (Nicholson), is the fourth, that "demand for commodities is not demand for labour." The following is a contribution to the interpretation of this *locus vexatissimus*.

Mill does not mean to deny that consumption is the motive to production. The fact that desire evokes labour is constantly present to him (see Preliminary Remarks, two passages in the middle, pp. 13, 19, ed. 1878, bk. i. ch. vii. § 3; bk. i. ch. viii. § 2, last par.; bk. i. ch. xiii. §§ 1 and 3; bk. iii. ch. xvii. § 5, and cp. *Unsettled Questions*, Essay 2). He may be credited with making two assertions, one correct and one not so. The true lesson to be derived from the passage is that capitalisation is apt to be increased by the postponement of the consumption (Marshall, *loc. cit.*). But it is erroneously implied that "to spend money on the direct hire of labour is more beneficial than to spend it on hiring commodities" (Marshall). *Ceteris paribus* it comes to much the same whether a rich individual spends his money on "velvet" (Mill's favourite instance), or in payment of workmen to roll the "velvet green" (Ruskin). The most serious refutation of this error is that which forms the appendix to bk. iv. of Prof. Simon Newcomb's *Political Economy*. The great difficulties which Mill's doctrine presents may further be illustrated by the parallel passage in Fawcett's *Political Economy*, and by the explanations of the doctrine which are offered by Prof. Sidgwick (*Pol. Econ.*), Prof. Laughlin (Edition of Mill), Mr. Herbert Thompson (*Theory of Wages*), and others.

After the general survey of the requisites of production (bk. i. ch. vii. § 1), we "advance to the second great question in political economy, on what the degree of productiveness of these agents depends" (*ibid.*). Among causes of superior productiveness (chs. vii. viii.) a prominent place is given to combination of labour, or co-operation, including division of labour as a species. Most of the advantages attending division of labour are enumerated in the chapter on co-operation. One advantage described by Jevons as the "multiplication of services" in cases where "nearly the same time and labour are required to perform the same operation on a larger or on a smaller scale" (Whateley, *Lectures on Political Economy*, lecture 6), is postponed by Mill to the chapter on "production on a large and on a small scale" (bk. i. ch. viii.) Two important cases of production on a large scale are presented by joint-stock companies (*ibid.* § 2), and the *grande culture* in agriculture (§ 4). The distinction which Mill draws between gross and net produce per acre (*ibid.*) is vital.

Having considered the means by which the efficacy of the agents of production is promoted (bk. i. ch. x. § 1, par. 1), we proceed to consider the "law of the increase of production" with respect to each of the agents (*ibid.* par. 4). The term "law" applied to the rough generalisations which alone are possible on these subjects is open to criticism (cp. Sidgwick, *Pol. Econ.*, bk. i. ch. vi.).

"The increase of labour is the increase of mankind, of population;" the theory of which is here opened (ch. x.).

The law of the increase of capital (ch. xi.) involves the "effective desire of accumulation," which has been considered in the article on DISTANCE IN TIME AS AN ELEMENT OF VALUE.

The "law of the increase of production from land" (ch. xii.) is what is now called the *law of diminishing returns*. The relation of this law to that of *increasing returns* is thus well expressed by Mill (*ibid.* last par.): "All natural agents which are limited in quantity are not only limited in their ultimate productive power, but, long before that power is stretched to the utmost, they yield to any additional demands on progressively harder terms. This law may, however, be suspended or temporarily controlled by whatever adds to the general power of mankind over nature, and especially by any extension of their knowledge, and their consequent command of the properties and powers of natural agents." The "consequences of the foregoing laws," the dangers of over-population, are set forth in a concluding chapter (bk. i. ch. xiii.). Of Mill's gloomy views on this subject, Prof. Nicholson has said, "surely in the whole range of social philosophy it would be difficult to discover a more striking instance of the overbearing influence of a dominant idea"—considering that Mill himself has given "what is probably the most complete account yet published of the modes in which this law of diminishing returns may be counteracted" (Nicholson, *Principles*, bk. i. ch. x. § 4).

"The principles which have been set forth in the first part of this treatise (bk. i.), are in certain respects strongly distinguished from those on the consideration of which we are now about to enter. The laws and conditions of the production of wealth partake of the character of physical truths." But the distribution of wealth which forms the subject of the second book, is "a matter of human institution solely." "Society can subject the distribution of wealth to whatever rules it thinks best" (bk. ii. ch. i. § 1, cp. *Autobiography*, p. 246). The distinction thus drawn is objected to by Prof. Nicholson (*Principles*, bk. ii. ch. i.) and others, *e.g.* Mr. J. H. Levy, *Outcome of Individualism*, p. 16. But there is surely a very intelligible difference, in degree at least, between the two classes of "laws."

Considering the different modes of distributing the produce of land and labour, Mill compares the institution of private property with communism and socialism, and suggests that "the decision will probably depend mainly on one consideration, viz. which of the two systems is consistent with the greatest amount of liberty and spontaneity" (bk. ii. ch. i. § 3). The following weighty sentence condenses much that Mill has taught in his book on *Liberty*—"it is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlikenesses, that diversity of tastes and talents and variety of intellectual points of view which not only form a great part of the interest of human life, but, by bringing intellects into stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression" (*Pol. Econ.*, bk. ii. ch. i. § 3 end).

Before condemning private property we must consider it not as it is, but as it might be in its best form (*ibid.* penultimate par., cp. L. H. Courtney, "Difficulties of Socialism," *Economic Journal*, vol. i.); which implies the "guarantee to individuals of the fruits of their own labour and abstinence," but "not of the fruits of the labour and abstinence of others transmitted to them without any merit or exertion of their own" (*ibid.*); not unlimited power of bequest, nor unrestricted property in land, nor any proprietary rights in abuses (ch. ii.).

"Private property being assumed as a fact" (ch. iii. § 1, par. 1); we go on to consider the distribution of produce between the three classes "whose concurrence, or at least whose permission, is requisite to production," viz. landowners, capitalists, and labourers—not necessarily different persons (ch. iii.).

"Under the rule of individual property the division of the produce is the result of two determining agencies, competition and custom" (ch. iv.). The cautions with respect to the imperfect degree in which "the natural effect of unimpeded competition" is realised (*ibid.* § 3), may be read with other passages relating to method; such as bk. iii. ch. i. § 5 (guarding against "improper applications of the abstract principles of political economy") bk. ii. ch. xvi. § 4; "the truths of political economy are truths only in the rough"—bk. iii. ch. iv. § 6 (on the danger of "sweeping expressions").

Mill's attempt in the later chapters of the second book to deduce the action of competition on distribution before he has formulated the law of supply and demand which governs that action, is open to grave objection (Marshall, *loc. cit.*).

Mill's recognition of the empirical or historical method is abundantly illustrated by the chapters on *Peasant Proprietorship and Métayers* (bk. ii. chs. vi. vii. viii.), which teem with evidence; out of which, the extracts from Sismondi, Michelet, and Arthur Young may be selected as of permanent interest.

From métayers Mill proceeds to cottiers (ch. ix.), with especial reference to Ireland; and argues that, almost alone among mankind, the cottier is in this condition that "he can scarcely be either better or worse off by any act of his own." The "means of abolishing cottier tenancy," proposed by Mill, have partly passed into legislation. The principle of judicial

rents is thus sanctioned: "rent paid by a capitalist who farms for profit, and not for bread, may safely be abandoned to competition; rent paid by labourers cannot, unless the labourers were in a state of civilisation and improvement which labourers have nowhere yet reached, and cannot easily reach under such a tenure."

It might be difficult to answer the question —why upon the same principle the bargain between employers and labourers should not be sheltered from competition. One answer is afforded by the wage-fund theory, which is stated at the beginning of the chapter on wages (bk. ii. ch. xi.). It was subsequently renounced by Mill (see below, p. 763). But that theory, though left standing in the latest editions of the *Political Economy*, was recanted by Mill in his review of Thornton; when, as Prof. Marshall thinks, "he took to himself blame for confusions of thought of which it is not certain that he had been guilty" (*Principles of Economics*, note at the end of ch. ii. bk. vi.).

The overthrow of the wage-fund theory does not involve the fall of Mill's practical conclusions concerning wages. They are at best strengthened and heightened by that theory (see *e.g.* ch. i. § 6, penultimate par., ch. xii. § 1, pt. iii.). But it is rather on the theory of population set forth in the first book that Mill grounds his rejection of "popular remedies for low wages" (ch. xii.), and his own prescription which is, that the overcrowding of the labour market is to be prevented by "a due regulation of the numbers of families" (ch. xiii.).

Among accessory recommendations should be noticed Mill's preference for an heroic measure, "a sudden and very great improvement in the condition of the poor" (ch. xii. § 4, pt. iv.; ch. xi. § 2, last par.; ch. xiii. § 3, par. 1, § 4, par. 3). "Small means do not merely produce small effects, they produce no effect at all" (ch. xiii. § 4, par. 3).

The chapter on differences of wages (bk. ii. ch. xiv.), in different employments, corrects Adam Smith's classical exposition of the subject. The theory of non-competing groups, commonly ascribed to Cairnes, is implied in § 2 (as pointed out in Prof. Marshall's article in *Fortnightly Review*, 1874). The short passage on the wages of women (§ 5 and end of § 4), has been little improved on.

The chapter on profits is free from certain errors which have been attributed to the classical economy. The function of superintendence is recognised (§ 1). Absolute equality of profits is not postulated. "That equal capitals give equal profits, as a general maxim of trade, would be as false as that equal age or size gives equal bodily strength; or that equal reading or experience gives equal knowledge. The effect depends as much upon twenty other things as upon the single cause specified." Cliffe Leslie himself could say no more (§ 4). In the last section of the chapter, the definition of "cost of labour" demands attention (cp. bk. iii. ch. xxv.), and *Unsettled Questions* referred to above, p. 756.

The chapter on rent (bk. ii. ch. xvi.), taken with the subsequent chapter on *Rent in Relation to Value* (bk. iii. ch. v.), forms a luminous statement of the Ricardian theory. Yet notwithstanding his apparent clearness, Mill is really "a little inconsistent," as Prof. Marshall has said (*Economic Journal*, vol. iii. p. 86), on the fundamental question whether rent enters into the cost of production when there does not exist a no-rent margin of land. The affirmative is distinctly asserted (bk. iii. ch. v. § 2, par. 3); and elsewhere (bk. ii. ch. ii. § 2, par. 1), it is implied that there is an essential distinction between "countries fully occupied," and those which are not. Whereas the distinction appears to be unessential in an earlier passage (bk. ii. ch. xvi. § 4). Rent is said to be an "element of cost of production," under peasant production (bk. iii. ch. vi. § 2).

At length, at the beginning of bk. iii., the theory of value is introduced. Mill's definition of the "value or exchange value of a thing" as its general power of purchasing, the command which its possession gives over purchasable commodities in general" (bk. iii. ch. i. § 2), suggests something deeper than a mere ratio (see EXCHANGE, VALUE IN).

Mill's threefold classification of valuables (ch. ii. § 2; cp. DIFFICULTY OF ATTAINMENT) has been criticised as omitting the category of things which are produced in greater quantities at a less cost. Moreover the first class "things of which it is physically impossible to increase the quantity beyond certain narrow limits," of which the characteristic is that "the value depends on the demand and the supply," is defined in terms too narrow to include all the objects which possess that attribute, viz. labour and articles of foreign trade (bk. iii. ch. ii. § 5, last par.), and loanable capital (bk. iii. ch. xxiii. § 1).

The general theory of demand and supply seems to be stated by Mill as clearly as is possible without the aid of mathematical apparatus (bk. iii. ch. ii. §§ 3 and 4). Distinct intimations of the phenomenon which would now be described as the greater or less elasticity of the demand curve are to be found (bk. iii. ch. ii. § 4, par. 1; *ibid.* ch. xviii. § 8, referring to "extensibility of demand").

The third and fourth chapters of the third chapter are concerned with "necessary" (ch. iii. § 1) value, that which depends on *cost* of production. The different senses in which Mill uses cost may be distinguished by observing that the term is applied sometimes (1) to the efforts and sacrifices attending production, some-

times (2) to the pecuniary equivalent of the same (the "expenses" of production in Prof. Marshall's phrase); and that the expenditure, whether in the way of labour or of money, may relate either (*a*) to the finished commodity, or (*b*) to the workman's part therein, exclusive of the capitalist's (and entrepreneur's) effort and sacrifice or the (pecuniary remuneration thereof). For instance, 2 (*a*) must be understood when it is said that "Profits as well as wages enter into the cost of production which determines the value of produce" (bk. iii. ch. iv. § 4, par. 1). The following are instances of (*b*): bk. ii. ch. xv. § 7; bk. iii. ch. iii. § 1, par. 1, ch. iv. § 1. In connection with international trade *cost* is used in sense 1 (bk. iii. ch. xviii. § 9).

The theory of value having been summed up (bk. iii. ch. vi.); the second volume enters on the subject of money. The functions of money described by Jevons as a "measure of value" a "medium of exchange" and "a standard for deferred payments," are in other words stated in the first chapter of the second vol. (bk. iii. ch. vii. §§ 1, 2). The relation between demand and supply and cost of production is made particularly clear in the case of money (bk. iii. chs. viii. and ix.). The "quantity-theory" of money and its limits could not be better stated than in the proof which is given of the antithetical statements: "That an increase of the quantity of money raises prices, and a diminution lowers them, is the most elementary proposition in the theory of currency, and without it we should have no key to any of the others" (bk. iii. ch. viii. § 4): "That the value of the circulating medium . . . is in the inverse ratio of the quantity" is to be received with "qualifications which, under a complex system of credit like that existing in England, render the proposition an extremely incorrect expression of the fact" (ch. viii. end). However, objection has justly been taken to the statement that, "the natural and average prices of commodities are not affected by credit" (ch. xii. § 1, par. 1).

The chapters on a "double standard" and "on a measure of value" (chs. x. xv.), may be selected as bearing on questions of great interest at present. In the former, Mill does not consider *international* bi-metallism. In the latter, he seems to contemplate two of the principal methods of measuring a change in the value of money: viz. the labour and the consumption standard (see INDEX NUMBERS). With reference to Mill's disparaging remarks on "the necessary indefiniteness of the idea of general exchange value" (ch. xv. § 1), Prof. Sidgwick has pointed out (*Pol. Econ.*, bk. i. ch. ii. § 3) that Mill himself has employed some such conception in the passage where he maintains that during the last five years of the French war "the value of the standard itself was very considerably raised" (Mill, *Pol. Econ.*, bk. iii. ch. xiii. § 7).

The chapter on "some peculiar cases of value" is of peculiar interest as showing Mill's conception of the relation between "cost of production" and "a law of value anterior to cost of production, and, more fundamental, the law of demand and supply"; which "when cost of production fails to be applicable . . . steps in to supply the vacancy" (bk. iii. ch. xvi. § 1).

The antecedent law of supply again "steps in" in the theory of international values (ch. xviii. § 1). The great chapter on this subject may be divided into two parts, the original draft (§§ 1-5) and the additions suggested by "intelligent criticisms," chiefly Thornton's (§ 6 *et seq.*). The first part deals mainly with two problems (1) the case of a trade being established—a "barrier" (Cournot) being removed—between two countries (§§ 2-3), and (2) the case of an already established trade being facilitated by an improvement in the process of manufacture of an export. In the latter case benefit does not necessarily accrue to the country in which the improvement has taken place (§ 5). In both cases it may be objected that benefit is estimated by an improper measure, that of exchange-value (see *Theory of International Values*, pt. i., by Prof. Edgeworth, *Economic Journal*, vol. iv. pp. 35, 424, 606).

Of the second part of the chapter (§§ 6-9) it is well said by a high authority on international trade: "Nothing is gained by the laborious and confusing discussion" (Bastable, *International Trade*, p. 29). The introduction justifying the addition is particularly objectionable. "It is conceivable that the conditions might be equally satisfied by every numerical rate which could be supposed" (§ 6, last par.). "The equation of international trade" would thus be a very odd sort of equation!

Reinforced by the principles of international trade, Mill returns to the theory of money (chs. xix.-xxii.). He continues the subject of international trade in the chapter on "the competition of different countries in the same market" (criticised in part iii. of Prof. Edgeworth's theory of international trade, *Economic Journal*, vol. iv.).

It is impossible here to notice in detail the many detached topics which are treated in bk. iii. The "rate of interest" (ch. xxiii.) has already been referred to as a case of demand and supply, rather than "necessary" value which depends on cost of production. In the immediately following chapter, by a not very obvious transition, the rival theories respecting the influence of bank issues on prices—the so-called currency theory and banking principle—are discussed with moderation (see Walker, *Money*.—Cp. FULLARTON).

The Dynamics of Political Economy (bk. iv. ch. i. § 1) is the subject of the next book. It is attempted to compound the counteracting

tendencies which we now call the law of decreasing and the law of increasing returns; though Mill will not allow that "even in manufactures increased cheapness follows increased production by anything amounting to a law" (*ibid.* ch. ii. § 2). Considering the three factors of industrial progress, capital, increase of population, and improvements in production, Mill inquires how the increase of one or more of these affects wages, profits, and rent (*ibid.* ch. iii.). For example, one case is: Capital increasing, population and the arts of production stationary. In this case wages will rise, profits will fall, rent will rise if the labourers consume more, or more costly, food (*ibid.* § 2). The case of arts of production progressive, capital and population stationary, presents most difficulty (*ibid.* § 4). *Primâ facie* wages would rise, profits would be unaffected, rent would fall. The Ricardian paradox that landlords may be injured by agricultural improvements is supported by reasoning which, as pointed out by Prof. Marshall (*Principles of Economics*, note to bk. vi. ch. ix.), is deficient in generality. Attention should be called to the generalisation contained in the following passage: "It is quite in accordance with common notions to suppose that if, by the increased productiveness of land less land were required for cultivation, its value, like that of other articles for which the demand had diminished, would fall" (bk. iv. ch. iii. § 4). Here a problem of distribution is treated simply as one of value; and indeed throughout the chapter there is, as Professor Marshall has pointed out (*Principles of Economics*, note to ch. ii. bk. vi.), "scarcely any trace of those confusions in his discussion of the theory of distribution" which disfigure the second book.

The chapters (chs. iv. and v.) on the "tendency of profits to a minimum," are important as bearing on the question: How far is it safe for the working classes to press on the gains of the saving classes (see Cairnes, *Leading Principles*, bk. ii. and cp. Marshall, *Economics of Industry*, 2nd ed. bk. ii.).

The chapter on the stationary state (ch. vi.) is particularly characteristic of the author. Of an increase of population he says, "even if innocuous, I confess I see very little reason for desiring it."

The last chapter of the fourth book "on the probable futurity of the labouring classes," enjoys the distinction of being "entirely due," according to a statement in the *Autobiography*, to Mrs. Mill. Her hand is perhaps to be traced in the delicately ironical description of what may be called the aristocratic theory of the relation between the great and the labouring poor—"a theory also applied to the relation between men and women" (ch. vii. § 1). The principal hope which the Mills hold out for the futurity of the labouring classes is productive co-operation—a hope which does not seem at present in the way of being fulfilled. There are many now who disagree with the favourable estimate of *competition*, which concludes the chapter. "If the slopsellers and others of their class have lowered the wages of tailors, and some other artisans, by making them an affair of competition instead of custom, so much the better in the end."

The fifth book treats of *government;* the functions of which are described with a freedom which might not have been expected from the son of James Mill; "the admitted functions . . . embrace a much wider field than can easily be included within the ring-fence of any restrictive definition." As explained in the first chapter (par. 2, § 3), the "necessary" and acknowledged functions (1) are first considered (chs. ii.-ix.); then (2) "optional" interferences of government (*a*) grounded on erroneous theories (ch. x.); (*b*) really advisable (ch. xi.). Of the chapters relating to the "necessary" functions, five (chs. ii.-vi.) are devoted to taxation. In the chapter on the general principles of taxation, "equality of sacrifice" is assumed as the first principle (ch. ii. § 2). In applying this principle to progressive taxation, Mill employs considerations which would now be connected with the doctrine of "final utility" (ch. ii. § 3, par. 2). (See FINAL DEGREE OF UTILITY.) That doctrine had been asserted by him more explicitly in an earlier passage: "the difference to the happiness of the possessor between a moderate independence and five times as much, is insignificant when weighed against the enjoyment that might be given . . . by some other disposal of the four-fifths" (bk. ii. ch. ii. § 4, last par.). The incidence of various taxes is discussed by Mill with Ricardian rigour (bk. v. chs. iii.-vi.); and other ordinary functions of government are considered as to their economical effects (chs. viii., ix.).

Of "optional" interferences grounded on erroneous theories (ch. x.), protection is first discussed in a splendid and candid section, in the course of which occurs the often quoted passage, in which protecting duties are said to be defensible "on mere principles of political economy, when they are imposed temporarily (especially in a young and rising nation), in hopes of nationalising a foreign industry, in itself perfectly suitable to the circumstances of the country." Another *locus classicus* in this chapter is the section on *combination*.

In the last chapter it is maintained that LAISSEZ-FAIRE is the general rule; but liable to large exceptions. Among these one of the most striking is the admission that upon certain assumptions the legal limitation of the hours of work might be advisable. A still more stringent governmental interference — transcending the proposals even of socialists—is put forward in a former chapter: to restrict the numbers of population by law (bk. ii. ch. xiii. § 2).

It will be understood that what has been attempted here is not to construct a table of contents magnified in a uniform proportion, but to select some leading topics and characteristic passages which may assist the student to comprehend Mill's system.

The *Political Economy* was revised in successive editions, but not much altered. Some of the changes in the second edition (1849) were favourable to socialism, one of the additions to the third edition (1852) is probably not an improvement, namely the sections 6-8 in the chapter on "International Values" (bk. iii. ch. xviii., cp. Bastable, *International Trade*, p. 29).

Some modifications of the doctrines stated in the *Political Economy* are to be found in Mill's later writings. In a review of Thornton in the *Fortnightly Review*, 1869, republished in the *Dissertations and Discussions* (vol. iv.), Mill recants the wage-fund theory. He did not, however, in his latest editions, withdraw the passages in chapter xi. of the second work. He seems to have regarded the correction as "not yet ripe for incorporation in a general treatise on political economy" (preface to eighth edition). In three posthumous articles on socialism published in the *Fortnightly Review*, 1879, Mill perhaps states the case against existing institutions more forcibly than in the *Political Economy*. However, he exposes the exaggerations of socialists with respect to the remuneration of capital and business power. He looks, not for a total renovation of society, but for such a modification of the idea of property as will make the institution work better than at present.

The rest of the acts and writings of J. S. Mill should occupy much space in a complete biography. But for the present purpose they need only be briefly referred so far as they contain applications and completions of his economic doctrines. In his *Liberty*, he continues the discussion of the limits of governmental interference, cp. *Pol. Econ.*, bk. v. In his *Subjection of Women* (1869), he advocates a cause in favour of which he had already stated what may be called the economic arguments (*Pol. Econ.*, bk. ii. ch. xiii. § 2, ch. xiv. § 5). The appropriation by the state of the "unearned increment" of land was agitated by Mill in papers and speeches which are collected in the fourth volume of the *Dissertations and Discussions*. With respect to this proposal it is forcibly urged by Thorold Rogers that "if, more than twenty years ago, Mr. Mill's scheme had passed into the region of practical politics, the purchase [of the land by the state] would have been disastrous . . . to the people of the United Kingdom" (*Economic Interpretation of History*, p. 515). The creation of a peasant proprietary, which Mill had proposed so far back as 1846 in the *Morning Chronicle* (see *Autobiography*, p. 235, and *Pol. Econ.*, appendix to vol. i.) was advocated in his pamphlet on *England and Ireland* (1868). Many of the causes which have been mentioned were promoted by Mill during his parliamentary career (1866-68). Among the measures which he advocated in parliament, the proposal to create a municipal government for the metropolis and to pay off the national debt are also of economic interest.

It would be impossible here to enumerate all the points at which Mill brought economic theory to bear upon practical politics. Like Adam Smith, he "associates the principles with their applications" (preface to first edition of *Pol. Econ.*). He treats political economy "not as a thing by itself, but as a fragment of a greater whole" . . . "for practical purposes inseparably intertwined with many other branches of social philosophy." The breadth of view required for this wider treatment of the science was obtained by his pre-eminence in general philosophy. In this respect also he, and he alone, is comparable to Adam Smith.

Among the circumstances which influenced Mill's intellectual life, must be mentioned his connexion with the India Office; where he was constantly occupied for thirty-five years, down to 1858, when the government of India was transferred to the crown. He himself has attributed a salutary influence to this official work. He has also acknowledged a large debt of inspiration to his wife, formerly Mrs. Taylor, whom he married in 1851. He ascribes to her, not the abstract parts of his political economy, but some of the socialistic elements; in particular, the chapter in the fourth book on the futurity of the labouring classes. Her influence did not cease with her death (1858). "I bought a cottage as close as possible to the place where she is buried, and there her daughter . . . and I live constantly during a great part of the year. My objects in life are solely those which were hers; my pursuits and occupations those in which she shared or sympathised."—*Autobiography*. Thus cherishing her memory as a religion, Mill lived at Avignon up to the year 1873, when he succumbed to a local endemic disease.

[The chief original source of information as to the facts and feelings of Mill's life is his *Autobiography*. It is supplemented by Prof. Bain's *J. S. Mill*. See also *John Stuart Mill*, by W. L. Courtney. Among the few works, or parts of works, which are directed systematically to the criticism of Mill's *Political Economy* may be mentioned: Marshall's *Principles of Econ.* 2nd ed. passages relating to Mill, in particular the note at the end of bk. vi. ch. ii.; also article in *Fortnightly Review*, "On Mr. Mill's Theory of Value," 1876. —E. Cannan's *History of the Theories of Production and Distribution*.—J. Bonar, *Philosophy and Political Economy*, chapter on J. S. Mill.—Nicholson, *Principles of Political Economy*.—F. A. Lange, *Mills Ansichten über die soziale Frage*, etc., Duisburg, 1865.—Prof. J. Laughlin has published an abridged and annotated edition of Mill's *Political Economy*.] F. Y. E.

MILLAR, JOHN (1735-1801), historian, was called to the Scotch bar in 1760, and in the following year accepted the appointment of professor of law in the university of Glasgow, which post he held till his death. His lectures, which were extempore, attracted many students. In politics, Millar was an advanced whig, although opposed to universal suffrage. He strongly sympathised with the American colonists, and regarded the success of Pitt in 1784 as a fatal blow to the English constitution; even the excesses of the French revolution did not cause him to agree with Burke. Millar wrote *An historical view of the English Government, etc.*, London, 1787, 4to, 3rd ed., 1803, 8vo, 4 vols., which was designed as a counterblast to Hume. Only two volumes of the work were published in Millar's lifetime, and the last consists of essays which were intended to be worked up into the narrative. Those on the advances of manufacture and commerce, and the effect of that advance upon the morals of the people, are still of interest. Following Adam SMITH (*q.v.*), Millar recognises that "mercantile people are the best judges of their own interests." Millar's other work, *On the Origin of the distinction of Ranks*, London, 1771, 4to, 4th ed., Edinburgh, 1806, 8vo, containing a study of primitive society, is remarkable for its anticipation of the views of more recent writers. The prescience of his views on gynæcocracy, or that stage of social development wherein, through kinship counting from the mother, the position of woman is most important, is borne witness to by J. F. Maclennan, in his *Studies in Ancient History*, London, 1876, 8vo, p. 420. Millar is still under the sway of 18th century notions, such as that of the "simplicity" of savage races, and he wrote before the dawn, as it were, of the new science of anthropology. That, under these circumstances, he should have accomplished what he did, is much to his credit. It should be added that he was the valued friend of Adam Smith and David Hume.

[Memoir by John Craig prefixed to 1806 ed. of *Origin*, etc. as above. *Dictionary of National Biography*, vol. xxxvii.] H. E. E.

MILLES, THOMAS (between about 1550 and 1630), Customer[1] of Sandwich, was the author, among other works, of the following:

The Customers Replie, or Second Apologie. That is to say, An Aunswer to a confused Treatise of Publicke Commerce, printed and dispersed at Midlebourghe and London, in favour of the private Society of Merchants-Adventurers. By a more serious Discourse of Exchange in Merchandise, and Merchandising Exchange. Written for understanding Readers onely, in favour of all loyall Merchants, and for the advancing of Traffick in England, London, 1604, 4to. A note by the author shows to what decision he had arrived: "That Merchandising Exchange is that Laborinth of Errors & private Practise, whereby (though Kings weare Crownes & seem absolutely to raigne) particuler Bankers, private Societies of Merchants, & covetous persons (whose End is Private gayne) are able to suspend their Counsailes & controle their Pollicies . . . thus making Kings to be Subiects, and Vassalles to be Kings" . . . —therefore it is in the interest of Kings themselves to "relieve & maintaine . . . free-borne Traffick . . . and English Traffick."—*The Customers Apologie, the body whereof is to be read more at large in the Thesaurario Bodleyano Oxonii, and heere only abridged, paraphrased, and fitted into the written Table or Epitome of all his other Workes, touching traffycke and customers*, n.d. or place of publication, with manuscript notes.—*An Abstract, almost verbatim (with some necessarie Additions) of the Customer's Apologie, written eighteen yeares ago, to shew their distresses in the Out-Ports, as well through want of Maintenance and Meanes to beare out their Service; as Countenance and Credit in regard of others.*—A third abridgment, n.d., no title-page.—*The Customers Alphabet and Primer, conteining Their Creede or Beliefe in the true Doctrine of Christian Religion, Their Ten Commandementes*, etc., etc., 1608.—*An Out-Port-Customers Accompt, of all his Receipts*, . . . n.d.

[*Dict. Nat. Biog.*, art. "Milles, Thomas."] E. D.

MILLONES Y CIENTOS, duties levied in Castile on the consumption of meat, oil, wine, vinegar, ice, sugar, dried grapes, and tallow candles; first granted temporarily by the *Cortes*, they came to be continued every six years, and lasted to this century. Their operation was very vexatious and so irregular that, according to a memorial presented in 1646 by Alcazar de Arriaza, a pound of meat, which was sold at that time for 22 *maravedis* in Aranjuez, cost 46 in Ocaña, a few miles off.

[Canga Argüelles, *Diccionario de Hacienda* (London, 1826).—Colmeiro, *Historia de la Economía Política en España*, vol. ii. pp. 542 and 550.] E. Ca.

MILNE, JOSHUA (1776-1851), was appointed actuary to the Sun Life Assurance Society in 1810.

He published, in 1815, *A Treatise on the valuation of Annuities and Assurances on Lives and Survivorships*, London, 1815, 8vo. The Carlisle Table contained in this work, which was founded on the published observations and private correspondence of Dr. HEYSHAM of Carlisle, started a new era in life assurance. Though its results were slightly more favourable, the Carlisle Table does not differ greatly from the English Tables, which are based on the observation of thirty years, and on materials drawn from the whole of England. *The Life of Dr. Heysham*, by Dr. Lonsdale, London, 1870, contains Milne's correspondence on the subject. Milne wrote the articles in the *Encyclopædia Britannica*, 4th ed., on "Annuities," "Bills of Mortality," and "Law of Mortality"; the last of which was reprinted as Appendix G. 3 of *Report*

[1] The receiver of Customs duties. Dowell, *Hist. of Taxation and Taxes in Eng.*, 2nd. ed., vol. i. p. 171.

from the Select Committee of the House of Commons on the Laws respecting Friendly Societies, 1827. He also gave evidence before this committee. He is quoted by Malthus in the latter's art. on Population, *Encyc. Brit.* (1824) see Bonar's *Malthus*, 1885, p. 72.

[*Dictionary of National Biography*, vol. xxxviii. p. 8.] H. E. E.

MILNER, JAMES (d. 1721), merchant of London, contributed articles on trade between England and Portugal to the *British Merchant*, during the controversy on the 8th and 9th clauses of the Treaty of Utrecht (1713), (see KING, CHARLES). He also published *Three Letters to the South Sea Company and the Bank*, etc. London, 1720, 8vo.

[For further notice of Milner's life see *Dictionary of National Biography.*] W. A. S. H.

MILREIS (PORTUGUESE). The money of account in Portugal is the reis. Gold is the standard of value, the milreis, or 1000 reis, being the smallest coin of that metal. The larger gold coins, pieces of 2000, 5000, and 10,000 reis, are proportionate to the milreis in weight, and identical in fineness. The milreis weighs 27·37 grains, is composed of gold of the millesimal fineness of 916⅔, and is equivalent in sterling to 4s. 5⅛d., and in gold francs, 900 fine, to 5·6 francs. F. E. A.

MINE, COST BOOK PRINCIPLE. See COST BOOK.

MINES. Down to the year 1688 all mines in England yielding gold or silver belonged to the crown. It was a common practice for the kings of the 14th and 15th centuries to grant charters to adventurers to enter upon private lands to search for mines. These included lead, tin, and copper mines, each of which contained silver or gold in small quantities, for the doctrine, as affirmed by the court of exchequer chamber in 1568, was that "be the quantity of it ever so small, yet the king shall have the whole of the base metal." The rights of the lords of the soil were so far respected that the mining charters contained clauses forbidding mining under houses or castles, sometimes also under arable lands and meadows, without their licence. A double royalty was imposed, one to be paid to the king, a second, somewhat less in amount, to the landlords. A lease of copper mines by Edward IV. reserves a royalty of one-eighth to the king and one-ninth to the lords of the soil; a lease of lead mines by the same king reserves one-sixteenth to the landlords and one-twelfth to the king. Pursuant to the general commercial and industrial policy of the middle ages, the inhabitants of mining districts in England were incorporated in district bodies invested with exceptional rights. The most notable instance of these corporations is that of the Stannaries or tin mines of Devon and Cornwall (STANNARIES). Analogous powers were given to the mining law court of the foresters of Dean, which passed rules for the working of the mines and provided for the settlement of disputes among those enfranchised of the forest. The lead miners of Derbyshire in the same way enjoyed the right of a great Court Barmoot. In these exceptional districts the crown retains those paramount rights which were once probably universal, and the customs have been defined by modern acts of parliament (14 & 15 Vict. c. 94. High Peak, 15 & 16 Vict. c. 163. Low Peak, 1 Vict. c. 43; 24 & 25 Vict. c. 40; 34 & 35 Vict. c. 85, Forest of Dean, etc.). Miners under royal charters were also commonly free from being impleaded in the king's courts saving for life, limb, or land. They enjoyed the rights of chartered towns, being quit of tolls and tallages.

In 1568 an attempt was made to confine the rights of the crown to mines worked for the precious metals, and to exclude them from those mines in which the precious metals were a secondary incident. But the ancient principle was reaffirmed, three justices dissenting. In 1688 a momentous revolution was effected by parliament. By 1 Will. & M., c. 30, it was enacted that "noe mine of copper, tin, iron, or lead shall hereafter be adjudged, reputed, or taken to be a Royall Mine although gold or silver may be extracted out of the same." By this clause an immense property was transferred from the nation to the landowners. By an act of 1693 (5 Will. & M., c. 6) a modification was introduced in favour of the crown. While the subject may under this act work his base metals at will, the crown has the right of pre-emption of the ore at such prices as would represent its fair value in the absence of royal metals. Those prices were fixed by the act, and having now become obsolete, the crown's rights are not, in fact, exercised. But the royal prerogative, in the case of a mine worked for gold, was affirmed by the court of appeal in 1891 in the case of the Att. Gen. *v.* Morgan. Alum mines were occasionally claimed by the crown, and in the reign of James I. all the judges held that the crown could grant licenses for working saltpetre for gunpowder in any lands of the subject, for the defence of the realm, though the owners of the land were also left at liberty to mine upon their own account.

Owing to the scarcity of the precious metals felt towards the close of the middle ages, constant efforts were made by the English kings themselves to discover them in this country. The science of mining being very imperfect, foreigners were frequently brought in from abroad, as appears from the mining patents granted by Edward IV. and Henry VIII. Wolsey took a particular interest in the development of mining industry. Under Edward VI. endeavours were made to discover and work mines in Ireland, but these proved a failure. Metallurgy was so

little understood that under Mary a commission was appointed to learn the art of refining from a German adventurer. In the time of Elizabeth mining engineers were still largely German. The rights of the crown naturally checked mining enterprise until the act of 1693, from which it received a great impetus.

Coal mining was practised in the north of England and the south of Scotland from very early times, and the leasehold system with royalties was common in the 14th century. A frequent practice with corporations was to limit the quantity of coal to be worked per diem in order, doubtless, to prevent exhaustion of the supply, it being a prevalent opinion that the coal mines could only be worked near the surface. In 1610 Sir George Selby informed parliament that twenty-one years would exhaust those of Newcastle. This stimulated invention for draining mines in order to work the lower levels, from which developed the whole art of modern coal mining.

Until the present century, except in the case of royal mines, there may be said to have existed no general statutory regulations for the working, management, and inspection of mines, nor for the security of those employed. By 5 & 6 Vict. it was forbidden to employ females underground after 1st March 1843. The employment of boys under ten was also forbidden. The inspection of coal mines by government was undertaken in 1850 by 13 & 14 Vict. c. 100, which empowered the appointment of inspectors. Analogous provisions were enacted for metalliferous mines in 1872 (35 & 36 Vict. c. 77). This act raised the age for the employment of boys to twelve, after the example of the Mines' Regulation Act of 1860 (23 & 24 Vict. c. 151). There is a natural parallelism in the legislation affecting the two classes of mines, that for coal mines being distinguished by the special precautions ordered by the legislature with the object of preventing explosions, etc. Common features are the prohibition of the payment of wages in public-houses; notice to inspectors in case of explosions, accidents, and loss of life; rules as to the opening and working of new shafts; and codes of offences in the nature of contravention of the rules for the safe working of the mines approved by the secretary of state. The principal acts now in force are, for the regulation of coal mines that of 1887 (50 & 51 Vict. c. 58), and for the regulation of metalliferous mines that of 1872 (35 & 36 Vict. c. 77).

MINES AND MINERALS, EXHAUSTION OF. While this circumstance sometimes brings about the impoverishment of the district where it occurs, the following causes make it difficult to obtain precise information on the subject—(1) more careful search, better means of communication, and improved methods of working have tended to increase the supply from districts which were becoming exhausted: (2) the general growth of population masks the effects of a local decline, and the latter may be prevented, where mines are failing, by the development of other industries. This sometimes is exemplified in the mines. Dolcoath, by deepening the workings, was transformed from a copper mine to one producing tin. The great open working at Carclaze, though its tin is now almost valueless, is continued for china clay. (3) Mines and quarries in ancient times were frequently worked by slave or convict labour, an example followed more recently by Spain in America and by Russia in Asia. A settlement of this type adds little to the prosperity of the immediate neighbourhood, and the effects of its disappearance are comparatively unimportant. (4) In districts where labour is free, the settlements at first are hardly more than camps; log-huts or shanties being the nearest approach to permanent buildings. In case of a speedy failure, the horde disperses like birds of prey from a consumed carcase, and leaves hardly more trace of its presence. (5) If, however, the undertaking is prosperous, the camp is gradually changed into a city; and the instances of this are at present so young that, as yet, they are in the full tide of success. In these cases the effects of the exhaustion of the mineral wealth of a district are still in the future. The harvest is still being reaped; few fields have yet been absolutely cleared. Instances must mainly be sought in localities comparatively unimportant; but exhaustion is only a question of time, and such investigations as those of Jevons on *The Coal Question*[1] remind the economist of the necessary limitations of the nature of this part of our wealth.

Precious Metals.—Much might be said as to the effects produced on the more civilised part of the world by the arrest—from the decline of Rome till about the 9th century—of any serious efforts to obtain fresh supplies of gold

[1] "A little reflection will show that coal is almost the sole necessary basis of our material power . . . England's manufacturing and commercial greatness, at least, is at stake in this question, nor can we be sure that material decay may not involve us in moral and intellectual retrogression."—Jevons, *Coal Question*, Introd.

and silver,—commodities liable to considerable waste from wear and the purposes to which they are applied; but this is beside the question now considered. Moreover, if a want once seemed likely to occur, owing to the exhaustion of Spain and other *el dorados* of the old world, it has been more than remedied since the discovery of America by the constant opening up of new fields in that and other parts of the globe.

In remote parts of Egypt and the regions about the eastern Mediterranean, places may be found, now deserted, in which formerly the search for gold was actively prosecuted, but no instance is more striking than that of the *Ruined Cities of Mashonaland*, described by Mr. Bent. Here, at various localities between the Zambesi and the Limpopo, often almost buried by vegetation, ruins are found of fortified towns, the walls of which, built of granite blocks, are sometimes 12 to 15 feet thick. Their inhabitants evidently had settled among an unfriendly people to work the district for its gold—they disappeared perhaps as late as the 9th century, and a higher was replaced by a lower type of civilisation, if that term is applicable to the natives of Mashonaland. Again, for a time at least, Mexico supplied an object-lesson in the same kind. Here, during the civil wars from 1810 to 1824, many important silver mines were abandoned, the population dwindled, that of Potosi falling at this period from 130,000 to 9000, and the indirect loss even to agriculturalists was very great. Similar effects have been noted in Columbia, Chili, and Peru from like causes. The Laurium mines, till lately, afforded another example; worked in classic times they were afterwards abandoned, and ruins marked the sites of places once flourishing. Since 1870 they have been re-opened, and even the old slags are being smelted over again. America and Australia have afforded instances of the mushroom growth of settlements, followed by no less rapid desertion. In 1857 there was a rush to the Frazer river (Columbia), followed in 1863 by an exodus of from 15,000 to 20,000 people to Nevada.

Other Metals.—Copper mines were worked in the Sinaitic peninsula about Sarabit-el-Khadim by the ancient Egyptians, where ruins and tablets indicate the presence of a considerable colony; now the region is deserted. Many ruined buildings in Cornwall mark the sites of mines, especially of tin, exhausted or disused.

The following tabular statement, drawn up from the census reports of 1881 and 1891, will show how seriously the population of some of the parishes in the mining districts of Cornwall has been affected, the decline in one case amounting roughly to 25 per cent; the larger towns, as might be expected, having suffered least. In 1901 there was no great alteration owing to the growth of other industries.

Parish.	1881.	1891.
Breage	3017	2751
Callington	1925	1888
Helston	3432	3198
Kea	2470	2103
Liskeard	4053	3984
St. Agnes	4630	4249
St. Cleer	2865	2124
St. Ives	6445	6094
St. Just	6409	6119
Wendron	4584	4250

The same may be said of other spots in Derbyshire, Devonshire, Wales, etc., though the population as a whole has increased.

The Weald of Sussex was once the seat of important iron-works; the last furnace, at Ashburnham, was extinguished in 1828 (Woodward, *Geology of England and Wales*, pp. 357, 361). The woods often conceal abandoned mines and heaps of slag.

Coal, petroleum, etc.—In Britain the mines of coal, often with associated ironstone, in parts of Staffordshire and Shropshire are beginning to show signs of exhaustion, with the same result. But these industries are so modern, comparatively speaking, that probably almost a century must elapse before marked effects are produced. In various parts of the United States, particular localities have become thronged and prosperous by the discovery of mineral oil, and have been deserted owing to its unexpected exhaustion, but the causes already named have restricted the area affected and prevented any remarkable consequences.

Ornamental minerals and rocks.—The turquoise mines of Sinai, like those of copper, were once busy and are now deserted. In the days of the Pharaohs and under the dominion of Rome, the quarries of Egypt were in full activity. Those for granite and the neighbouring ruins near the first cataract have been often described. Yet more striking are those at Jebel Dokhan, from which the red porphyry, so largely exported to Italy, was obtained. These lie at a height of 3650 feet above high water mark, nearly 100 miles from the Nile and on the eastern side of the watershed between it and the Red Sea. The remains of several Roman stations are passed on the route from Kuneh. From the chief quarry a road "led down to an ancient town with workshops." Hence a path went to an old town in the valley, and beyond are the ruins of a Roman temple. In fact deserted quarries are not rare in the mountainous country between the Nile and the Red Sea (*Brit. Assoc. Rep.*, 1887, p. 802). From Algeria and Tunis marbles were exported in large quantities by the Romans; the quarries were deserted, the district was sparsely inhabited, till a few years since, when some of them were again opened (*Brit. Assoc. Rep.*, 1885, p. 1028). The white marble of Thasos was in great request in the age of Hadrian, and

was worked at much earlier dates. The remains of a quay constructed round the headland, the tombs and other ruins of a town and two villages at least, "all in former days thriving on the quarrying and export of marble," indicate the "former position of a commercial centre, dating for centuries before the Christian era, and leaving traces of having continued in prosperity down well into the period of the eastern empire" (*Brit. Assoc. Rep.*, 1887, p. 200). We cannot, owing to the circumstances already mentioned, point to any striking instance of a country ruined by the exhaustion of its mineral wealth, but notwithstanding this the lesson is plain. The mineral store of each district and of the whole earth is practically limited in quantity, be it gold, or any other metal, be it coal or any fuel. The formation of a fresh supply is a process so slow that, for all practical purposes, it may be excluded from consideration. The waste also of the precious minerals is considerable; the wear and tear of the more homely is large; the destruction of combustibles is complete. Hence the store, sooner or later, must be exhausted, now in this country, now in that. In agriculture, provided manures can be obtained, the land seems never to lose its productive power; the mine or quarry, once worked out, has played its part for good in the economy of the earth, and the ill which it has done "lives after it." Metallurgical processes are attended with drawbacks even at the time, but though, when the minerals are no longer obtained, noxious fumes are no more emitted to devastate the neighbourhood, the waste heaps of rubbish or slag still remain, whereon no useful herb can grow and only a forest can spring up after long years. In some districts also the general ruin of the surface, the choked beds of rivers, and large tracts of fertile meadows buried beneath barren gravels, are the heritage bequeathed by the miner. The decline and fall of the nation whose prosperity has depended solely on its mineral wealth, will be not less appalling than that of imperial Rome. T. G. B.

MINING ROYALTIES. See ROYALTIES.

MINGHETTI, MARCO (1818-1886). A statistician and political economist born at Bologna. In 1848, when Pope Pius IX. appeared to espouse Italian nationality, Minghetti became a member of the pontifical council of state, and minister in the first liberal secular ministry of Pius IX. But when the pope set himself against the war of independence, Minghetti resigned office and joined the camp of Charles Albert. He fought at Custozza and Goito, and later on was a colleague of Count Cavour at the Paris congress of 1857. He then became, under Cavour, general secretary of foreign affairs, secretary of the interior in 1859, minister of the interior in 1860, and ambassador. After having greatly assisted in the formation of united Italy, he became president of the council of the kingdom in 1863, and again from 1873 to 1876. An able financier, he applied himself primarily during his ministry to restore Italian finance, and when he left office the budget was balanced.

Minghetti was an eloquent and incisive speaker, a man of the broadest culture, a man of letters, and an historian. He is well known by economists for several works, but chiefly for his book on the relation between economics, ethics, and justice. In this work, ably and clearly written, moderate in opinion, and giving evidence of sound culture, Minghetti based economic science on ethics and law, anticipating, to a certain extent, the modifications which were afterwards applied to the English classical school—placing himself on an intermediate ground between this school and the new theories, principally developed in Germany. While too moderate a man to ally himself with the "socialists of the chair," Minghetti attaches more importance to the phenomena of the distribution of wealth than to those of production, and this basis of his eventually formed one of the canons of the new doctrines. This order of ideas inspired various social laws of which he became a promoter, for example, the law on children's labour, on emigration, on pensions, etc.

Originality and depth of research are perhaps wanting in the writings of Minghetti on economics, but on subjects more his own he was one of the most far-seeing and deep thinkers, and one of the purest and most elegant writers of modern Italy.

MINIMUM (Rate of Discount). The rate known as the "bank rate" is settled every Thursday at the weekly meeting of the bank directors, and published when the meeting is over. It was formerly the minimum rate current not only in the bank discount office, but in the market generally. This lasted as long as the resources of the Bank of England formed the greater part of the capital in the money market, or even later, whilst the bank remained the largest single influence therein. But now, although the deposits of the bank have increased, those in the hands of the other banks have grown in far greater proportion, and the competitive effect of this outside capital is increased by the fact that it is mostly in the hands of a small group of large and powerful banks, instead of being wielded by a large number of banks each individually small. The result of this change has been to bring the rate of discount in the open market, for long periods together, often much below the bank rate; the

bank directors being supposed, in fixing their rate, to have regard not only to the amount of capital they have to employ, but also to the state of the circulation and the condition of the foreign exchanges. On the other hand, it has been strenuously contended by the late Mr. Thomson Hankey, and some other prominent directors of the bank, that the bank's policy should be governed by the ordinary considerations relating to their banking business only.

As a fact the directors have never reduced the official rate below 2 per cent, notwithstanding that in recent years the open market has frequently stood for months together at, or about, 1 per cent. It is understood that the bank minimum now only regulates its relations with the outside market, and that its own customers obtain accommodation at the rates charged by other banks. The bank rate still governs, at a distance, rates charged or allowed in some cases upon advances or deposits. R. W. B.

MINIMUM OF SUBSISTENCE, THE. The doctrine that the labourer cannot permanently earn more than the minimum of subsistence, that is, enough to keep him and his wife and children alive, has often been ascribed to political economists as a body. It has been used to prove at one time the inutility of any attempt to raise wages, and at another time the injustice of the existing order of society. This doctrine, however, has not been universally taught by political economists, and is not borne out by facts. It is connected with the doctrine of the wage fund, and the mode in which it has grown up will best appear from a brief survey of the course of speculation on the subject of wages.

For this purpose we need not go back further than the French *Économistes* of the last century. TURGOT (*e.g.*) declared that the labourer could not in the long run gain more than a bare subsistence, probably basing this assertion on the experience of his own time and country. The bulk of the labouring population of France had been reduced by fiscal and social abuses to a bare subsistence—sometimes even to less, seeing that many died of hunger in bad seasons. In Great Britain at the same time the condition of the labouring class was incomparably better. We find accordingly that Adam Smith does not agree with Turgot on this point (cp. Rae, *Life of Adam Smith*, pp. 220-222). "There are certain circumstances," he writes, "which sometimes give the labourers an advantage, and enable them to raise their wages considerably above this rate," namely, "the lowest which is consistent with common humanity" (*Wealth of Nations*, bk. i. ch. viii.). He then proceeds to inquire what circumstances have this beneficial effect. He concludes that "the liberal reward of labour, as it is the necessary effect, so it is the natural symptom of increasing national wealth. The scanty maintenance of the labouring poor, on the other hand, is the natural symptom that things are at a stand, and their starving condition that they are going fast backwards" (*ib.*).

The next economists to be considered with reference to the minimum of subsistence are MALTHUS and RICARDO. "Malthus," Dr. Bonar says, "without knowing it, was certainly the father of the theory of a wages fund" (Bonar, *Malthus and his Work*, ed. 1885, p. 270). He was deeply impressed with the poverty resulting from an unlimited increase of population, and he seems to have thought that only prudential self-restraint could raise the labourer's income above the minimum that could keep him alive. Ricardo expressed himself on this subject in a way which seems at first sight to coincide with Turgot's assertion. "The natural price of labour is that price which is necessary to enable the labourers one with another to subsist and to perpetuate their race without either increase or diminution" (Ricardo, *Principles of Political Economy*, ch. v.). But he qualifies this proposition by others which have been too commonly disregarded. "It is not to be understood that the natural price of labour estimated even in food and necessaries is absolutely fixed and constant. It varies at different times in the same country and very materially differs in different countries. It essentially depends on the habits and customs of the people." He adds—"The friends of humanity cannot but wish that in all countries the labouring classes should have a taste for comforts and enjoyments, and that they should be stimulated by all legal means in their exertions to procure them." Ricardo thought that real wages might increase with the increase of capital, but he thought that after the period at which all fertile land had been taken up, real wages would tend to fall. Thenceforward rent would grow at the expense of wages and of profits. Some of his expressions would suggest also that the only way in which the labourers could permanently improve their condition was by restricting their number. Whoever may have originated the doctrine of the wages fund, J. S. MILL was the first to formulate it clearly and precisely. From his conception of the WAGES FUND it followed that the labourers' wages must sink to the minimum of subsistence unless the number of labourers were severely kept down. Mill therefore denounced large families with extraordinary violence. Although he afterwards admitted the incorrectness of his views respecting the wages fund, he never completely recast his theory of wages. LASSALLE and later socialist writers eagerly adopted the conceptions of a fixed wages fund and a minimum of subsistence for the labourer as helpful in proving that under the existing order of society the labourer

must always be miserable, and that therefore the existing order of society is inhuman. For similar reasons these conceptions have been employed by Mr. George and by others who wish to abolish private property in land. But, since Mill and Lassalle wrote, the whole subject of wages has been reconsidered in the light of experience, and the doctrine of the minimum of subsistence has been seriously shaken. It has been found that countries in which wages are high can compete successfully with countries in which wages are low, and that real wages may be raised without labour becoming really more costly. The explanation of those facts is twofold. In the first place the wages which just keep a man alive are not enough to keep him efficient. It is a true economy to pay the labourer such wages as will maintain him in full vigour of mind and body. In the second place ill-paid labour is wasteful and dear; it is labour uneconomical to employ. Every rise of wages stimulates the employer to improve his methods of organisation and his mechanical contrivances. Thus it is that within certain limits to be determined only by experience the rise of wages does not necessarily involve loss to the employer. If therefore the labourers are organised, they can apply pressure sufficient to keep wages much above the minimum of subsistence. Natural wages, if so objectionable a term is still to be used, should denote those wages which are really—not apparently—the most economical to pay.

Again the old theory of the wages fund must be modified. General Walker repudiates the wages-fund theory altogether. He holds that wages are paid out of the product of labour, and can be increased indefinitely so long as that product continues to increase (Walker, *Political Economy*, pt. v. ch. vi.). Another American economist, Mr. Gunton, goes further and says that wages are determined by the cost of production of labour, in other words, by the standard of living among the labourers. There is not space here to examine these recent theories. But the doctrine that the remuneration of the labourer tends to dwindle to the minimum on which he can support life may be considered obsolete.

MINIMUM WAGE. See LIVING WAGE.

MINORAT is nowadays an institution peculiar to Germany and German Austria, according to which *Bauerngüter*, which may be defined as entailed peasant holdings, are inherited by the youngest male heir in the nearest degree of relationship; in former times it existed in French Brittany under the name of *Droit du Juveigneur*[1] (see BOROUGH ENGLISH). In contradistinction, entailed estates belonging to noble families descend, in Germany, by MAJORAT (*q.v.*), and even for *Bauerngüter*, the rule of *minorat* is far from being universally followed. Where it prevails it is considered that at the time of his father's death, the eldest children will probably be able to provide for themselves and be independent. But, under other aspects, *minorat* is subject to adverse criticism: there is often a long uncertainty before it is known who will be the heir of the holding, and the latter frequently is only placed in the way of being productive after the actual owner is already incapacitated by old age. Moreover, another unfavourable circumstance is that the heir is too often still a minor when the holding descends to him.

[Holtzendorff, *Rechtslexicon*, ii. 128; and Roscher, *Nationalökonomik des Ackerbaues*, § 92, pp. 328-333, ed. 1888.] E. Ca.

MINT (Latin *Moneta*, a name of Juno, in whose temple money was coined in Rome, hence mint, coined money, Anglo-Saxon *mynet*). As the right to issue coin belongs, in modern societies, exclusively to the sovereign power (Hale, Coke, Blackstone), it follows that a Mint cannot legally issue the coins of the country in which it is situated except under the directions of the sovereign or other central authority. In Anglo-Saxon times a large number of mints were established throughout this country under the control of MONEYERS,—officials responsible for the integrity of the coinage. Since the Norman conquest it appears to have been a common practice, even as recently as the 17th century, to establish a temporary Mint where the sovereign happened to reside, and it was not till after the great recoinage of silver at the end of that century (see under Sir Isaac NEWTON) that all coinage operations were concentrated, so far as England and Ireland are concerned, in the Tower of London. The Dublin Mint was closed in 1696. The Edinburgh Mint, first erected in 1574, was not finally abolished until 1815.

Early in the present century, in 1811, the Mint was removed from the inconvenient premises which it occupied in the Tower to the present site on Tower Hill, and in 1850 the complete control of all its operations passed into the hands of the government.

The primary duty of a Mint, namely the conversion of bullion into coin, naturally entails other duties connected with the precious metals.

[1] From *juvenior*, taken as comparative of *juvenis*.

Thus the hall-marking of plate, and the refining, melting, and casting of gold and silver into commercial bars, are undertaken by certain foreign Mints, but in this country the work of the Department may be grouped under the four following heads:

1. *The coinage of gold presented by private holders for that purpose.*

Under § 8 of the Coinage Act 1870 (33 Vict. c. 10), "any person" is entitled to bring gold bullion to the Mint and, subject to certain specified stipulations, "such bullion shall be assayed and coined, and delivered out to such person without any charge for such assay or coinage, or for waste in coinage" (see FREE COINAGE). Any alloying metal required is also supplied without charge, and a provision of the Coinage Act 1816 (56 Geo. III. c. 68), is re-enacted to the effect that out of every twenty troy pounds weight of standard gold bullion there shall be produced 934 sovereigns and one half-sovereign. This corresponds to the troy ounce being valued at £3 : 17 : 10½ (see GUINEA, INTROD. AND RATING OF). Since the Bank Charter Act 1844 (7 & 8 Vict. c. 32), all persons are, under § 4, "entitled to demand, from the Issue Department of the Bank of England, notes in exchange for gold bullion at the rate of £3 : 17 : 9 per ounce of standard gold," subject to the metal being melted and assayed by persons approved by the bank at the expense of the owner. It will thus be seen that there is a difference of only 1½d. per ounce in the two rates, and experience has shown that the delay necessary for coinage operations leads holders of bullion to take advantage of the Bank Charter Act, and obtain payment at once rather than incur this delay. Thus it happens that, as concerns the gold currency, the Mint in this country deals exclusively with the Bank of England; it should be added that coins which are no longer legal tender, in consequence of their having been reduced in weight by wear below their least current weight, are received for recoinage through the same channel.

2. *The coinage and issue of token silver and bronze pieces as they are required, from bullion purchased on account of the Government.*

The arrangements in force for the issue and maintenance of subsidiary coins are essentially different in character, primarily in consequence of the fact that, whereas these are merely tokens and, therefore, only legal tender to a limited extent, gold coins are intrinsically worth their face-value and of unlimited legal tender.

In connection with the silver currency, however, it is interesting to note that § 9 of the Coinage Act 1816 directed that from a date to be fixed by royal proclamation "any person or persons, native or foreigner," might bring silver coin, plate, or bullion to be converted into coin at the rate of sixty-six shillings per troy pound, sixty-two shillings being returned to the importer and four retained by the Mint to meet the cost of assaying, loss, and coinage. No such proclamation was ever issued, and this section remained a dead letter therefore until the Act was repealed in 1870. Under the provisions of the Act passed in that year, whenever token coins are required to be struck, the requisite silver and bronze bullion is purchased in the market with sums advanced for the purpose out of the Consolidated Fund, and, on issuing this coin at its full nominal value, the Master of the Mint pays the proceeds into the exchequer under two heads:—(*a*) Repayments of advances for the purchase of bullion; and (*b*) SEIGNORAGE (*q.v.*), or, as now defined in practice, the excess of the circulating value of the coin above the purchase price of the metal used in its manufacture.

Worn silver coin is received by the Mint at its nominal value, and all expenses connected with the supply of Imperial token coins to Colonies, and their renewal, are also borne by the Department.

3. *Execution of coinages required by British Colonies and Dependencies.*

Subject to the requirements of the Imperial currency being met, the Royal Mint undertakes the execution of any coinages required by Colonies at fixed charges which are calculated to cover the actual cost of the work performed. The requisite bullion having been delivered at the Mint by the colonial agent, is converted into coin and shipped to the colony at the expense of that colony, all profit in respect of seignorage of course falling into the colonial exchequer. If from any cause the Department is not in a position to undertake such a coinage, the work is usually performed, under government control, by a private firm in Birmingham.

4. *Manufacture of naval, military, and other medals, and miscellaneous duties.*

The manufacture of medals forms an important subsidiary branch of the work of most Mints. In this country they are struck on behalf of the several departments—the War Office, Admiralty, and India Office, as well as for the Royal and several other learned societies. No special reference is here necessary, however, to this branch of work, or to the miscellaneous other duties performed by the Mint, such as the verification of the standard of plate hall-marked at certain assay offices, independent examination of coin issued from Indian, Australian, and, occasionally, certain foreign Mints, etc.

Some allusion should be made to the branch Mints established at Sydney, Melbourne, and Perth by orders in council passed in 1853, 1869, and 1898. Immediately after the early discoveries of gold in Australia, the question of establishing local Mints for coining the precious metal, and thus facilitating its use in commerce, was raised in several of the colonies. New South Wales was the first to obtain the

necessary authority, and, although the question of establishing another branch in Victoria was frequently raised, it was not actually opened until 1872. When first issued the Sydney coins were not intended to circulate in the United Kingdom, but application was soon made by the colony for this concession to be granted, and in 1862 the question was considered by a select committee of the House of Commons. As a result of this committee's report, acts were passed in 1863 and 1866, under which Royal Proclamations were issued in the latter year declaring Sydney coins to be legal tender in the United Kingdom and in specified colonies. Similarly the coins to be struck at Melbourne were legalised in 1869. Since 1871 the coins of both Mints have been identical in design with those of the Royal Mint in London, distinguished only by the mint-marks S, M, and P respectively. The current expenses of the branch Mints are met out of permanent annual appropriations made by the local legislatures, £15,000 at Sydney, £20,000 at Melbourne, £20,000 at Perth, all revenue being paid into the local treasuries. Unlike the Royal Mint, they impose a coinage charge which amounted to 1 per cent, or nearly 9½d. per standard ounce, in 1855, but has for many years been reduced to 1½d. The published returns show that the present rates do not cover the expenses. No token coins are struck, the issue of silver and bronze being confined to the English Mint. The recent gold discoveries in Canada have lately (1904) suggested establishing a branch of the Royal Mint at Ottawa. The gold coin struck there should follow the sovereign form.

[Ruding's *Annals of the Coinage.*—*Encyclopædia Britannica*, 9th edition, article "Mint."—For early English mints see "The English Currency under Edward I.," by C. G. Crump and A. Hughes (*Economic Journal*, vol. v., 1895).—Chalmers's *Currency in the British Colonies.*—Annual Reports of the Deputy-Master of the Mint.—Annual Reports of the Director of the United States Mint.—*Report of Select Committee on the Royal Mint*, 1837 (R. 465).—*Report of Commission on the Royal Mint*, 1849 (c. 1026).—*Report of the Royal Commission on International Coinage*, 1868 (R. 4073).] E. R.

MINT, UNITED STATES. The mint of the United States was established, under the act of 2nd April 1792, in Philadelphia. In 1873 its administration was made a bureau of the treasury department under a director. In 1835 branch mints were established at Charlotte, N.C., at Dahlonega, Ga., and New Orleans; in 1852 at San Francisco; in 1862 at Denver; in 1863 at Carson, Nev. Coinage, however, has been suspended at Denver, Charlotte, and Carson. According to the act of establishment, the unit of account was the DOLLAR divided into tenths or DIMES, hundredths or CENTS, and thousands or MILS. FOREIGN gold and silver coins passed current at certain established rates, until by act of 21st February 1857 they ceased to be legal tender. By the act of 1792 a gold dollar (see DOLLAR, UNITED STATES) was to contain 24·75 grains of pure gold, and the silver dollar (see DOLLAR, UNITED STATES) 371·25 grains of pure silver, the relative value of the two metals being 15 to 1. There was free coinage of both metals, and no charge save that in case of immediate payment in coin, a deduction of one-half per cent from the weight of the pure gold or silver was made. The gold coins authorised were the EAGLE $10 (=£2:1:1), the half eagle, and the quarter eagle. The fineness was 916⅔ parts gold per 1000 (11/12th fine). The silver coins authorised were the dollar, 416 grains in weight, the half dollar, quarter dime, and half dime—all being proportional parts of the dollar in weight, and in fineness 892·43 parts in the 1000. There was no change in the weight or fineness until, by the act of 28th June 1834, the relative value was changed to 1:16·002 by reducing the amount of pure gold in the dollar to 23·20 grains, and increasing the fineness of the coins to 0·899225. The act of 1837 raised the fineness to 0·900, the pure gold in the dollar to 23·22 grains, and changed the ratio to 1:15·988.

In 1837 the weight of the silver dollar was fixed at 412½ grains. The fineness of silver coins was also fixed at ·900. The next important change was by the act of 21st February 1853, when free coinage of silver pieces of less than one dollar in value were closed, the fractional parts of the dollar made subsidiary, and the weights reduced, the half dollar weighing 192 grains. The coinage of the double eagle $20 (£4 : 2 : 2½), and the one dollar, gold, was authorised 3rd March 1849, and the three dollar, gold, 21st February 1853. The coinage of the two latter was discontinued in 1890. In 1902 the gold Louisiana Exposition Dollar was struck. The coinage of a three cent piece was also provided for by act of 3rd March 1851. By act of 12th February 1873 the coinage of the silver dollar, half dime, and three cent piece was discontinued, and the weight of the subsidiary coin slightly raised, that of the half dollar to 192·9 grains.

The act of 28th February 1878 (BLAND ACT) restored the coinage of the standard silver dollar, though not free, and provided for the purchase at the market price by the government of silver bullion at from $2,000,000 (say £400,000) to $4,000,000 (say £800,000) per month, and its coinage. This policy was again changed by the act of 14th July 1890, which authorised the monthly purchase of 4,500,000 ounces of silver, or so much thereof as might be offered at the market price, not exceeding $1·00 for 371¼ grains of pure silver, and the issue in payment of treasury notes redeemable on demand in coin. It was also provided that so much silver should

be coined as might be necessary to redeem the treasury notes issued in payment for the silver. In accordance with this a limited amount was coined until 1893, when the act of 1st November repealed the purchasing clause. The gold standard was adopted in 1900.

By the act of 12th February 1873, individuals had the right to deposit silver bullion for coinage into trade dollars (see DOLLAR, TRADE); this was discontinued 3rd March 1887. For a brief period a twenty cent silver piece was struck; in 1892, 5,000,000 silver half dollars, known as Columbian half dollars, were struck, and also 40,000 quarters; and in 1899, 50,000 Lafayette souvenir dollars.

By the act of 2nd April 1792 the coinage of a copper one cent and a half cent, of 264 and 132 grains respectively, was authorised. The weight of the cent was afterwards reduced to 208, and then to 168 grains. Copper coinage was discontinued in 1857, and in its place was minted a nickel one cent coin, 72 grains in weight, and consisting of 88 per cent copper and 12 per cent nickel. A further change in this coin was made, 22nd April 1864, by reducing the weight to 48 grains, and changing the composition to 95 per cent copper and 5 per cent tin and zinc. A two cent piece was also authorised, discontinued in 1873. Between 1865 and 1890 a three cent piece was authorised; and 16th March 1866 a five cent coin, popularly known as a nickel, 75 per cent copper and 25 per cent nickel, was authorised.

The total coinage of all the mints until 30th June 1904 has been as follows:—

Gold.		
Double eagles, 1850-1904	$1,850,281,960	£370,056,392
Eagles, 1793-1804, 1838-1904	378,877,070	75,775,414
Half eagles, 1793-1904	301,683,260	60,336,652
Three dollars, 1854-89	1,619,370	323,875
Quarter eagles, 1796-1808; 1821-1904	30,263,555	6,052,711
Dollars, 1849-89	19,749,595	3,949,919
Silver.		
Trade dollars, 1873-87	35,965,924	7,193,185
Dollars, 1793-1805; 1836-73; 1878-1904	578,353,564	115,670,713
Half dollars, 1793-1904	161,756,359	32,351,272
Quarter dollars, 1793-1904	77,170,693	15,434,138
Twenty cents, 1875-78	271,000	54,200
Dimes, 1793-1904	45,690,598	9,138,120
Half dimes, 1793-1805; 1829-73	4,880,219	976,044
Three cents, 1851-1873	1,282,087	256,417
Minor Coinage.		
Five cents, 1866-1904	23,583,145	4,716,629
Three cents, 1865-90	941,349	188,270
Two cents, 1864-73	912,020	182,404
Cents, 1793-1904	16,714,153	3,342,831
Half cents, 1793-1904	39,926	7,985
Total—Gold	$2,582,474,816	£516,494,963
Silver	905,370,444	181,074,089
Minor	42,190,593	8,438,119
Grand Total	$3,530,035,853	£706,007,171

As indicated by foregoing statements, there has been a large seignorage on silver coinage, and up to 1904 there had been paid into the treasury of the United States on this account $133,026,322 (£26,605,264).

From the standpoint of administrative finance, the bureau of the mint is an important office. In the fiscal year ending 30th June 1904 the expenditures were $1,729,812 (£345,962), of which $198,476 (£39,695) was for salaries and $1,069,555 (£213,911) for wages. The income was $6,910,246 (£1,382,049), of which $215,184 (£43,037) were from charges for parting and refining bullion, and the larger part of the remainder from seignorage. In 1873 the charge for making gold coins was reduced to one-fifth of one per cent, and in 1875 entirely abolished, save that the depositor pays for the copper used in alloying the gold.

The legal limit of tolerance in fineness of gold coins is 0·001, and of silver coins 0·003. Each year there is an annual trial of coins by an independent commission appointed by the president.

[See the *Annual Reports of the Director of the Mint*, especially the *Twenty-first*, for 1893, pp. 83-94. See also H. R. Linderman, *Money and Legal Tender*, New York, 1879.—W. A. Shaw, *The History of Currency*, pp. 246-266.]

D. R. D.

MINT PAR OF EXCHANGE. The equivalent, in terms of one coinage, of the quantity of pure metal contained in another standard coin, both being of the same metal, and taken at mintage weights. The sovereign contains 113·001597 grains or 7·322379 grammes of fine gold, and the following are its equivalents in the coins of other gold-standard countries. The value in pence of the unit of each country is also given:—

		£1=		
France, and Latin Union	fcs.	25·221	franc	= 9·515d.
Denmark and Scandinavian Union	kr.	18·159	krone	=13·216d.
Germany	mks.	20·429	mark	=11·754d.
Holland	fl.	12·107	florin	=19·823d.
Austria	kr.	24·017	krone	= 9·992d.
Portugal	mil.	4·504	milreis	=53·284d.
Brazil	mil.	8·912	milreis	=26·929d.
United States	$	4·867	dollar	=49·316d.
Argentina	$	5·044	peso	=47·578d.
Uruguay	$	4·707	peso	=50·988d.
Chili	$	13·346	peso	=17·995d.
Russia	rb.	9·40	rouble	=25·369d.
Japan	yen	9·765	yen	=24·577d.

The par given above for France serves also for the other countries of the Latin Union—Belgium, Switzerland, Italy, and Greece; francs being altered for Italy into *lire*, and for Greece into *drachmas*. It serves also for Spain with francs altered into *pesetas*, though quotations are usually made in pence per dollar, or piastre, of five pesetas. The par given for Denmark serves also for Sweden and Norway.

Mint pars are given above for Portugal, Brazil, Argentina, and Chili, although at present (1906) their actual exchanges are in terms of more or less inconvertible paper money.

R. W. B.

MINT PRICE OF BULLION. With free and open mints that which is frequently called the mint price is the equivalent in terms of coin. By the Coinage Act (33 Vict. c. 10, § 8), any person may bring gold bullion to the mint, and receive the same again, assayed and coined, without charge, provided the bullion be of such character as not to require refining. The sovereign weighs 123·27447 grains of standard gold, *i.e.* $\frac{11}{12}$ fine, and, therefore, for every ounce of gold bullion of equal fineness that is brought in, the importer will receive back in coin, $£\frac{480}{123\cdot27447} = 3\cdot89375$ or £3 : 17 : 10½. The importer will of course have to wait his turn, and also whilst his parcel of gold is being coined; and, in order to avoid this, one of the conditions imposed in the charter of the Bank of England is that it shall always purchase bar gold, by payment in its own notes, at the rate of £3 : 17 : 9 per oz. standard. The difference is about equal to twenty days' interest at 3 per cent.

Where a charge is made for coinage, it may perhaps be said that there is a mint price. The following are the coinage terms in some principal countries with open mints :—

GOLD.

Great Britain .	no charge.
United States .	no charge.
France . .	about ¼ per cent.
Germany .	about ½ per cent.
Holland . .	from $\frac{3}{10}$ to $\frac{4}{10}$ of 1 per cent.

SILVER.

British India .	$2\frac{1}{10}$ per cent.[1]
Mexico . .	$4\frac{3}{4}$ per cent.

Where the mint is closed against either metal and purchases are made for coinage on government account, the mint price is necessarily the same as the market price. R. W. B.

MINTAGE, FREE. The power of free mintage of gold was granted to any one who brought standard gold and silver to the English mint by the act of 1666 (18 Chas. II. c. 5), which, commencing with the statement "whereas it is obvious that the plenty of current coins of gold and silver of this kingdom is of great advantage to trade and commerce," in order to encourage this "plenty," enacted that "plate or bullion of gold or silver should be assayed, melted down, and coined with all convenient speed, without any defalcation, diminution, or charge for assaying, coinage, or waste in bullion." This act, as will be perceived, established free mintage for both gold and silver in this country. With respect to silver, the act of 1798-1799 (38 Geo. III. c. 59), prohibited further silver coinage, and the statute of 1816 (56 Geo. III. c. 68), which established the coinage of silver money on its present basis, practically restricted free coinage to gold bullion only. This act was repealed, but was re-enacted in substance by the coinage act of 1870. The gold bullion coined in England is practically all received through the Bank of England, which makes a charge of 1½d. per ounce for delivering gold coin without delay in exchange for the bullion. Similar enactments, with slightly different rates of charges, are in force in France, Germany, the United States, and the other principal countries of the world.

[1] Closed since June 1893.

[*Report of International Monetary Conference.* Paris, 1878, with Appendix by Mr. Dana Horton. —W. A. Shaw, *The History of the Currency, 1252 to 1894.*]

MIR is the modern survival of the ancient free Russian village community. In its conditions of land tenure, it resembles the eastern and western mark system. Both probably came from a common Aryan origin. As now constituted, each village has its *Mir* or popular assembly administered by an "elder." The *Mir* itself, however, performs the periodical assessments and distribution of the common land, which is cultivated on the "three-field system" by the whole community working together. After harvest, the fields are common pasture. Owing to the encroachments of neighbouring large proprietors, the communities seem to have lost their ancient rights of common woods and pastures. When required, these are now rented from the neighbouring landowner. Each household may, by repaying the sum advanced by the state for its acquisition, become the private owner of land; and this, says Mr. Kovalevsky, "unless communistic doctrines come to the rescue, threatens the *Mir* with extinction."

MIRABEAU, VICTOR RIQUETTI, marquis de (1715-1789), sometimes described by his pseudonym as *L'Ami des Hommes*, or distinguished from his son, the Comte de MIRABEAU, by the names of Mirabeau *père*, Mirabeau *aîné*, the elder Mirabeau, or the marquis of Mirabeau.

He was born at Perthuis in Provence, where his ancestors, the Riquetis, had settled in the 13th century after being driven out of Italy. In his youth he served as an officer in the army, and was decorated for his bravery in the Bavarian campaign. In 1737 he succeeded to his father's title and estates, and quitted the army, soon afterwards embarking upon the studies of rural and political economy, in pursuit of which he exhibited unwearied energy for half a century. He came early in life under the influence of the views of CANTILLON, but subsequently became an enthusiastic adherent of QUESNAY and one of the leaders of the PHYSIOCRATS. Quesnay indeed was the quasi-sacred founder of the sect, and originator of its creed, but Mirabeau was the militant chief of the school; and, after Quesnay's death in 1774, he became its acknowledged head. The history of his domestic severities, his protracted quarrels and fifteen years of lawsuits with his wife, and his rigour towards his children, which drew down upon him the jibe that he was at once *l'ami des hommes et l'ennemi de sa femme et de ses enfants*, show us that, like Rousseau, he was sometimes unable to harmonise the sourness of his conduct with the sweetness of his counsels. But they also make more than ever remarkable the amazing activity with which he found time to carry out numerous hardy and unremunerative agricultural experiments, to act as the social centre of the ÉCONOMISTES (*q.v.*) at his Tuesday receptions, and to produce a crop of propagandist literature in books, in newspapers, in letters, and in lectures, almost unequalled in volume and in vigour; while his tenderness for his mother and his affection for his brother, the bailli de Mirabeau, with whom he exchanged upwards of four thousand lengthy letters equally devoted and didactic, prove—what is otherwise abundantly clear—that his family troubles would not have arisen without the gravest faults on the side of his wife and his sons.

Educated, as he says, in a mountain chateau by "a tutor at thirty crowns," and quitting college at the age of thirteen, the marquis of Mirabeau owed his erudition chiefly to his own application and assiduous study. In 1747 he wrote an (unpublished) *Testament politique* for the guidance of his son, as yet unborn; and inspired by ambition for the aggrandisement of his family, urged the future enemy of aristocratic privilege to defend his order against encroachments of the royal power! The reactionary tone of this document is little in keeping with his later views. He continued to ruminate upon the art of government: "12 principles laid down in 12 lines, and graven in the head of the prince or his minister would," he thought, in 1749, "if strictly carried out in detail, correct all the abuses of society and bring back the age of Solomon." A friend of VAUVENARGUES, an admirer of MONTESQUIEU, and presenting in himself, as DE TOCQUEVILLE has observed, the spectacle of a feudal character invaded by democratic ideas, he was already given to philosophise upon statesmanship, and wrote a *Système politique de la France*, which remains in manuscript. But it was in 1750 that he published anonymously his first treatise, the *Mémoire concernant l'utilité des États provinciaux*, 12mo, Rome;[1] a plea for a measure of decentralisation and local self-government, considered by Lavergne to be the most substantial of his voluminous economic and political works, and at first attributed by a judge so competent as D'ARGENSON to Montesquieu himself. Contrasting the systems of the *pays d'élection*, where the repartition of taxes was effected from above by the authority of the intendant, a royal officer, and the *pays d'état*, where the repartition rested upon the local and mutual decision of the taxpayers, he concluded strongly in favour of the latter as more equitable and more profitable to the treasury, and recommended the general establishment of local assemblies adopting its best features. His views contributed largely to the creation of such bodies in 1787; but they were swept away with the monarchy before they could take root. (For *pays d'élection* and *pays d'état* see INTERNAL CUSTOMS AND TOLLS.)

In some manner not yet accounted for, Mirabeau had obtained, and for many years retained, possession of the unpublished manuscript of Cantillon's *Essai sur la Nature du Commerce en général*, when the rightful owner recovered the *Essai* and caused it to be printed and published in 1755. The manuscript had made a deep impression on Mirabeau. At one time he seems to have intended to modify and publish it as his own. Subsequently he proceeded to write a running commentary upon the *Essai*, and it is the work thus commenced which appeared, subsequently to the publication of Cantillon's manuscript, under the title of *L'Ami des Hommes, ou Traité de la population*, in three parts, with the imprint à Avignon, 1756, 4to and 12mo. This remarkable treatise created the greatest sensation throughout the whole of Europe. It is said to have gone through forty editions, and was translated into several languages. Its anonymous author, soon discovered, became the idol of the day, and was generally referred to by the sobriquet which he had chosen for the title of his book. The meridional vivacity of his style, his wit, his naïve egotism, his piquant irony and frequent paradox gave him a great literary vogue, and led some of his readers to compare him to MONTAIGNE; while the importance of his subject and the ability of his views, in

[1] "Rome" was a false imprint. The book was really published in France.

turn original, daring, and profound, earned for him the more durable attention of those who cared rather for the matter than the style. The prodigal luxuriance of his ideas, unconnected by any firm and consistent grasp of principle, makes his book comparable to a pathless tract of tangled jungle, and renders it impossible to summarise it succinctly. But its leading assertions are the following: Population is the source of wealth, and the means of subsistence are the measure of population. Agriculture is the great source of subsistence. A large population is desirable; and to this end the encouragement of agriculture is the means. "Men multiply like rats in a barn if they have the means of subsistence." Luxury, idleness, and public debts are to be reprobated. The very rich are "like pikes in a pond." The influx from country to town should be counteracted and absenteeism should cease. Religious toleration, free trade—internal and external,—a more equal distribution of wealth, a diminution and more equitable partition of the burdens of taxation, are among the *desiderata* for the economic improvement of the country; and a ministry of agriculture should be created for its encouragement and support, to keep pace with the aid which science can render to agriculture, and to favour the development of canals, modes of communication, drainage, etc. The peasant is everywhere to be held in honour, and the king's ideal should be to be a *roi pasteur*. The hardihood of the author may be sufficiently indicated by two quotations. In his preface he personifies "la voix de l'humanité qui réclame ses droits"; and in his conclusion he apostrophises the king in favour of that class of his subjects which is "the most useful of all, those who see beneath them nothing but their nurse and yours—mother-earth; who stoop unceasingly beneath the weight of the most toilsome labours; who bless you every day and ask nothing from you but peace and protection. It is with their sweat and (you know it not!) their very blood that you gratify that heap of useless men who keep saying that the greatness of a prince consists in the value, and above all, the number, of favours he divides among his courtiers, nobility, and companions. I have seen a tax-gathering bailiff cut off the wrist of a poor woman who clung to her saucepan, the last utensil of her household, which she was defending from distraint. What would you have said, great Prince?" etc.—Evidently some of the qualities of the younger Mirabeau were inherited from his father.

After reading *L'Ami des Hommes*, QUESNAY, who agreed with many of the author's opinions, desired to make his acquaintance, and Mirabeau has left a graphic account of their interview, in which Quesnay persuaded him that wealth is the source of population, not population the source of wealth. Mirabeau now became the fervent admirer of Quesnay, and between them they founded the school of the physiocrats. As Madame de Pompadour's medical attendant, Quesnay was unable to quit his post at Versailles day or night. His position at the court also imposed upon him some delicacy and reserve in openly criticising the government. The tempestuous marquis supplied in himself more than enough of initiative, energy, courage, and resource. The deference which he always exhibited to Quesnay enabled the latter to hold him somewhat in check by frequent correspondence, reading his proofs, chastening his style, and amending his views. But the impetuosity of Mirabeau was not to be wholly curbed; and he remained to the last perhaps the most independent member of "the sect."

In 1758 appeared a continuation of *L'Ami des Hommes* (pt. 4, no imprint; 4to and 12mo), in which the hand of Quesnay is plainly visible. It consists of a *Dialogue entre le Surintendant d'O. et L. D. H.*, a reprint of the *Mémoire sur les États provinciaux*, with a reply to objections which had been published against it, and a series of, separately paged, *Questions intéressantes sur la Population, l'Agriculture, et le commerce proposées aux Académies et autres sociétés sçavantes des Provinces*, asking for local information upon agricultural conditions, and also suggesting some general considerations somewhat in the style of Berkeley's *Querist*. These questions, the reader is informed, are not by the author of the *Mémoire sur les États provinciaux*. In 1760 appeared the fifth and sixth parts, without publisher's name or place of publication,—the whole forming three quarto or six 12mo volumes. The fifth part contains the essay written for the prize of the Berne Agricultural Society in 1759 on the reasons why Switzerland should prefer to grow corn. This is followed by extracts from the first six books of an English work, translated from Hale's *Complete Body of Husbandry*. The sixth part (no separate title page) is made up of a *Réponse à l'Essai sur les Ponts et Chaussées, La Voierie, et les Corvées*, and by the *Tableau Oeconomique avec des explications*. Mirabeau had already denounced the CORVÉE in his *Mémoire*, and he now replies to a supporter of them. His "explanation" of Quesnay's *Tableau* involves some manipulation of the original in order to make it comprehensible to himself and others. But it is doubtful whether Mirabeau with his small capacity for consecutive reasoning ever fully understood the harder-headed Quesnay any more than he had rightly understood Cantillon.

The same year which terminated the *Ami des Hommes* saw the publication of a *Théorie de l'Impôt*, (1760, 4to and 12mo, no imprint), a work of considerable ability which seemed

likely to create an almost equal stir. No one could doubt who was the author. "Seigneur," he begins, in the tones already noticed of exhortation and of hardly-veiled menace, "Seigneur! you have twenty millions of subjects, more or less, all with a little money and almost all capable of rendering you such service as you require; and yet you can no longer obtain service without money nor money to pay for service. In plain language, your people hold back from you without knowing it, for they are still well-disposed to your person even though they be not to the agents of your authority." And he puts into the mouth of the king the soliloquy that his position as the head of his people is justified only so long as, and only because, he costs them less than he is worth to them. If, as the author asserts on his first page, "nous sommes en un siècle mol et craintif," he shows clearly enough that he is himself not lacking in temerity. He was, for his boldness, imprisoned (16th December 1760) in the chateau of Vincennes. The king was furious against him; but ultimately yielded to Madame de Pompadour and Mirabeau's friends, and allowed him to be liberated on Christmas eve, with orders to reside at his property at Bignon, and not in Paris. For two and a half years the physiocrats held silence in the press, and taught by word of mouth. In 1763 Mirabeau made a convert of DUPONT DE NEMOURS, who, writing in 1769 of the *Théorie de l'Impôt*, says, "This sublime work has to my knowledge been multiplied by eighteen editions." It is not, as might be supposed, a mere plea for the IMPÔT UNIQUE. It proposes a reorganisation of financial administrative machinery, the abolition of the Fermes (see FARMER-GENERAL), a reduction in the taxation upon salt, with the object of increasing the total yield, and a special tax upon tobacco farms. The DOMAINE, the post, and the MINT were to be further sources of revenue. Many just and valuable remarks on taxation are scattered throughout the volume, and entitle the author to rank as one of the earliest important writers on the subject. In 1763 appeared his *Philosophie rurale*, Amsterdam (Paris), 4to, "the best, or the least bad," says DAIRE, "of all his works." It is the most complete and compact account of his physiocratic views, for which the reader is referred to the article PHYSIOCRATS, and owed a good deal to Quesnay, by whom, Dupont states, the whole of the seventh chapter was written.

Mirabeau received the grand cross of Wasa from Gustavus III. of Sweden on the foundation of the order, and counted among his other notable admirers and correspondents, Leopold, grand-duke of Tuscany, afterwards Emperor of Austria, Stanislas-Augustus, king of Poland, and KARL FRIEDRICH, grand-duke of Baden. The dauphin boasted that he knew *L'Ami des Hommes* by heart; but, when it was proposed to place the *Éphémérides* under his protection, though Quesnay, Dupont, and TURGOT agreed to the plan with its prospect of shelter from too rigid censorship, and though the dauphin had himself approved of the terms of the proposed dedication, Mirabeau refused to be a party to the project, and threatened to withdraw if it were adopted. His threat, which prevailed, indicates his dominant influence in the party and his independence of his colleagues. As has already been indicated in the course of this article, Mirabeau was one of the first to perceive an important principle of POPULATION, and to express a belief in what has since been called the elasticity of the exchequer; but his chief economic importance lies in his powerful support of physiocracy.

The limits of this article admit of little more than an enumeration of his other principal works. According to M. de LOMÉNIE (*q.v.*) he left forty volumes, besides several unpublished writings. His popularity waned after the lawsuits which followed upon his quarrel with and separation from his wife in 1757, the odium which he incurred from the stern measures he adopted to repress his profligate and spendthrift son by imprisoning him at Vincennes and elsewhere, under *lettres de cachet*, and the success of the latter in unjustly inflaming the public mind against an *Ami des hommes*, whom he painted as a demon of harshness and inhumanity. It could hardly fail to lend colour to prejudice that the writer who declaimed so vigorously against absenteeism was hardly ever present in his own property, that, much as he disapproved of public debts, he incurred with fatal facility an increasing burden of private loans, that for an expert in rural philosophy his agricultural experience was singularly unfortunate, and that having denounced *lettres de cachet* in his writings he employed them against his own household in profusion. He died 13th July 1789, the day before the storming of the Bastille.

His later writings often appeared anonymously and in foreign countries, by the care of his friends. Such are *Les Devoirs*, Milan, 1770, 8vo, seen through the press by the Marquis de Longo, professor of political economy at Milan. (Men should receive economic instruction as a guide to conduct. And so elementary education should be *compulsory, and free* where the recipient cannot afford to pay). —*Entretien d'un jeune Prince avec son gouverneur par L. D. H.*, Publié par M. G. . . . (l'abbé Grivel), Paris, 1785, 4 vols. 8vo and 12mo.—*Hommes à célébrer pour avoir bien mérité de l'humanité par leurs écrits sur l'Économie politique. Ouvrage publié par P. Boscovitch, ami de l'auteur*, Bassano, 2 vols. 8vo.—Mirabeau was one of the principal writers in the ÉPHÉMÉRIDES du citoyen (1765 to 1768), and the *Journal de l'agriculture, du commerce, et des finances* (1764 to 1774).—Among his other works may be mentioned *Réponse du correspondant à son banquier*, 1759, 4to (a reply

to FORBONNAIS).—*Éléments de philosophie rurale*, La Haye, 1767, 12mo (an abridgment of the *Philosophie rurale*).—*Lettre sur le commerce des grains*, Amsterdam and Paris, 1768, 12mo.—*Les Économiques par L. MIRABEAU, HONORÉ GABRIEL RIQUETTI, Comte de (1749-1791), born at Bignon near Nemours, and died in Paris.

A son of the Marquis of MIRABEAU (*q.v.*), the many wild incidents of his stormy life and the extraordinary force of his character caused him to occupy a very different position in general history from his father. The political career of the son is bounded by little more than two years (1789-1791), but during them he won an immense though an evanescent influence, and seemed for a moment as if he would have swayed the whole course of the revolution. "One can say that, had Mirabeau lived, the history of France and of the world had been different," Carlyle, *French Revolution* (chapter on "Mirabeau"). Here, however, we are concerned only with his economic reputation, which was far inferior to that of his father.

Though not a dogmatic economist, he employed his wonderful eloquence on subjects distinctly economic in character. Setting aside his dissolute youth and certain works regrettable for his reputation, and willingly omitting his acrid political writings, his pamphlets on *La Caisse d'escompte*, *la Banque Saint-Charles*, *la Compagnie des eaux*, and even his *Dénonciation de l'agiotage*, though they are polemical in character and directed against individuals and particular interests, and his speeches at the national assembly deserve attention, peculiarly the *Discours contre la banqueroute* (26th September 1789). The speeches and opinions of Mirabeau were published by Barthe in 1820, 3 vols. 8vo, and more recently by M. A. Vermorel, 5 vols. 12mo, in the *Bibliothèque Nationale*. A. C. F.

[See also LOMÉNIE, LOUIS DE.]

MIRO, VICENZO DE (18th century), was regent of the supreme council of Italy. Charles VI. emperor of Germany and archduke of Austria, appointed him president of the commission of 1718, summoned to organise a new census for the state of Milan. This census was celebrated in the history of taxation. The object of the system proposed was to remedy the inequalities of the ESTIMO (*q.v.*) fixed in 1548, and to establish a fair proportion between the payments of the contributors.

The commission presided over by Miro fixed the basis of the taxation, proposed the regulations required, and almost completed the whole work. Miro remained in office until 1731. The labours of the commission were interrupted by the war in 1733. The work was resumed in 1749 by a second commission, under the presidency of Pompeo NERI (*q.v.*). This was dissolved in 1758. A government commission rearranged the CATASTO (*q.v.*) in 1760.

[Carlo Lupi, *Storia dei principii delle massime e delle regole seguite nella formazione del catasto prediale introdotto nello stato di Milano l' anno 1760*. Milan, 1825.] U. R.

MISSELDEN, EDWARD (early 17th century), was deputy-governor of the merchant adventurers company at Delft between 1623 and 1633, and negotiated a private treaty with the Dutch and the East India Company, who employed him from 1624 to 1628 in their negotiations about the Amboyna outrages. He had various missions on behalf of the merchant adventurers. The appointment of the standing commission on trade in 1622 give rise to his—

Free Trade, or the Means to make Trade flourish; wherein the causes of the decay of trade in this kingdom are discussed, and the remedies also to remove the same are represented (Lond., 1622, 8vo, reprinted in 1651). The author points out (I.) the causes of the want of money here, which are (*a*) the value of English coins. These are current at a higher rate in Holland, whither the money is attracted. (*b*) The excessive consumption of foreign commodities. (*c*) The want of an East India stock here. (II.) The causes of the foreign want of money, which are (*a*) the recent wars; (*b*)

the trades maintained out of Christendom with ready money. The causes of the decay of trade are found by Misselden to be the scarcity of money and the want of the East India stock, also usury and heavy lawsuits. The fish trade is decayed by the encroachments of strangers on our coasts. The disturbances in the cloth trade, the ill-making and false-sealing of cloths, are also blamed. The export of wool and wool-fells is a grievance; and the author censures the merchants adventurers for their heavy impositions on English cloths. Ch. iii. deals with monopoly; and ch. iv. with the want of government in trade. The remedies proposed by Misselden are to make foreign coins current at equal value with our own, and so keep the money in the realm; to reform excessive consumption of foreign commodities by allowing only certain imports, say of the tobacco grown in Virginia or the Bermudas only. Merchant ships ought, he says, to go in fleets together for safety. The remedy for usury he finds to be the plentiful circulation of money and bills of exchange, and he advocates the total uprooting of monopolies. MALYNES (*q.v.*) attacked Misselden as overlooking "the predominant part of trade"—viz. the mistery of exchange. The latter replied in *The Circle of Commerce: Or the Balance of Trade, in defence of Free Trade, opposed to Malynes Little Fish and his Great Whale, and poized against them in the scale; wherein also exchanges in general are considered*, J. Dawson for N. Bourne, Lond., 1623, 4to. A. L.

[*Dict. of Nat. Biogr.*, xxxviii. pp. 51-2.]

MISTERY (or MYSTERYE; MYSTERY is a form dating from the 17th century), was a common designation in the later middle ages for a body of persons engaged in a particular branch of manufacture or trade, not in their capacity as individuals but as an organised group. It has no etymological connection with μυστήριον; and its association with that which is "mysterious" belongs to an age when its original meaning was forgotten. It is derived from the Latin *ministerium*, through the mediæval form *misteria*; and it was used precisely in the same way as the French forms *mistere, mestrer, mestier*, and *métier*. Its introduction into England was probably due to the use of French in official documents; and the native English term, which was used side by side and interchangeably with it, was *Craft*. W J. A.

MOFFAT, ROBERT SCOTT (19th century): The author of *The Economy of Consumption: An Omitted Chapter in Political Economy* (1878), in which Mill's theory of capital, his doctrine that there cannot be a general over-production of commodities, and other approved tenets and authors, are subjected to a hostile criticism. The practical outcome of the work is to recommend as "the true policy of the labourer" what is called a time-policy —that is, the limitation of the hours of the work, rather than of the rate of the wages. A portion of the work relating to this policy is reprinted as a separate book, entitled, *The Principle of a Time-Policy, being an Exposition of a Method of Settling Disputes between Employers and Labourers in regard to Time and Wages by a simple process of Mercantile Barter, without recourse to Strikes or Locks-Out* (1878). In the preface some reviews of the preceding work, one of them by Cliffe Leslie, all of them exceedingly unfavourable, are quoted at some length and rebutted. The author further enforces his principle in a letter to Lord Justice Bramwell on the *Regulation of Production*. He also wrote *Henry George the Orthodox*.

F. Y. E.

MOHEAU. This statistical writer of the 18th century scarcely received at the time the due acknowledgment of his deserts. Even his book *Recherches et Considerations sur la Population de la France*, was attributed by Lalande, in the *Journal des Savants*, to Montyon, who (see Meitzen, *History of Statistics*) assisted in the work. The first portion of the *Recherches* contains statistical tables, the second is devoted to the analysis of various causes likely to influence population.

The dedication "*à un roi*" is dated 1774, and the permission to print it, 1777 (*Dict. de l'économie Politique*, art. "Moheau.")

Moheau's work was published in Paris, Montard, 1778; 2 books of 280 and 160 pp. in 1 vol. 8vo.

[M'Culloch, *Literature of Pol. Econ.*, p. 264, speaks highly of it, moreover recommending his book as a model for similar work.] A. L.

MOHL, ROBERT VON (1799-1875) was successively professor of political science in the universities of Tübingen and of Heidelberg, an official in Wurtemberg, the minister of justice of Germany under the government of the Frankfort parliament of 1848, and the representative of Baden at Frankfort and Munich (1861-1871). At his death he was a member of the German Reichstag representing an electoral district of Baden.

His literary activity was considerable, his subjects being public and administrative law. His two principal works are the *Polizeiwissenschaft* (3rd ed. 1832-34, 1844-45, and 1866) and the *Geschichte und Litteratur der Staatswissenschaften* (1855-58). Mohl does not take the word *Polizei* in its present restricted sense of repressive justice, but in the wider sense of internal and administrative state-policy, as it was often understood by old German and French writers. According to his own definition, the *Polizeiwissenschaft* is "the systematically ordered science, which explains the principles on which the state ought to interpose to protect its citizens against overpowerful external hindrances," but his book only deals with the principles of the science in the *Rechtstaat*, or legal state, by which he means the state "where the collective life of the nation is so ordered that each individual member is helped and assisted towards the utmost possible free and many-sided display and utilisation of his individual energies." In the *Rechtstaat*, the scope of the state is thus mainly negative, although many not purely negative interferences may be sanctioned on motives of expediency and in new cases. For instance, Mohl would not be adverse, in cases of over-population, to compul-

sory emigration enjoined according to a lottery arranged much on the same basis as the military conscription in force on the continent. For all this, on the whole and in principle, the views of Mohl are those of a liberal statesman.

Mohl's *Geschichte und Litteratur der Staatswissenschaften*, is not written on the ordinary plan of a continuous history of development, but under the form of bibliographical monographs. It is a real monument of both historical and critical learning. It only deals with modern states after the end of the middle ages.

[Cohn, *Hist. of Pol. Econ.*] E. CA.

MOHUR. The Indian government mohur is a token gold coin valued formerly at the sum of 15 standard silver rupees. It weighs 180 grains (the same weight as the silver rupee), and is composed of gold of the millesimal fineness of 916·6̇. Its intrinsic value in sterling is £1 : 9 : 2½ (11½ fine), whereas the gold value of 15 rupees, owing to the low price of silver, has been fixed since 1893 at £1 (1 rupee = 1s. 4d.). The gold coins of India are, however, in practice bought and sold as bullion.

Besides the mohur there are gold pieces of the nominal value of 30, 10, and 5 rupees; these coins being proportionate in weight to the mohur, and of the same fineness. Prior to 1835 mohurs of slightly different values were issued in the three presidencies. The Madras mohur was of the same weight and fineness as the present coin; that struck in Bombay weighed 179 grains of gold 920 fine; while that issued at Calcutta was, from 1818 onwards, of the weight of 204·7 grains, 916·6̇ fine, and from 1793 to 1818 had been of the weight of 190·894 grains, 995·7 fine.

[R. Chalmers, *A History of Currency in the British Colonies*, 1893.] F. E. A.

MOHUR, HISTORY OF. A gold coin of northern India (Persian *muhr* "a seal"). Like the silver RUPEE, the gold mohur probably represents the old Indian weight of 100 *ratis* (seeds of *Abrus Precatorius*), or about 175 grains, and dates back perhaps to Vedic times. Its weight has fluctuated with the endeavour to maintain a ratio between silver and gold. Thus, in the 14th century the weight of the mohur was raised to about 200 grains, but gradually reverted to the ancient type. In 1766 the East India Company struck for Bengal a mohur, which for the first time was declared to be a legal tender of payment, as the equivalent of 14 sicca rupees; its gross weight was 179·67 grains, 833·33 fine, containing 149·72 grains of fine gold. In 1769 the Bengal coin was increased in gross weight to 190·773 grains of *sequin* fineness, containing 190·1 grains of fine gold, which was to be legal tender for 16 sicca rupees. In 1818, when the fineness was reduced to eleven-twelfths in accordance with the Company's principle of 1806 (see *infra*), the gross weight of the Bengal 16 rupee mohur was raised to 204·7 grains, making the fine weight 187·6 grains. In Bombay the mohur was not legal tender, but was approximately the equivalent of 15 Bombay rupees. From 1774 its gross weight was 17 grains, the millesimal fineness being 953 in 1774, and 920 from 1800 to 1833, with the result that the fine content of the "old" mohur was 170 grains as against 164·7 grains for the newer coin dating from 1800. Lastly, in 181 the Company struck a mohur for Madras, whic was to be a legal tender to government alone a 15 rupees. The following principles, whic were embodied in the Madras coin of 1818, wer laid down by the Company in 1806: "Althoug we are fully satisfied of the propriety of th silver rupee being the principal measure o value and the money of account, yet we are b no means desirous of checking the circulatio of gold, but of establishing a gold coin on principle fitted for general use. This coin, i our opinion, should be called a gold rupee, an be made of the same standard as the silve rupee, viz. 180 troy grains gross weight, an 165 troy grains fine gold." In 1835 by Ac XVII. the Company, in striking one uniform coinage for the whole of its dominions, and i establishing the Madras mohur as the type fo the new Company's mohur, enacted that "n gold coin shall henceforward be a legal tende of payment in any of the territories of th East India Company." The same principle were observed as regards the governmen mohur by Act XIII. of 1862, when the Company' rule came to an end, and again by section 1 of the India Coinage Act, 1870. The weigh and fineness of the coin have not been change since 1818.

[Bengal, *Regulations of the East India Company* Nos. xxxv. of 1793, xlv. of 1803, xiv. of 1818;—India Office records.—Sir James Steuart's *Principle of money applied to the present state of the coin o Bengal*, 1772.—Yule, *Hobson-Jobson, Gloss. o Indian Terms used in English*, 1886, pp. 438-39. R. C.

MOIDORE (PORTUGUESE). The Moeda d Ouro (or gold money) was a Portuguese coi issued from about the year 1640 to the yea 1732. It was of the millesimal fineness o 916·6̇ and weighed 83 grains, being, therefore, o the sterling value of 13s. 5½d. A double Moed de Ouro was also issued, and it is to this coin which had a world-wide circulation, that th name "moidore" is usually applied. F. E. A.

The coin known by this name, also calle the Lisbonnine, was reckoned equal to 1 crusados or 4000 reis; in 1688 Peter II. raise its rating to 4800 reis. Its uniform goodness fineness, and weight, soon made it a favourit coin both in Europe and in the British colonies Early in the 18th century, for instance, it wa the chief coin current in Ireland, and ha established itself in the West Indies, mor particularly at Barbados.

In Ireland it had appeared before the close of the 17th century, coming in, as Sir Isaac Newton tells us, in course of trade; rated at 28s. it was over-valued, and drove out silver and other gold, so that at the beginning of the 18th century, according to a contemporary writer, they were "reduced to moydores, the most inconvenient coin of all others in our present circumstances." Before the rating was reduced the coin had also spread over into, and become common in, the West of England.

In Barbados, whither it came about 1705, it passed for 35s. till 1715, and afterwards at 37s. 6d. And, although Mr. Chalmers calls it comparatively unimportant in the West Indies as compared with Spanish gold, in Barbados for many years the moidore was the usual coin named in local advertisements, and was clearly the most prominent coin in the island.

In spite of not being struck after 1732, it long remained in circulation, and only gradually gave way to its successor the JOHANNES (*q.v.*). The popular rating of the coin in English money was 27s., based on Sir Isaac Newton's rating in 1717, when he distinguishes between doppia moeda "new coined" 26s. 10½d., doppia moeda "as they come to England," 26s. $9\frac{19}{20}$d.

[Kelly's *Cambist*, 1831.—Eckfeldt and Dubois, *Manual of Gold and Silver Coins*, Philadelphia, 1851.—Chalmers, *Colonial Currency*, p. 396.]

C. A. H.

MOLESWORTH, SIR WILLIAM (1810-1855), eighth baronet, was educated in Germany; he afterwards went to Cambridge, whence he was expelled for challenging his tutor. He completed his studies at the university of Edinburgh. Molesworth was M.P. for East Cornwall from 1832 to 1837, following generally the lead of Grote, to whom he had been introduced by C. Buller. In 1835 he founded the *London Review*, which, after a few numbers, first by itself, and then of joint life with the *Westminster Review*, was finally, in 1837, absorbed in the latter. Molesworth's most noteworthy contributions are stated to have been "On the Orange Conspiracy," and "On the policy of the Radical Party in Parliament," (*London and Westminster Review*, April 1836 and January 1837). From 1837 to 1841 he represented Leeds in parliament. In the former year he obtained a committee of the House to inquire into the system of TRANSPORTATION (*q.v.*), and wrote the report, which strongly recommended its discontinuance. The four years 1841-45, during which he had no seat in the House, were mainly devoted to editing the works of HOBBES (*q.v.*). He returned to parliament in 1845 as member for Southwark, which seat he held till his death. From this time he chiefly applied himself to questions connected with the colonies. He strongly advocated the granting to them of complete self-government, and supported the views on colonisation of E. Gibbon WAKEFIELD (*q.v.*). There appears to have been considerable satisfaction in the colonies, when, after being first commissioner of works in Lord Aberdeen's government in 1853, Molesworth was made by Lord Palmerston, in 1855, secretary of state for the colonies. His period of office was too short for him to fulfil such expectations, but it may be noted that an act of his, in appointing a Canadian to the governorship of the Windward Islands, pointed the way to a method of consolidating the empire which is, at length, being followed. Molesworth was not a man of much originality of mind, nor a great orator or debater. He only spoke after laborious preparation, and his speeches, many of which were published, were of the nature of essays. He deserves notice as the first of the radicals to attain cabinet rank, though the peculiar kind of philosophic radicalism to which he adhered found little favour, on some grounds, with other members of the party.

[Molesworth's only literary work except articles in reviews, none of which were republished, and speeches, was an edition, in 17 volumes, of the *Works Latin and English of T. Hobbes*, London, 1839-46, 8vo.—See *Notices of the late Sir W. Molesworth* (privately printed), London, 1857, 8vo.—The *Dictionary of National Biography*, vol. xxxviii. notice by Mr. Leslie Stephen, which refers to *Philosophic Radicals of 1837* (privately printed) by Mrs. Grote, London, 1866.]

H. E. E.

MOLINA, LUDOVICUS (1535-1600), a distinguished Jesuit theologian of the 16th century, was a Spaniard by birth, and taught at Coimbra and Evora in Portugal. He was the author, among other works, of a treatise *De Justitia et Jure* (1593-1600), which dealt at considerable length with usury and the relation between business practices and moral theology (see INTEREST AND USURY). It was reprinted more than once, after his death, and exercised considerable influence on the subsequent development of economic thought.

[W. Endemann, *Studien in der romanisch-kanonistischen Wirthschafts- und Rechtslehre* (i., 1874, ii., 1883), treats him as a signal example of that method of argumentation which, in his opinion, finally took away all practical force from the earlier canonist doctrine, see especially, i. 385, ii. 118, 249; cp. Ashley, *Econ. Hist.*, i. pt. ii. 452.]

W. J. A.

MOLINÆUS, CAROLUS, the Latinised name of Dumoulin, Charles (1500-1566), a distinguished jurist of Paris, was the author of *Extricatio Labyrinthi de eo quod interest*, and *Tractatus contractuum et usurarum redituumque pecunia constitutorum* (both in 1546), and of some other pamphlets on the problem of usury. In these, especially in the *Tractatus*, he criticised the canonist doctrine with a freedom which aroused a storm of condemnation. He was

forced to leave France, and his book was condemned to be burnt and put on the *Index*. In 1553 he accepted a professorship at Tübingen, and soon afterwards became a member of the council of the Duke of Würtemberg.

The opposition he encountered is not to be attributed to his practical conclusions, which scarcely went beyond some contemporary canonists of high authority, as NAVARRUS DE AZPILCUETA. Like them Molinæus approved of a regulation of interest by authority, and condemned uncharitable dealings. What seems to have distinguished him was his attack on the theory of usury itself,—his denial that all payment for the use of money was forbidden by holy writ, and bad in itself. The point at issue might seem to be a purely verbal and technical one: whether gain could be contracted for in consideration of a "loan" (MUTUUM) *eo nomine*. According to the current definition of the canonists, *mutuum* involved so complete a transference of property, that payment for the *use* became inconceivable. But what was really involved was the whole conception of usury, which the Roman Catholic Church was not disposed to abandon, and has not abandoned to the present.

MOLLIEN, FRANÇOIS NICOLAS, Comte, (1758-1850) born at Rouen and died at Paris, was one of the ablest administrators of finance during the first empire. He began at the age of sixteen in the office of the FARMER-GENERAL, which he left in 1791 for cotton-spinning in the environs of Evreux (Eure). In 1799 the first consul summoned him back to office, and entrusted him with the administration of the sinking fund, then just instituted. Mollien discharged the duties of his office with the most absolute honesty and with great ability, order, and punctuality. The emperor, who highly appreciated these qualities, appointed him, 27th January 1806, minister of the treasury in the place of Barbé-Marbois, who had been unable to defend himself against the insidious manœuvres of Ouvrard. Mollien held this post during the empire and the *cent jours*. From 1801 to 1815 the treasury was separated from the department of finance, strictly so called, and constituted a separate department. Under the restoration and the government of July, Mollien accepted no public office, though he was twice offered the administration of finance in the early part of the reign of Louis XVIII., but in 1819 he was made a peer and in this quality sat in the Luxemburg until 1848.

In many pamphlets on subjects of the day (1818), in parliamentary reports and some scattered notes, Mollien produced work of great value. He began to write, after 1817, his *Mémoirs d'un ministre du trésor public*, 1780-1815, 4 vols. 8vo, 1845. In 1837 a first, but very imperfect, edition was published. This remarkable work has never been on sale, and copies of it are very rare. The absorbing personality of Napoleon I. did not allow Mollien's talents their full value; but his memoirs exhibit the solidity of his intellect, the sincerity of his statements, and the breadth of judgment which he applied to the incidents passing under his eyes, and to the events on which it is to be regretted that he had not a greater influence. Mollien was a man of strong character, and notwithstanding his devotion to Napoleon, who in his eyes represented France from 1800 to 1815, he maintained the right of expressing his opinions freely and his independence. At the council of state before 1806, and as minister of the treasury, he had often to oppose the ideas of Napoleon, who, however, was never displeased with him. He even sought his conversation and invited his criticism. Napoleon was not displeased with the boldness of Mollien, who after his conversations with the head of the state reproduced the whole of them in his memoirs. This gives that book its great importance. It is known that Mollien's father, a leading merchant, put the *Wealth of Nations* into the hands of his son as soon as the translation of Germain Garnier was published. The reading of this early fixed Mollien's views on the great truths of economics, as the perusal of his memoirs proves.

[See W. Bagehot's *Econ. Studies* (ed. 1880, p. 2), and his reference to Napoleon's phrase *Ce bon Mollien qui me donne des francs pendant que les autres ne me donnent que des idées.*—Also Cl. Jannet in *Le Capital, la spéculation et la Finance au XIX^e siècle* (1892).] A. C. F.

MOLMEN were a class of manorial tenants defined by Vinogradoff (*Villainage in England*) as "rent-paying tenants who may be bound to some extra work, but who are very definitely distinguished from the 'Custumarii,' the great mass of tenants who render labour services." He regards them as standing below the freeholders, but as having risen from real serfdom by getting their tenure fixed and their services commuted, drawing this distinction between *mal* (a Danish word = rent) and GAFOL, that the former was a commuted, the latter an original money payment. If this view is correct—and the matter can hardly be regarded as settled—the chief interest of molmen and of their holdings, "molland," is the illustration they afford at an early period of the process by which the villeins in general afterwards became free. The word is of fairly frequent occurrence, especially at the time of Edward I.

[*English Hist. Review*, articles by Elton and Vinogradoff, July 1886, Round, January 1887, Stevenson, April 1887. For law of dower and female inheritance among molmen and for some differences between "mollond" and "werklond," see Archdeacon Hale, *Domesday of St. Paul's.*] E. G. P.

MOLSTER, JOHANNES ADRIAAN (1827-1889).

A Dutch lawyer and writer of essays on public subjects in reviews, was the author of a *Geschiedenis der Staathuishoudkunde* (Amsterdam, 1857), a history of political economy, interesting for the information given in it on Dutch economic literature. E. Ca.

MONCADA, Sancho de (beginning of the 17th century) lectured on theology in the university of Toledo, and published, in 1619, eight *Discursos* on various economic subjects, which were the uncompromising expression of the prohibitive tendencies then prevalent in Spain, and, consequently, obtained a wide celebrity among his countrymen. They were republished at Madrid in 1746 under the title *Restauracion Política de España*. Moncada does not admit for a moment that the wars abroad, the system of laws, the excessive number of idle persons, the debasement of the currency, etc., could fairly be looked upon as responsible for the depressed state of Spain: "the misfortune of Spain flows from the trade with foreigners, who carry away our raw material and our silver," p. 9, ed. 1746. His only remedy is the prohibition of exports of raw materials and precious metals, and of the imports of manufactured articles, enforced by the penalty of death pronounced against smuggling, and the delivering to the Inquisition of all persons accused of exporting money, "as this money is going to assist the enemies of the church," p. 40 of the 1st Discourse, *Riqueza Firme de España*. Still Moncada is aware that the influx of American gold and silver, had brought about the general rise of prices, which had put Spanish industry at a disadvantage in its competition with foreign countries, where the rise of prices was proceeding more slowly, *Disc.* on *España con Moneda*, p. 54.

Moncada concludes by demanding the erection of a special university for political science in Madrid, and the institution of lectures on the same subject in the provincial universities. These lectures are to be delivered in the vernacular language, not in Latin, pp. 147-159.

[Colmeiro, *Hist. de la Ec. Pol. en España*, ii., pp. 333-334.] E. Ca.

MONDAYLAND. See Lundinarium.

MONEDA FORERA, a poll tax levied first every seven and then every five years, by the kings of Castile, and paid as an acknowledgment of their royal prerogative. In time of financial distress the *Cortes* often granted at once three, five, or more *monedas*. E. Ca.

MONEDA, Pedidos, or Servicios (*Peita* or *Pecha* in Aragon), are the names given to the extraordinary subsidies voted by the *Cortes* of Castile. They were apportioned, but in a very irregular way, amongst the inhabitants according to their presumed means; it was considered by some towns a valuable privilege to be exempted from them by their *fueros* or charters. It was officially admitted that "they yielded little and left the fields untilled"; still many of them became permanent, under the name of *servicios ordinarios*. Noblemen and the clergy were exempted from the *servicios ordinarios*.

[Canga Arguelles, *Diccionario de la Hacienda* (London, 1826).] E. Ca.

MONEDAGE, a general tax levied in Aragon on all movable and real property. Knights were the only persons exempted from *monedage*. E. Ca.

MONETARY CONFERENCES (International). Four times in recent history the leading powers of the western world have met together by diplomatic arrangement to confer on monetary problems. These four great conferences, known as International Monetary Conferences, *par excellence*, were held at Paris in 1867, 1878, 1881, and the fourth in 1892 at Brussels. International conferences on monetary questions are, however, not restricted to these. The German states before the foundation of the empire, Germany and Austria, the Scandinavian kingdoms, the papal states, and the countries of the Latin Union, have held many monetary conferences of an international character, but only the four great conferences, in each of which over twelve countries were represented, are included in the scope of this article.

France and the countries of the Latin union enjoyed the privilege of a certain reciprocity in monetary policy, and the benefits of a common monetary unit many years before the formation of the Latin union in December 1865. The men who were instrumental in bringing about the union entertained bright dreams of the possibility of an international union of much greater dimensions, and of the establishment of an international money based on a common unit of value and standard of weight and fineness. The success attending French efforts in outlining the policy of the Latin union led her government to undertake the greater task of relieving the commerce of the world of the difficulties and inconveniences of international exchange. Hence France sent out invitations to all the powers to join her in a conference to this end to be held in Paris, June 17th, 1867. Previously France had, through diplomatic correspondence, submitted copies of the Latin union treaty to the powers, and called special attention to the clause whereby other states might be admitted, and asked at the same time for a statement and discussion of the objection that any state might have to becoming a party to this compact. The idea at the basis of the conference called was in reality the extension of the treaty of 1865, though the invitations stated that "the commissioners will assemble without any programme arranged in anticipation—(and)—the conference proposed has not otherwise any immediate object than to call

out an interchange of views and discussion of principles; in a word to seek for the bases of ulterior negotiations."

Representatives of eighteen of the principal countries of Europe, and the United States of America, assembled under the presidency of the French minister of foreign affairs, and subsequently under that of the vice-president of the conference, the distinguished writer on money, M. de PARIEU, who at that time was vice-president of the French Council of State. Eight sessions in all were held, and the whole discussion centred in the question of uniformity of coinage. Few signs were visible of the "battle of the standards," "the future of silver," "bimetallism," etc., and similar questions which have been the all-absorbing topics of subsequent conferences. Following the order of topics arranged by an international committee, able and dignified discussion was given to all difficulties which might arise from any attempt to unify the coinage of different nations. The U.S. expressed itself willing to coin a gold dollar and its multiples, equal in weight and fineness to 25 frs., and urged France to issue a coin of this value, and England to reduce the sovereign to the value of 25 frs., and change its fineness from $\frac{11}{12}$ to $\frac{9}{10}$ fine. The cost and difficulty of re-coinage was thoroughly discussed, and the commissioners soon gave up any idea that may have been entertained of applying uniformity to any other than gold coins of which there seemed to be a relative scarcity, but which the majority of the countries seemed determined to introduce as soon as possible.

The first decision reached by the conference was that the cost to the several nations of adapting their coinage systems to some known and existing system would be less than in the case of the adoption of an entirely new system, and that under existing circumstances the Latin union treaty of 1865 offered the best basis for a general agreement. Secondly, gold was declared to be the only standard suited to international money; Prussia, the most important silver-standard country represented at the conference, voted also for gold, it being agreed that some time might be necessary in which a transitional silver or double standard would obtain in silver-standard countries. The Netherlands was the only country to vote against the gold standard. It is interesting to note that Mr. Ruggles, the representative of the United States, declared emphatically that the United States had the gold standard, though the double standard existed legislatively but had been virtually abolished in practice. A scarcity of gold was, however, feared, and a resolution was adopted to the effect that "in countries that have had the silver standard up to this time, as well as in those of the double standard, that the relation between the value of gold and silver should not be established at a rate too low to permit the serious introduction of gold." It is significant that Prussia voted "no" on this resolution, and the United States refused to vote.

Additional dignity and importance was attached to the conference by the Emperor of France deputing Prince Jerome Napoleon to preside over the sessions after the fourth session, and the fact that the Prince emphasised in strong language the chief aim of the conference and the hope that practical results in the shape of international diplomatic treaties on the subject would be accomplished. So positive a statement rather frightened the English delegates, and Sir Rivers Wilson reminded the president of the purely deliberative character of the proceedings according to the terms of the invitation, and further declared that England would occupy a very independent position with respect to changing her system of monetary units, weights, and standard to conform to any continental system.

The question of desirable fineness was readily settled at $\frac{9}{10}$ standard, and a unanimous vote declared that "there should be types with a common denominator for weights in gold coins of identical fineness." The five-franc piece was adopted as the common denominator, although a larger unit (*e.g.* ten francs), met with some favour in the discussion, and England and Sweden voted against the five-franc piece. It was further agreed that gold coins, with the common denominator of five francs, should have legal circulation in the states mutually bound by the monetary treaties. The twenty-five franc piece was added to the list of coins, though the fifteen franc piece, intended to harmonise with existing coinage in Holland and in South Germany, was rejected by a close vote.

With this the labours of the conference practically ended. The delegates supposed that they had found the basis of a fixed and fundamental international system of money in adopting the gold standard, coins of equal weight and fineness, and divided according to the decimal system with the five-franc piece as a unit. Such understanding applied only to gold coins: each state was to remain free to coin silver for change in any way it pleased.

France agreed to assume responsibility for re-convening the conference if further negotiation was necessary after replies had been received from the various governments upon receipt of the proceedings of the present one; an answer was requested on or before 15th February 1868. England favoured a much longer period of delay, and several other countries preferred some extension of the time to permit the question involved being discussed in their respective legislatures. The conference adjourned with buoyant hopes of success on 6th July 1867, but the results of its labours never met with a sufficiently successful response on the part of the powers to warrant a re-convening of the conference.

Certainly no more praiseworthy, prudent, and intelligent effort to bring about uniform coinage has ever been made, but it merely demonstrated that any such uniformity among nations, differing widely in habits and customs, cannot be secured at one blow, but must come, if ever, as the result of a very gradual evolutionary process.

The second international monetary conference was called by the United States of America in pursuance of an act of congress dated 28th February 1878, which directed the President to invite the governments of Europe to join in a "conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bimetallic money, and securing fixity of relative value between those two metals." Faith in international bimetallism as a remedy for monetary evils had gained ground since 1867. The silver production of the U.S. had attained immense proportions, and had secured as an industry great political influence in congress. The U.S. silver commission had made an elaborate report in 1876. Germany was well established on a gold basis, and German silver had disturbed the market and threatened greater depreciation. Some form of international bimetallism seemed feasible, and the question of ratio, it was thought, was the great obstacle which a conference might settle. The conference met in Paris, 16th August 1878. Twelve countries were represented. Germany alone of the great powers declined to participate.

The United States submitted two propositions: —(1) "It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary, the assembly believe that it is desirable that the unrestricted coinage of silver, and its use as money of unlimited legal tender, should be retained where they exist, and, as far as practicable, restored where they have ceased to exist." (2) "The use of both gold and silver as unlimited legal tender money may be safely adopted: first, by equalising them at a relation to be fixed by international agreement; and secondly, by granting to each metal at the relation fixed equal terms of coinage, making no discrimination between them."

These propositions were discussed at great length, and much documentary evidence was presented, from several countries, bearing on their coinage and their attitude towards silver. The collective answers of the European powers, with the exception of Italy, to the propositions of the United States were presented at the seventh and last session, 29th August, in the following form:— "The delegates of the European states represented in the conference, having maturely considered the proposals of the representatives of the United States, recognise (1) that it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but that the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each state or group of states. (2) That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states, according to the particular circumstances in which they may find themselves placed; and the more so, in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries. (3) That the differences of opinion which have appeared, and the fact that even some of the states which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals." The delegates of the United States, in replying to these answers, stated that they had come to the conference expressly to enter into a mutual engagement for the free coinage of silver, and that the failure of attaining any practical results did not rest with them. The Italian delegates maintained that the conference "in systematically avoiding to pronounce itself upon the possibility or impossibility of a fixed relation, to be established by way of international treaty, between coins of gold and silver, leaves its task unfinished." They further claimed that the French ratio could be maintained by France, England, and the United States.

The third international monetary conference was convened by joint action of the French and American governments, "to examine and adopt, for the purpose of submitting the same to the governments represented, a plan and a system for the establishment of the use of gold and silver as bi-metallic money according to a settled relative value between those metals." The conference met at Paris in July 1881, and held thirteen sessions.

Nineteen countries were represented. At the close the following declaration was made in the name of the French and American governments:—"(1) That the depreciation and great fluctuations in the value of silver relatively to gold are injurious to commerce and to the general prosperity, and the establishment of a fixed ratio of value between them would produce the most important benefits to the commerce of the world. (2) That a bi-metallic convention entered into by an important group of states for the free coinage of both silver and gold at a fixed ratio and with full legal-tender faculty, would cause and maintain a stability in the relative value of the two metals suitable to the interests and requirements of commerce. (3) That a convention which should include England, France, Germany, and the United States, with the concurrence of other states, which this combination would assure, would be adequate to produce and maintain throughout the commercial world the relation between the two metals that such convention should adopt. (4) That any ratio now, or lately, in use by any commercial nation, if so adopted, could be maintained, but that the adoption of the ratio $15\frac{1}{2}$ to 1 would accomplish the object with less disturbance to existing monetary systems than any other ratio."

This declaration met with outspoken opposition especially from Mr. Forsell of Sweden, who said that it was better to acknowledge at once that bimetallism had collapsed, and that the resolutions of the European delegates at the conference of 1878 should be re-affirmed. The conference adjourned to 12th April 1882, to give time for further instructions from the several governments and scope to diplomatic negotiations, but was never reconvened.

At the international exhibition of 1889 at Paris, an attempt was made to organise a monetary conference. A number of sessions were held and many eminent persons took part. The report of the discussions can be found in the general reports of the exhibition. This conference, however, is rarely mentioned as one of the international conferences, because no official importance was attached to its proceedings, and its delegates were not appointed directly by their respective governments for this purpose.

The fourth international conference was called by the United States "for the purpose of conferring as to what measure, if any, can be taken to increase the use of silver as money in the currency systems of nations." It met at Brussels, 22nd November 1892, and held ten sessions, adjourning 20th December to meet 30th May 1893. Twenty countries were represented. As the United States called the conference, it was expected that the American government would have some definite plan to present for securing the end in view—an increase in the use of silver. The instructions to the American delegates were extremely vague, simply saying that they should do all in their power to "bring about a stable relation between gold and silver . . . (and) to secure, if possible, an agreement among the chief commercial countries of the world looking to international bimetallism . . . (and) failing to secure international bimetallism . . . to secure some action upon the part of European countries looking to a large use of silver as currency, in order to put an end to the further depreciation of that metal." After some delay at the beginning of the conference, the representatives of other countries refusing to express any opinions until the United States presented a plan, the following general declaration was made on the part of the United States delegation:

1. That the re-establishment and maintenance of a fixed parity between gold and silver, and the continued use of both as coined money of full debt-paying power, would be productive of important benefits to the world.

2. That these ends can be accomplished by removing the legal restrictions which now exist on the coinage of silver into full legal tender-money, and restoring by international agreement the parity of value between the metals which existed prior to 1873 at such ratio as may be decided upon by this conference.

3. That the essential provisions of such an international agreement should be

1. Unrestricted coinage of both gold and silver into money of full debt-paying power.
2. Fixing the ratio in coinage between the two metals.
3. Establishing a uniform charge (if any) to the public for the manufacture of gold and silver coins.

The discussion of this programme, which was so general and contained nothing but a re-statement of the old bimetallic position, soon proved futile and destined to come to nought. The American delegates said that the complications arising from their ignorance of the public law of the different European countries made it impossible for them to outline a more detailed scheme except after much discussion on the part of the conference. They called attention to a plan which had been proposed at the conference of 1881 by M. Moritz Levy to withdraw gold coins and notes of less value than 20 francs, and that of Adolph Soetbeer which was published in the *Hamburgische Börsenhalle* for 23rd August 1892, and in the *Neue Freie Presse*, Vienna, 20th September 1892, shortly prior to Dr. Soetbeer's death. Dr. Soetbeer proposed:

1. The acknowledgment of a fixed weight of pure gold as a universal basis for currency.

2. Recoining all gold and issuing no gold coins of less than 5·8065 grammes of pure gold (= 20 francs or $3,96) at mint charges of 2 per thousand (= $\frac{2}{10}$ of 1 per cent) and agreement to withdraw from circulation all smaller gold coins within a period of ten years.

3. Issue of gold certificates for gold deposits in amounts, or multiples, of 500 grammes of pure gold, upon actual deposits of coin.

4. Retirement of all paper money representing less than the value of 5·8065 grammes pure gold and to issue no more.

5. Retirement within fifteen years of all silver coins current with a value of more than 10 per cent of the fixed minimum gold coin, and coining major silver coins to be receivable for all public dues by the country issuing them, to any amount, at the ratio of 20 to 1; to be legal tender to thrice the amount of lowest gold coin; coinage only on government account.

6. Subsidiary silver coins to be issued as each country may determine.

7. Silver certificates to be issued only against actual deposits of major silver coins, in denominations of half the smallest gold coin or any multiple.

8. Mutual reports of laws and operations to be exchanged annually.

9. Withdrawal from compact only upon one year's notice.

These two propositions, together with that of Baron Alfred de Rothschild, for the establishment of a union of the governments represented, into a syndicate which should guarantee the purchase of £5,000,000 sterling worth of silver annually for five years, provided the price did not go up beyond 43 pence per ounce standard, and also provided the United States government continued its purchases of 54,000,000 of ounces yearly,

received the chief share of attention at the conference. Suggestions, looking to the withdrawal from circulation of small notes and small gold coins in order to force more silver into use and the issue of silver certificates on bars, and schemes requiring privileged banks of issue to hold silver as well as gold reserves, had been made at the conference of 1881 but had attracted little attention. The discussion of such measures, looking to the increased use of silver, but maintaining strictly the gold standard, was the characteristic feature of the Brussels conference. The plans already mentioned, as well as others made by M. Tietgen, Sir Wm. Houldsworth, M. Allard, M. de Foville, M. Forsell, M. M. Levi, and M. Sainctelette, were referred to a special committee of twelve, which made two reports, in one of which the plan of M. Moritz Levy was favourably recommended. The president of the conference declared that he found it impossible to keep the ensuing discussion to the subject before the conference, namely, the report of the committee; it would expand in all cases to a discussion of the general principles of bimetallism. It was therefore agreed that the simple proposition of the United States, respecting bimetallism, be taken up. Long discourses followed; that of Senator Jones of the United States, which covers 100 folio pages of the *Procès-verbaux*, going into the greatest detail. A few sessions of aimless general discussion sufficed to show that no agreement could be reached between the advocates of the single and double standard. The usual statements that the other countries must wait for England to take the initiative in a bimetallic union were made, and the usual device, adjournment for further advice from the several governments, was followed. The conference adjourned, to meet 30th May 1893, but was never re-convened. The debates of this last conference were less original and of less value than those of any of the preceding ones. The questions discussed had become firmly rooted in the politics of the various countries, and the discussion was consequently less free and untrammelled. The specific propositions for temporary, if not permanent, relief of generally admitted congested monetary symptoms, which to some extent distinguished the Brussels conference from its predecessors, can hardly be said to have received the discussion and adequate consideration they deserved, so intense was the feeling on the general bimetallic controversy.

Since the adjournment of the Brussels conference the parliaments of England and Germany were both compelled by strong political pressure to pass resolutions (House of Commons, Res. 26th February 1895, German Reichstag, Res. 16th February 1895) favouring another conference, and the congress of the United States, just previous to its recent adjournment, passed a resolution (3rd March 1895) providing for the appointment of delegates should a new conference be called. Later (July 1895), all interested parties were looking to the chancellor of the German empire to take the initiative in calling another conference, but he did not relish the responsibility, being disinclined to take action until forced to do so by the agrarian-bimetallic party in Germany. On 17th March 1896, the House of Commons agreed to a resolution urging on "the Government the advisability of doing all in their power to secure by international agreement a stable monetary par of exchange between gold and silver." No immediate action however appears likely to follow.

[The official proceedings of the various conferences have been published in the French language under the general title *Conférence Monétaire Internationale*, Procès-verbaux. The dates of these publications are as follows:

S. M'C. L.

MONEY. The term "money" is applied to any commodity, whatever its substance or its form, which, whether by law or by convention, becomes the common medium of exchange in any community. The difficulties of BARTER or TRUCK, that is of direct exchange, are so great that subdivision of labour and diversification of industry can be carried but a very little way under such a system. Tribes in no very advanced stage feel the need of a common medium of exchange; hence, the history of money is almost co-extensive with the history of mankind beyond the purely savage state. Oxen were used as money among the Greeks of the Homeric period. Sheep served the Italians

at a later period, as the common medium of exchange. After the abandonment of Britain by the Romans, we find the inhabitants, in the scarcity of coin, returning to the use of "living money," especially in Scotland and Wales. "It is very possible," says Sir Henry Maine, "that kine were first exclusively valued for their flesh and milk; but it is clear that, in very early times, a distinct and special importance belonged to them as the instrument or medium of exchange." Cattle and sheep may be a good money or an inconvenient money, according to the circumstances of the community. In a pastoral state they present many advantages. They carry themselves, and thus avoid one of the objections to the employment of grain. The opportunities for grazing which everywhere exist, and the familiarity of all persons with guarding and tending animals, reduce the trouble and risk of using them. On the other hand, cattle and sheep have two serious drawbacks as money. The first is, that each animal represents too large an expenditure of labour to answer in small purchases. Even calves and lambs scarcely meet the requirements of "change." The second drawback is, want of uniformity in quality. Even in a picked herd or flock there is great room for choice. If goods are sold for cattle or sheep, the buyers will pay in the smallest and lankiest specimens to be found. This was the experience of the Massachusetts colony so long as cattle were received in payment of taxes. If such disadvantages attend the use of "living money" even in a pastoral state, the cost of keeping them and the risk and trouble which attend their nurture and custody in any highly civilised state are so great as absolutely to preclude their use. Of the cereals, wheat, corn, and rye have extensively fulfilled this office. These and other grains have two important qualifications for such use: (1) the being in universal request for consumption as food; and (2) in allowing almost indefinite subdivision. But they are subject to two serious drawbacks: (1) in the great weight of a quantity which represents a day's labour; and (2) through their liability to deterioration from rust, insects, excessive moisture, undue heating, or the mere passage of time.

The literature of travel is full of stories regarding the rice money of the Coromandel shore, the cacao money of the aboriginal Mexicans, the oil money of the Ionian islands, the rock-salt money of Abyssinia, the wampum money of the early New Englanders, the tobacco money of Maryland and Virginia in the same period, the tea money of the Russian fairs, the date money of the African oases, the beaver and sealskin money of many northern countries, and a host of other commodities adopted, in one place or another, for meeting the requirements of a common medium of exchange. One great class of substances have a peculiar importance in the history of money, from the earliest times and amid a wide circle of nations. The metals, especially seven of them, have been found to possess in a high degree the material properties required. Iron, lead, tin, and copper, one or another, early became the money of most of the countries whose history is known. The money of Lacedæmon was of iron; and this metal, at least until recent times, served the inhabitants of Senegambia; Sweden, when impoverished by the wars of Charles XII., went back to the use of Copper Money (*q.v.*). Lead was extensively employed in exchange by the early Romans and the early English; and is still given and taken in Burmah in small payments. Tin was used by the Mexicans as money, even after silver and gold were known. It was long so employed in Sweden; and more recently served in that capacity among the Chinese, along the shores of the Malay peninsula, and in Prince of Wales' Island. Of the four metals named, however, copper has the greatest importance in the history of money. From its higher cost of production it superseded iron when that metal came, in the development of mining industry, to possess a value for its bulk unsuited to the uses of exchange; while yet silver was too precious for the ordinary transactions of daily life. During the silver famine of the middle ages, copper came back to be the principal money of the people of Europe. The employment of copper in a diminishing degree has continued in Europe and America nearly down to our own day; but this metal, or recently the closely allied bronze, has now sunk in all civilised states to the rank of "token-money," or change. Over no small part of the world, however, it is still an important element in the monetary circulation. We have now to speak of a fifth metal. Between 1828 and 1845 the emperor of Russia sought to bring platinum into use as a money metal; but the effort failed, owing to the extreme difficulty of rendering that metal from ingots into coin, and from coin into ingots, as the exigencies of exchange might require.

Of all the metals, two have enjoyed a pre-eminence in the history of money which has given them the name of the Precious Metals. Not that they are the most costly. Several are more valuable even than gold; but this is true only of metals found in extremely limited quantity, like iridium or venadium, far below the requirements of a general medium of exchange. Of the two precious metals, silver was first used as money. We read of it in early Hebrew history. It was long coined by the Greeks and Romans, while gold remained merely treasure, devoted to regal and sacerdotal

uses. The extreme beauty of silver, with its numerous applications to the economy of life, make it an object of admiration and desire among people of all degrees of social advancement. Easily fusible, highly ductile, nearly imperishable, silver would have filled our utmost conception of a money-metal did not the earth yield one transcendent product, in comparison with which even silver fades from desire. "The compendious value of gold," to use Mr. Jacob's expression, allowing a vast amount of purchasing power to be concentrated for conveyance or concealment in little bulk; its durability, its fusibility, ductility, and malleability, properties of the highest importance for the purposes of coinage and circulation, and its numerous uses in the industrial and decorative arts,—all these combine to make it chief of money-metals.

The foregoing are among the articles which have served the world in one stage or another of social advancement, as the common medium of exchange. It is of the essence of money that all persons who have anything to sell shall take it as a matter of course. The extensive use of an article in exchange does not necessarily make it money. Those transactions, however numerous and important, may be nothing but acts of barter. So long as men take an article in exchange, having any great degree of uncertainty as to their finding a person who will take it from them; so long as men accept it with the feeling that it is something which they are buying, and which they will have to sell over again, something for which they must needs hunt up a purchaser, that article is not money. Anything to be money must have acceptability so nearly universal that practically every person who has any product or service to dispose of will freely take it, in preference to seeking, at the time, the specific products or services which he may require from others, since he is fully assured that with this thing, money, he can, at times and in form and in amount to suit his immediate necessities, obtain what he shall desire. Each person, thus, whatever his place in the industrial order, accepts money without reference either to his own need to consume any of the particular article so used, or to the character or the credit of the person who offers it. When he has anything to sell, he takes money from any man, because he knows that any other man will take it from him whenever he wishes in his turn to buy. If an article reaches this degree of acceptability, it becomes money, no matter what it is made of or why people want it. The carved pebbles formerly used by the Ethiopians, the wampum which circulated in the 17th century between the New England colonists and the natives, the glass beads used along the Arabian Gulf, the shells and red feathers employed throughout the isles of the Indian Ocean, were all money, though capable of serving no purpose but that of ornament and decoration.

We have thus far spoken of the principal, the characteristic function of money, namely, that of the common medium of exchange. This is the distinguishing office of money. Whatever does this is money. But incidentally, money performs another important service to exchange, namely, by furnishing a price-list, or price-current, of all articles in the market. Since these are, by turns, exchanged for money, each is expressed in terms of money; and, in consequence, all can at once and readily be compared among themselves as to value. The value of any article in terms of money is called its PRICE. The foregoing office of money has been termed by economists generally that of a measure of value; but that term is not descriptive, and has proved highly misleading. A better statement would be that money in this connection fulfils the office of the common denominator in exchange, or denominator of values (see DENOMINATOR, COMMON). The numerators consist of the prices of the several articles in the market; and, inasmuch as the denominator is common to all, these can readily be compared among themselves. Some economists have made the mistake of speaking of this as an independent, and even as the principal office of money. Thus, Mr. Mill says that "the first and most obvious" of the inconveniences of doing without money would be "the want of a common measure of values": and Prof. Francis Bowen says, "We can do without money as a medium of exchange, and can even barter commodities for other commodities without the use of any medium. But we cannot do without money as a common standard or measure of value." Even Prof. Jevons writes as if one article might serve as a medium of exchange, while another might serve as a measure of value, in the same community. But it ought to be perfectly evident on a moment's reflection that it is only by, and through, an article being used as the common medium of exchange, that we obtain the prices which make up the price-list or price-current. Consequently, if we did without money as the medium of exchange, we should perforce have to do without it as the denominator of values. Having thus seen the two ways in which money, even in societies but a little advanced industrially and commercially, facilitates exchange, allowing the division of labour to be carried out to its economic maximum, time and place considered, we are prepared to make a better statement than that yet offered regarding the primitive function of money; and we say that money serves as the common medium of exchange: (*a*) dispensing with "the double coincidence of wants and of possessions," to use the phrase of

Prof. Jevons, which is involved in direct exchange; (*b*) furnishing a price-current of all commodities in the market.

Regarding the philosophy of money in its uses thus far described, there is practically no difference of opinion among economists of standing. The value of money is admitted by all to be governed by the operation of the ordinary law of demand and supply. There being—in any community, at any time, according to the state of the arts and according to the extent to which the division of labour has been carried,—an economic need or demand for a certain amount of money-work to be done, in carrying commodities from producers to consumers, the quantity of the money-thing which is available to do that work will determine its value. If shells constitute the money of a community living by the sea, then, if there be much exchanging to be done, that is, if there be a large demand for shells to effect exchanges, and if shells be scarce, each shell will have a high value. Prices will be correspondingly low, that is, a large amount of commodities will sell for but few shells. If the supply of shells be suddenly increased, as by a great storm bringing them up on to the shore, the value of shells will fall; that is, prices will rise. The relation of the value of primitive money to cost of production is, with a single exception to be hereafter noted, the same as in the case of any commodity not used as money. If the cost of production of that which serves as money is diminished, as by improvements in an art or by the discovery of new resources in nature, the supply will be increased, and its value will fall in consequence, that is, prices will rise. If the cost of production of that which serves as money is increased, as by the exhaustion of natural resources, its supply will fall off; its value, demand remaining constant, will be enhanced, that is, prices will fall. The exception above referred to is that noted by Mr. Mill, namely, that, while a prospective increase or decrease of supply, in the case of any commodity not used as money, generally results in its price falling or rising without awaiting the marketing of the new supply, the value of money only changes—demand being all along assumed constant—with the actual changes of supply, inasmuch as prices are the result of real exchanges of commodities for money.

Having thus stated the law of primitive money, let us now proceed to observe the action of money in societies industrially and commercially advanced, and into which credit enters. In such societies, goods are not always exchanged for money at the time; an equivalent is not always or perhaps habitually given on the spot. Future payment is often stipulated for; and a new money-function appears, that of the standard of deferred payments. We are thus able to give a full and final definition of money, namely, that it is that which serves (1) as the common medium of exchange, (*a*) dispensing with the double coincidence of wants and of possessions involved in barter; (*b*) furnishing a price-current of all the commodities in the market. (2) As the standard of deferred payments. To put it in another form, money is that which passes freely from hand to hand, in full payment for goods, in final discharge of indebtedness, being accepted equally without reference to the character or credit of the person tendering it, and without the intention on the part of the person receiving it himself, to consume or enjoy, or otherwise use it than by passing it on, sooner or later, in exchange.

The introduction of credit into the commercial and industrial society, devolving upon money the additional function of a standard of deferred payments, has hindered the unanimous concurrence of economists as to what money exactly is, and as to what money exactly does. The use of credit instruments, the introduction of bills of exchange, drafts, and cheques, and the accumulation of deposits in banks, introduce an element into the philosophy of money which it is difficult to resolve to the satisfaction of all thinkers and writers. Some insist on regarding every form and instrument of credit as a part of the monetary circulation; some on treating bills of exchange and bank deposits, at any rate, in this way; others, still, regard bank deposits, at the least, as money, since cheques are freely drawn on these for the discharge of indebtedness. Lord Overstone (see Jones Loyd) may be regarded as the leader of the school of writers who classify bank deposits as money. Prof. Sidgwick holds the same view, and would alter the definition given above by substituting the words "from owner to owner," in place of the words "from hand to hand." A great deal is to be said on either side of this question, and there is no present reason to suppose that a general agreement on the subject can be reached. The writer contents himself with presenting his own reasons for holding that credit instruments generally, viz. bank accounts, bills of exchange, and cheques drawn on deposits in bank, should be excluded from the category of money.

These reasons are as follows:—Let us revert for a moment to the primitive condition of industry and trade, before credit has been introduced. Money serves here as the general medium of exchange; yet barter may in many instances be resorted to. These acts of direct exchange reduce, to that extent, the field for the operation of money. They diminish, by just so much, the money work to be done, and by consequence, the demand for money. But no one looks on them as a part of the money supply; no one regards acts of barter as in any sense constituting a use of money. In an

advanced industrial and commercial state, credit limits the field for the operation of money, as barter did in a primitive state. The mutual cancellation of indebtedness, which the introduction of credit effects through the use of book accounts, bank deposits, etc., withdraws a certain, it may be a vast, body of exchange transactions from the field in which money operates; but within that field, thus reduced, money does its work in precisely the same way, and as completely under the ordinary law of supply and demand (see DEMAND; SUPPLY AND DEMAND) as, in the primitive state, money did its work within the field of exchanges which had been diminished by barter. After all that credit can do in the mutual cancellation of indebtedness, there still remains, in the community most highly advanced, even where banking has been carried to its utmost limits, a vast volume of transactions which must be effected by the use of money. The sufficient proof that these must be effected by the use of money is found in the fact that they are so effected, for money would not be used, since its use involves expense, unless this were economically necessary. Money being thus necessarily employed over a vast field of exchange transactions, after all the efficiency of credit is exhausted, the value of money within that field is determined precisely as it was determined before credit was introduced. There being a certain quantity of the money-work to be done, the quantity of the money-thing available to do that work fixes its value. If there be more of it, its value will fall and prices will rise. If there be less of it, its value will rise and prices will fall. The exchange transactions which, in the result, are cancelled by the use of credit, simply diminish by so much the field in which money would otherwise operate. In this respect they correspond exactly to acts of barter in primitive communities. It is true that if the quantity of money be diminished and its value in consequence rises, there will be an economic effort to expand the range of the mutual cancellation of indebtedness, since, as was said, the use of money always involves a certain expense; while, if the quantity of money be increased, there will be a tendency to relax efforts to secure the widest possible cancellation of indebtedness, and in consequence, a larger body of exchange transactions will involve the use of money. But it remains true that, however the field in which money operates may be broadened or narrowed by such a cause, it is that field which determines the amount of money-work to be done, that is, the demand for money; while the supply of money will be in nowise affected except as its higher or lower value at the time may stimulate or retard its production.

But it may be asked, if bills of exchange and bank deposits are not to be treated as money, shall bank notes be so regarded? We may answer, "Yes." Bank notes do the money-work and are therefore the money-thing. When issued by institutions of undoubted solvency, they pass freely from hand to hand, in full payment for goods, in final discharge of indebtedness, leaving no trace of their course, such as cheques and bills of exchange do through successive endorsements. They are accepted without reference to the character or the credit of the person who offers them, except solely as the bad character of that person might require more scrutiny to ascertain that the notes were genuine. His mind satisfied on that point, whoever has sold goods receives the notes of solvent banks precisely as he would receive gold or silver coin, even though the man offering them were a well-known rogue. Bank notes are, therefore, in every sense, money. Bills of exchange and bank deposits are merely instruments for the mutual cancellation of indebtedness, and are not money.

We have thus passed through the entire extent of the functions of money, dwelling long enough upon each to be able to see what money is and what money does. In order to anticipate objections and to resolve doubtful cases, it is, however, desirable to speak more at length of each of these functions by turns. And, first, of the medium of exchange, that is, of money as dispensing with the double coincidence of wants and of possessions, implied in barter. It will be observed that every use of money involves a double transaction. Instead of commodities being exchanged directly for each other, each in its turn is sold for money; and the commodity desired is purchased with that money. There are, thus, two transactions in place of one; but, as the acceptance of money is universal and a matter of course, those two transactions involve less, probably far less, possibly almost indefinitely less, effort than would direct-exchange, where it is essential to find some one who not only wants what you have, but has what you want. In order to secure and maintain the universal acceptability of money, it is, in primitive societies, necessary that the article adopted for this use shall be some material thing, having intrinsic properties which make it an object of general desire for its own sake. When, however, we advance to contemplate highly civilised societies, we find them sometimes using as money an article whose value depends entirely on convention or law. Bank notes are not things useful in themselves; while the difference between a bank note for five, and a bank note for ten pounds exists only in the substitution of one arbitrary symbol for another. Mutual confidence or legal authority entering, it ceases to be essential, however desirable it may continue to be, that the article used as money shall be something having useful properties. The

savage builds his canoe of materials every part of which will float of itself; the civilised man constructs his ship out of materials every part of which by itself would sink to the bottom. The difference between savage money and civilised money is not less remarkable. It is universal confidence or universal respect for law which enables modern societies to substitute for that "material equivalent or recompense,"—to use the phrase of M. CHEVALIER —which is the characteristic of all primitive moneys, a money of mere convention, like bank notes or government paper. Yet for the same reason the possibility of a serious catastrophe always attaches to such money. If confidence fails, if the *fiat* of government is carried beyond the limits of obedience, the acceptability of the money may gradually or abruptly cease (see FIAT MONEY); and an industrial and commercial system which has been built up on the basis of such a monetary circulation may be shattered or brought to ruin. A view of these evil possibilities attending all money into which credit enters, or to which mutual confidence is essential, has caused many excellent writers, especially in America, to deny the name money to anything which is not a "material equivalent or recompense," and especially to government issues. These writers make the mistake of saying that government paper is not money, when they really mean to say that it is bad money. Now, wholly in addition to the distinction between money and not-money, we have the distinction between good money and bad money. Anything is money which does the money-work, even though it does this with less of convenience and with more of danger than would some other thing. During the paper-money period of the United States, namely, from 1863 to 1879, "greenbacks" unquestionably performed all the offices of money. They circulated with the utmost freedom; they were cheerfully and even eagerly received; men worked for them or gave goods for them, without challenge or question; they furnished a "price current" as clear and intelligible as ever did gold in such use; they were, with the single exception of the distant and isolated communities on the Pacific coast, the standard of deferred payments universally employed. Therefore, greenbacks were money. At the same time, being in excess, they inflated prices, excited to speculation, kept industry and trade in a state of agitation, and caused a continual transfer of wealth from the productive to the speculative classes. They were, therefore, bad money.

Money of mere convention has liability to two evils. The first is, that not being a "material equivalent or recompense," it is subject to be issued in excess. Especially is this true of paper put out directly by the government. Not the wants of trade, but the exigencies of the treasury, are apt to determine the amount of issues; and whenever such issues take place in excess of the wants of trade, they almost inevitably go from bad to worse. Prices become inflated, speculation sets in, and there is often both a popular and a fiscal demand for still larger issues, to sustain the inflated prices (see ASSIGNAT; BULLION COMMITTEE, REPORT OF; INCONVERTIBLE CURRENCY). Yet there are historical instances of such money being issued and maintained without excess, or, at any rate, marked excess, through the exceptional prudence and moral courage of legislators or fiscal authorities. On the other hand, as in France after the war of 1870, the natural or material forms of money cannot be increased arbitrarily. Being products of labour, they can only be increased by the application of corresponding amounts of labour to their production. They have in this a safeguard against excess which is lacking in all moneys of mere convention. The second evil liability of money of convention arises from the fact that the force of such convention has its territorial limits, whether those of a small community or those of a large state. Owing its acceptance to convention within those limits, any local excess cannot be reduced by exportation. Such money has no natural drainage. Wherever it is poured out, it makes a swamp. On the other hand, the material forms of money are subject to exportation to communities which have no respect for local convention other than their own, but which have personal or social wants that may be satisfied by the intrinsic properties of these articles. The exportability of money reaches its highest point in the case of gold and silver. The demand for these metals being universal, any local excess anywhere is at once drained off; and each community retains only so much as is required to keep its own prices on a level, cost of transportation being taken into account, with prices in the countries with which it trades. The beneficial influence of this on commerce, and in the second degree upon production, cannot be over-estimated. It is, indeed, almost essential to the maintenance of the vast system of modern production. During the paper-money period of the United States already referred to, prices, owing to the non-exportability of the GREENBACK, were out of all relation to the general prices of commerce. The exporter sold his goods for gold, and then sold the gold for whatever it would bring at the time, in the local money. Trade, and in consequence, production, became highly speculative, with the most mischievous results to the industry of the country, not to speak of grave social and political evils.

But, even in cases where, through exceptional prudence and courage on the part of the government, paper is not issued in excess, very

considerable evils may yet be produced by the use of such money. During the suspension of specie payments by the Bank of France, from 1871 to 1877, the premium on gold was, by the remarkable sagacity of the directors, kept at a very low figure, almost vanishing at every favourable turn of trade. Yet even this was not without momentous consequences to the commerce of that country. In his valuable work, *Lombard Street*, published at about the close of that period, Mr. Bagehot remarked:—"The note of the Bank of France has not, indeed, been depreciated enough to disorder ordinary transactions. But any depreciation, however small, even the liability to depreciation without its reality, is enough to disorder exchange transactions. They are calculated to such an extent of fineness, that the change of a decimal may be fatal, and may turn a profit into a loss. Accordingly, London has become the sole great settling house of exchange transactions in Europe, instead of being, as formerly, one of two."

Let us now consider the second function of money, that of the common denominator of values. There is no other point on which writers on money are so generally in error as here. The cause of that error is largely found in a vicious terminology. Having begun by calling money, in this relation, the measure of value, they seem to have felt themselves bound to show that money does measure values. Thus, Prof. Francis Bowen writes: "A measure must be homogeneous with the thing measured. As that which measures length or capacity must itself possess length or capacity, so that which measures value must have value in itself, or intrinsic value." . . . Prof. Thorold Rogers says: "We need some common measure of value as we need measures of length and capacity." And Mr. Mill, as referred to above, mentions among the first and most obvious wants of exchange that of "a common measure for values of different sorts." From this notion, that money measures values, has come the dictum, common to most economists, that a money of mere convention, not having INTRINSIC VALUE (*q.v.*), not being "a material recompense or equivalent," cannot perform this function, whatever it may do as the universal medium of exchange. It would appear that all this confusion has arisen from the use of a misleading term. If we read further in the works of these writers, we find that the function they are really treating of is merely that of a common denominator in exchange. Now, it is not essentially the office of a denominator in exchange to measure values; but only to express them, as measured. If we contemplate money of pure convention—for example, mere pieces of paper curiously engraved—and if we assume for such money a general acceptability, such as money of this kind has frequently possessed, and possesses to-day in many countries, a moment's reflection will show that, by being actually exchanged against these pieces of paper, all commodities in the market become measured as to their value, without regard to the cost of production of the money itself. If all producers desire these pieces of paper, and desire them very much, no matter for what reason, then all commodities which have a high cost of production, and are in corresponding demand, will exchange for many pieces of the paper, or otherwise the supply of such commodities would rapidly fall off; while commodities having a low cost of production will exchange for few pieces of paper, since, otherwise, the supply of such commodities would rapidly increase, which would at once bring down their price. In this way, that is, by the efforts of all producers to bring to market those commodities which will command the greatest number of these pieces of paper for a given expenditure of time and labour, all the commodities in the market will be differentiated as to value, exactly as if the money consisted of gold or silver. With a money of gold or silver the effort of each producer to bring to market the commodities which, for a given expenditure of time and labour, will command the greatest number of coins of a certain denomination, differentiates all commodities in the market as to value, without reference to the cost of production of the coins themselves. The action in the case of money of mere convention is identical; and the results are just as exact. By the mere fact of being exchanged for any kind of money, each commodity takes its place on the price-current, high up or low down, according to the demand for it, and according to the ease or difficulty with which it can be brought to market—that is, according to demand and supply. It is this conception of the function of money as a common denominator of values, which underlies the discussion of IDEAL MONEY by Sir James STEUART and Messrs. F. Percival ELIOT and Gloucester WILSON. These writers were far nearer the truth than their critics. Probably the history of philosophy furnishes no instance of an equally mischievous result from the use of a false terminology, with that which has followed the phrase, "measure of value," in its application to money.

Let us now speak of the remaining function of money, that of a standard of deferred payments. The emergence of this function, consequent on the development of the credit-system, lays on that which shall be used as money a requirement altogether additional to those made upon it in a state of society where all commodities are paid for at the time of delivery. In the earlier state, it would not matter much, if at all, should the article used fluctuate widely and rapidly as to its own cost of production or its own conditions of supply. But when credit is

given—that is, when payments are deferred,—it becomes at once of vast, if not supreme, importance that money shall remain reasonably stable in value, from time to time. It is here that money of mere convention displays its greatest weakness, since its quantity can be arbitrarily increased to any extent. Yet in this respect those forms of money which have "intrinsic value," which constitute "a material equivalent or recompense," fall far short of what is to be desired. Even gold and silver, which, owing to their practical indestructibility, remain highly stable in value from year to year, yet fluctuate enormously from age to age. The story of the spasmodic and often intermittent production of the precious metals has been told in other parts of this work (see GOLD AS STANDARD). So tremendous have been the consequent fluctuations in value that it has frequently been proposed to substitute CORN RENTS, in contracts for considerable terms of years; and, in a vast number of instances, rents, annuities, etc., have actually been stipulated for in bushels of wheat. The cereals, while they fluctuate far more than gold or silver from year to year, have been more stable, at least until a very recent date, through long periods of time. Even these, however, fall so far short of supplying all the conditions of a good standard of deferred payments, that it has been by many writers proposed to create a TABULAR STANDARD, or multiple tender, the nature and office of which will be found described under the title INDEX NUMBERS.

Another point which requires consideration in the philosophy of money is the effect of corruption or debasement of the coin—assuming, now, metal money to be in use—upon the value of money. There are two cases: (1) where corruption or debasement is universal, all coins being alike diminished as to weight, or impaired as to fineness; (2) where the coin has been irregularly corrupted or debased. In the latter situation, it is usual for writers on money to say that the principle known as GRESHAM'S LAW will at once begin to operate. This law, or theorem, which derives its name from Sir Thomas GRESHAM, the founder of the Royal Exchange of London, is, as commonly stated, that bad money invariably drives out good money. Thus expressed, the theorem is incorrect. Bad money will only drive out good money when the sum of the two is in excess of the wants of trade; that is, in excess of the amount which is necessary to keep prices in the community on a level, cost of transportation being taken into account, with prices in the communities with which it trades. So long as bad money and good money together only make up the amount which is needed, neither will drive the other out. RICARDO correctly states the principle in his reply to C. BOSANQUET: "It is a mistaken theory to suppose that guineas of 5 dwt. 8 gr. cannot circulate with guineas of 5 dwt., or less. As they might be in such limited quantity, that both one and the other might actually pass in currency for a value equal to 5 dwt. 10 gr., there would be no temptation to withdraw either from circulation. There would be a real profit in retaining them." It is only when the total amount of money comes to be in excess of the wants of trade, that exportation or melting of the coin begins. In such a situation, Gresham's law operates with almost absolute certainty. The exporter, or the manufacturer of gold or silver plate, selects for his purposes the coins of fullest weight or of the highest purity, thus withdrawing them from the circulation, whose average quality is in consequence reduced. This, however, goes on only so fast and so far as the total amount of money is in excess. Should the introduction of abraded or debased coin continue, all the better coins would, in time, be exported or sent to the melting pot.

In the second case of corruption or debasement of the coin, viz. where such corruption or debasement affects the whole body of coins, the effect upon the value of money constitutes one of the most difficult questions in the philosophy of this subject. The writer believes that the truth in this matter is wholly on the side of Ricardo. No matter to what extent the corruption or debasement has proceeded, coins will still pass for their full denominative value, provided only the amount issued be not excessive. Ricardo failed, probably from inadvertence, to affix a single proviso which is essential to the correctness of this statement, viz. that popular knowledge of the corruption of the coin should not create a popular indisposition to use the coin. If this were to take place, it would cause an extension of the field of barter or of the operations of credit. Such an extension of the field of barter on the one hand, and of the operations of credit on the other, would of itself constitute a reduction in the demand for coin, which would necessarily reduce its value, that is, raise prices. Ricardo is unquestionably right in saying that there are numerous historical instances of a coinage largely abraded or debased, circulating without a corresponding reduction, if not indeed without any reduction at all, from its proper denominative value. The purchasing power of money being determined wholly by the relations of demand and supply, government can, by limiting the supply, in a very large degree control the value of money. Ricardo even goes so far as to regard paper money as money upon which the SEIGNIORAGE (*q.v.*) is 100 per cent. But, while it is thus in the power of government, by controlling the supply, largely to influence the value of paper money, the economist who has a reason-

able reference to the nature of political forces can never give his approval to paper money not instantly and unconditionally convertible into coin of full value. As Alexander HAMILTON says, "paper emissions are of a nature so liable to abuse, and it may even be affirmed so certain to be abused, that the wisdom of government will be shown in never trusting itself with the use of so seductive and dangerous an expedient."

It has been said that money, while it has value, has not price, the latter term being reserved to express the value of other things in terms of money. This is true, so long as one article only is used as money. Let us, however, take the case of a community in which both gold and silver are used in this relation. Since gold and silver have separate sources of supply, and have also, in some measure, independent causes of demand, as *e.g.* for use in the arts, then we shall have a gold-price of silver, and a silver-price of gold. This is the situation which BI-METALLISM (*q.v.*) contemplates; and it is the effort of that system to extinguish all preference for either of these metals, at a ratio agreed upon, and fixed by law,—*e.g.* 15½ of silver to one of gold, as under the French law of 1803,—so that the gold-price of silver and the silver-price of gold shall remain constant.

[The literature of money is almost measureless. A complete bibliography would form a considerable volume. The first important writer on money was ARISTOTLE; and there is no stronger proof of the greatness of this early philosopher than that his conception of the money function still influences scientific thought. As European society emerged from the monetary confusion and disorders consequent on the silver famine of the middle ages, Nicole ORESME, moved by the abuses of the French coin, published in 1360 his treatise on money, a work which, after being long lost to the world, was, about 1862, discovered by the eminent German economist, ROSCHER, of Leipzig, and has since been put out by M. WOLOWSKI, in the original Latin text, with an introduction and a French translation. No work expresses more strikingly the pernicious effects of that *morbus numericus*, which wrought such misery among the people and caused such weakness in the governments of Europe, and which had afflicted France with special virulence. Oresme's treatment of the principles of coinage and seigniorage is characterised by great precision. At the beginning of the 16th century, the astronomer COPERNICUS addressed to the king of Poland his treatise *Monetæ Cudendæ Ratio*, which deals with the then universal evil of the corruption and debasement of coin. But it was Italy which made the largest of the earlier contributions to the philosophy of the subject. Mr. Stephen COLWELL remarks that this country was long noted for the worst money and the best writers on money. The coin of Italy was sunk into an abyss of discredit while BECCARIA and VERRI were expounding the true laws of monetary circulation, and the works of SCARUFFI and NERI were manuals for the mints of the continent. Among the early English writers on money, say from 1682 to 1717, the most distinguished names are those of Sir Wm. PETTY, Dudley NORTH, John LOCKE, William LOWNDES, John LAW, and Sir Isaac NEWTON. In 1730 SWIFT published his *Drapier's Letters*, concerning Wood's brass halfpence, more notable as an example of satire and invective than as a contribution to the theory of money. Shortly before the publication of Adam SMITH'S *Wealth of Nations*, Sir James STEUART'S *Enquiry into the Principles of Political Economy* dealt at length with the problem of money; and the same writer, acting for the East India Company, in 1772 wrote his treatise on the coin of Bengal. HARRIS'S essay upon money and coins (1757), belonging to this period, contains matter of historical interest. Adam SMITH'S great work (1776) did not add much to the philosophy of money. His compatriot and contemporary, David HUME, on the other hand, though in brief compass, made a contribution of no little value. The suspension of specie payments by the bank in 1797, and the long controversy which followed the bullion report of 1810, gave rise to an immense volume of literature, much of it of permanent value. The tracts and other publications of Lord KING, Sir Francis BARING, R. TORRENS, BOSANQUET, Boyd, MUSHET, Hill, VANSITTART, Fonblanque, General Craufurd, Lord LAUDERDALE, William BLAKE, Arthur YOUNG, William HUSKISSON, Francis HORNER, David RICARDO, and Henry THORNTON, are deserving the attention of every student of monetary science. The giants of this controversy were the last four. Ricardo's tracts on money perhaps occupy the highest single place in the literature of the subject. Lord LIVERPOOL'S treatise on the *Coins of the Realm* (1805) derives its chief interest from its relation to the demonetisation of silver by the English government, in 1816. Thomas and Matthias ATTWOOD were the champions of FIAT MONEY. Following the resumption of specie payments, in 1819, there came within a few years Sir Walter Scott's letters on the currency of Scotland (Malachi Malagrowther); Sir James GRAHAM'S *Coin and Currency;* Sir Henry PARNELL'S *Observations on Paper Money, Banking, and Overtrading;* SENIOR'S *Cost of Obtaining Money;* JACOB'S *Inquiry into the Production and Consumption of the Precious Metals;* and, greatest of all, Thomas TOOKE'S *Inquiry into the Currency Principle*, 1844. Tooke assumed and strongly fortified the positions regarding the operation and influence of paper money, which he afterwards assaulted with such distinguished ability in his *History of Prices.* Belonging to the next period, that, namely, between 1832 and the time of the Australia and California gold discoveries, are Poulett SCROPE'S *Examination*, etc., FULLARTON'S valuable work on *The Regulation of Currencies*, and James WILSON'S *Capital, Currency, and Banking.* Most of the economic interest of this period centred in the action of parliament regarding the Bank of England; and the report on the bank charter, in 1833, from the secret committee; and the first and second reports of the select committee upon banks of issue, 1840 and 1841, are among the most valuable blue books issued since the bullion report of 1810. Peel's act of 1844, regulating the privilege of issue, gave rise to an enormous literature. Chief among the disputants were Thomas Tooke, Lord Overstone (Samuel Jones LOYD), Colonel TORRENS, George Warde NORMAN, James W. GILBART. The chapters regarding money in Mr. Mill's great work on political economy are among the most important contributions of this time to the theory of that subject. The Californian and Australian discoveries, about 1850, produced several works of marked value, particularly William NEWMARCH'S *New Supplies of Gold*, and J. E. CAIRNES'S *Essays on the Gold Question.* Maclaren's *History of the Currency* may be mentioned. The demonetisation of silver by Germany, following the American Civil War, produced a controversial literature rarely equalled. The same period has also witnessed the publication of some important constructive works, pre-eminently Mr. BAGEHOT'S *Lombard St.*, Prof. JEVONS'S *Money and the Mechanism of Exchange*, and Mr. Goschen's *Foreign Exchanges.* Mr. Ernest SEYD published several pamphlets in favour of bi-metallism early in the course of the controversy; Mr. H. Hucks Gibbs (now Lord Aldenham), Prof. H. S. Foxwell, and Prof. J. Shield Nicholson have led in the recent discussion on the same side: while Sir Robert Giffen and Lord Farrer have upheld monometallism. The report of the commons committee of 1876, on the depreciation of silver, is of great importance.

In the United States, money or "currency" (Mr. M'Leod calls this word "a mischievous Yankeeism") has always been a favourite theme. Pelatiah WEBSTER'S *Nature and Operation of Money* (1792) is interesting and valuable. Prof. W. G. Sumner's *History of American Currency* presents much information. Accounts of the paper money issues of the several colonies have been written by FELT, PHILLIPS, Brownson, and others; and of the revolutionary paper money by J. W. Shuckers. The works of Alexander HAMILTON, Albert GALLATIN, and Daniel WEBSTER, contain much that is of value in the theory of money. Messrs. Condy Raguet and Wm. M.

Gouge were among the passionate opponents of bank money. Prof. George Tucker's *Money and Banks* is a work of merit. Stephen Colwell's *Ways and Means of Payment* contains much useful information. The theory of bank money is treated with great fulness in Prof. Amasa Walker's *Science of Wealth*. The "inflation period," 1862 to 1879, brought on extended discussions of inconvertible paper money, in which the leading participants were Henry C. Carey and H. C. Baird on the Fiat Money side; and David A. Wells and W. G. Sumner on the Hard Money side. Mr. John J. Knox's work, *United States Notes*, furnishes the most accurate account existing of the national issue of paper money. H. R. Linderman's *Money and Legal Tender* is a useful manual. Francis A. Walker's large treatise on money was published in 1878; and his smaller work, *Money, Trade, and Industry*, in 1879. Mr. S. Dana Horton is easily the most learned of the writers in favour of bi-metallism (see his *Silver Pound* and *Silver in Europe*); Prof. J. Laurence Laughlin's *Bi-metallism in the United States* is strongly monometallist in its bearings.

In France, the treatise of M. Chevalier, *La Monnaie*, the third volume of his "Cours d'Économie Politique," has held a pre-eminent place. During the first flood of the new gold, Chevalier wrote a work on the *Probable Fall in the Value of Gold*, which was translated into English by Richard Cobden. The proceedings of the *Enquête Monétaire* of 1870 are of great interest. Courcelle-Seneuil's *Opérations de Banque* is a leading work. Léon Faucher's small treatise on the *Production of the Precious Metals* is a work of merit. Louis Wolowski's writings on money in general, and particularly those in favour of bi-metallism, hold a high rank. The most energetic advocate of bi-metallism is M. Cernuschi, whose special antagonist for many years was M. Feer-Herzog of Switzerland. M. Esquirol de Parieu and M. Levasseur take the monometallist side. F. Lenormant's essay upon the money of ancient nations is of permanent value. The reports of the conference of the Latin union (France, Switzerland, Italy, and Belgium), and those of the international Monetary Conferences of 1867, 1878, 1881, and 1892, are of great value. Other writers on money who should be mentioned in any bibliography, however short, are Émile de Laveleye of Belgium, Prof. Léon Walras of Lausanne, Vrolik and Mees of Holland, and N. P. van den Berg of Batavia, now Governor of the Bank of Holland. William Roscher's treatise on money (translated into French by Wolowski), and Knies' *Das Geld* are perhaps the most important German works on this subject. Philip Geyer's *Theorie und Praxis des Zettelbankwesens* may also be mentioned. Bamberger's *Reichsgeld* and other writings are among the ablest extant upon the mono-metallic side. A. Soetbeer's investigations into the production of the precious metals are of high value. Prof. Miklashewsky, *Study of the chief positions of the classical theory in regard to the question of money* (Moscow), 1895. Leroy-Beaulieu, *Écon. Pol.*, 1896, vol. iii.] F. A. W.

MONEY (Quantity Theory). See the Quantity Theory of Money.

MONEY OF ACCOUNT. The "money of account," or the terms in which values are recorded, is, in modern monetary systems, generally the same as the standard of value of the country in which the accounts are kept; the metallic and note currency being reckoned in the same measure, while values less than that of the standard are expressed decimally. Thus, in the states of the "Latin Monetary Union" (France, Belgium, Italy, Switzerland, and Greece) accounts are kept in francs, in Germany in marks, in Scandinavia in crowns, and so forth. The money of account in Great Britain presents a slight variation from that of the majority of modern states from the fact that, although large sums are recorded in pounds, values smaller than that of the standard are expressed in shillings, pence, and farthings, instead of in decimal parts of a pound.

Though, from the point of view of simplifying and facilitating commercial transactions, it is desirable that the money of account should be identical with the standard of value, this is by no means a condition essential to the practical working of a monetary system. Neither is it necessary that the terms in which values are accounted should be represented by an actual coin in the circulation of the country. In England, for instance, when the shilling was the money of account, there were many years during which the only coins in use were silver pence, while at the same time the standard of value was a pound troy of silver of the millesimal fineness of 925.

Similar, and more recent examples of complex systems of currency and account are to be met with. Several such instances occurring in the early history of the British colonies are recorded by Mr. Chalmers in his *History of Currency in the British Colonies*, 1893, an interesting case being that of the Leeward Islands. In the 17th and 18th centuries the standard of value in this colony was a commodity known as "Muscovado sugar"; this article being also the principal medium of exchange. Accounts were, however, kept in sterling terms, and we learn that, by an Act passed in the year 1700, ratings of commodities in sterling, for purposes of account, were fixed as follows:

12s. 6d.	current money	for every	100	lbs.	of Muscovado
2s.	,,	,,	1	,,	Indico
9d.	,,	,,	1	,,	Cotton wool ginn'd.
1½d.	,,	,,	1	,,	Tobacco or ginger.

In Newfoundland, until so recently as 1887, when an Act consolidating and amending the currency legislation of the colony was passed, a money of account known as "Halifax currency" was in use. The ratings of coin in circulation under this system of account were fixed by an Act of the Assembly of the island passed in 1845, and were as follows:

	£	s.	d.	
Doubloon	3	16	9⅗	currency
Sovereign	1	4	0	,,
Crown		6	0	,,
Dollar		5	0	,,
Shilling		1	2⅖	,,

[See also Ideal Money.] F. E. A.

MONEY MARKET. A term applied to an organisation which has always existed in a more or less developed form in countries where wealth has had time to accumulate. Only its modern characteristics can be dealt with here, and the examination thereof must be confined to London, the largest and most highly organised example of the species.

The London money market consists of—(*a*) the Bank of England; (*b*) the joint-stock banks; and (*c*) one or two powerful private banks, the discount houses and bill brokers; (*d*) the

large mercantile houses who have money to lend from time to time; and (*e*) the Stock Exchange. As a rule the term "the market" is employed to denote classes (*b*) and (*c*) alone, the Bank being regarded as outside "the market," meaning the market for bills, while (*d*) and (*e*) are similarly excluded because their operations are of an intermittent character, and in the case of (*e*) are, as a rule, "all one way," the Stock Exchange being more of a customer for dealers in money than a dealer in money itself. There are, however, certain wealthy stock exchange firms who are really dealers in money, and not infrequently lend their surplus balances in Lombard Street. The great merchant houses are often very large lenders, through their possessing temporary control of considerable sums of money derived from loans, subscriptions to loans, remittances from foreign governments, and in other ways; and, on the other hand, they often take money out of the market by discounting bills or selling stock. They are, therefore, like the Stock Exchange, too closely allied to "the market" in the narrow sense of the term to be omitted from the list of elements making up the real market.

(*a*) The Bank of England.—Thirty years or more ago the Bank was an integral part of the London money market, possessing a power which it has not now. Formerly it had considerable influence on the discount rate, being a considerable holder of bills, but for many years past it has ceased to compete for bills with the great joint-stock banks, two of which have so large a share of this class of business that they practically control the discount rate on any day on which they are both buyers, or both "hold off" from the market. The Bank rate of discount has ceased to be any indication of the real discount rate in London, except very occasionally. This is not a satisfactory state of things, as the loss of control over the discount rate has involved the loss of power to influence the foreign exchanges, a power which is needed by the Bank in order to enable it to protect its reserve, which is the sole cash reserve of all the banks in the United Kingdom. The Bank has never explicitly admitted its responsibility for the reserve, but it does admit it implicitly. On the other hand, the banks ostensibly deny that they have any responsibility in the matter, but there is good reason for believing that they recognise it in practice, and will help the Bank to maintain a proper reserve should the course of events again place it in danger.

(*b*) The great joint-stock banks possess enormous power in the money market, owing to the magnitude of their deposits. The National Provincial Bank of England and the London and County Bank together hold over £97,000,000 of deposits, and the Union of London and Smiths and Lloyd's, both largely country banks with important offices in London hold about £91,000,000 more. The National Provincial and the London and County are the largest buyers and holders of bills in the market, and, as already observed, the rate of discount for the day usually depends on their operations. The banks meet from time to time to arrange what rate shall be allowed on deposits.

(*c*) The discount houses and bill brokers are also large buyers of bills, but they are not such "firm" holders of them as the banks. The smaller brokers, indeed, hold very few bills, though their turnover is often large, since they act as intermediaries between the great banks and the holders, as creators of bills. Strictly speaking they are not competitors for bills, but they provide the machinery by means of which the banks compete for them. The larger brokers and the discount houses are competitors of the banks, and hold considerable amounts of bills, which, however, they are quite ready to "turn out" at a profit, while banks, in nearly all cases, hold the bills until maturity. The bill brokers and discount houses work largely with money borrowed at call and short notice (seven or fourteen days). They publish the rates they are prepared to allow from time to time, which are usually in harmony with the terms offered to depositors by the banks, but they change their scale more frequently than the banks. Their meetings are of a more or less informal character, and changes are rarely made by any individual house alone, even when strong views as to the expediency of the proposed movement are taken by it. The brokers have a large area to borrow from. They obtain most of what they use from banks, but are also in close touch with the stock exchange money brokers, lending to them and taking money from them on consols and other high-class securities; and they have the Bank of England to rely upon in the last resort, though recourse to that institution is surrounded with restrictions, regarding the policy of which much difference of opinion exists.

The working of the Money Market.—Under normal conditions the London money market works very smoothly. Bills to a very large amount fall due every day and are paid; the "money" is reinvested in other bills, or if these cannot be secured on satisfactory terms, the "money" is lent in the short loan market on bills or stock, for periods which may vary from one day to a fortnight; or the "money" may be employed on the stock exchange either as a monthly loan on consols or until the "next account," which usually means about a fortnight. One great bank almost invariably reinvests money obtained from the payment of bills falling due daily in other bills, but most banks allow themselves a certain latitude in this respect, and the bill brokers have many more bills in their cases at some times than at

others, though they always try to keep up a certain average. In normal times all money in the hands of the market is lent up to the last penny, at some rate, by about 4 P.M. if possible. If nothing else can be done with it, it is lent "for the night," often at a rate which seems hardly worth accepting. Sometimes, for instance in 1894-96, money is very abundant for a long time. The high prices which rule during such periods for all the best investments, including bills, and the low prices of commodities and slackness of trade, have the effect of making money redundant in the market, except for brief intervals. There is then no disposition to invest capital for long periods, or to "lock it up" in industrial occupations. All who possess or have the control of loanable capital prefer, at such times, to keep it in a form as easily convertible into cash as possible, in order that when an opportunity occurs for profitable investment, advantage may at once be taken of it. When a revival of trade has begun, and the prices of commodities have risen, a change takes place in the attitude of the controllers of wealth. They find that more money is wanted to do a given amount of business than before, and that there is more business to do. The surplus money disappears from the market, and lenders have less difficulty in "placing" such surplus balances as they have on hand. When once this process has begun, it usually leads to a state of things the exact opposite of that we have been discussing; not only is all available money eagerly borrowed, but credit is stretched to the utmost. A great deal is invariably lent to the wrong people and on wrong securities, and finally a collapse of a more or less serious character occurs in credit. At such times the only quarter whence loans can be obtained is the Bank of England, as all other institutions have employed their resources to the utmost. On two occasions prior to 1866 the pressure on the bank was so great that the chancellor of the exchequer had to allow the bank to suspend the act of 1844, which restricts the note issue (see PEEL, Sir R.). The way in which the lock-up of capital in unsaleable securities, or securities on which loans cannot be obtained, comes into existence, may be very different at different times (see articles on CRISES).

The "money," or more properly the "loanable capital" with which the money market deals, is of a peculiar kind. It may be defined as wealth in its least specialised form, a form it can only assume in a very rich country, where all the specialised forms of wealth, but more particularly those which are easily exchangeable for other kinds of wealth, such as gold and high class securities, are very plentiful. All countries which have developed the modern form of civilisation possess a certain amount of "money-market money," but in all but a few it is of small amount. The supply of it in this country is enormous, but not unlimited, as events have more than once shown. Credit is based on this almost impalpable form of wealth, and when it has been exhausted by an excessive granting of credit, the fabric of credit breaks up. In the London money market, the organisation by which, to use a physiological analogy, non-specialised wealth is "secreted" and accumulated, is more effective than in any other at present known. This is owing to the fact that savings are almost universally deposited in banks, and that we possess a "one reserve system," as Bagehot called it, whereby the Bank of England has become the sole depository of the reserves of the banks of the United Kingdom. The system is not without disadvantages, but it is highly economical, and it appears likely to continue.

[J. S. Mill, *Political Economy*, bk. iii., *passim*, but especially chs. ii. and xii.—Bagehot, *Lombard Street*.—Goschen, *Foreign Exchanges*.—H. Sidgwick, *Principles of Political Economy*, bk. ii. chs. iv. v.—Palgrave, *Bank Rate and the Money Market*.—George Clare, *A Money Market Primer and Key to the Exchanges*.] W. H.

MONEY BILL (in Parliament). A "money bill" is a bill which seeks either to impose taxation or to allocate public moneys to some particular purpose. By constitutional usage such bills must originate in the House of Commons on the initiation of the government of the day. The resolution overthrowing the introduction of the bill must be passed in committee of the whole House (standing order 58). The House of Lords may reject, but cannot amend a money bill.

Where a bill is not a money bill, but incidentally involves the grant of public money, the grant must be passed by a committee of the whole house, and adopted on report before the clause which deals with the grant can be considered in committee on the bill.

The object of these provisions is, first to preserve the control of the elective branch of the legislature over all matters of supply, and secondly, to safeguard the public purse from unexpected attacks on it by private members.

[Anson, *Law and Custom of the Constitution*, vol. i. pp. 252-257.] M. D. C.

MONEYS TO BE PROVIDED BY PARLIAMENT. This is a technical phrase used in drafting acts of parliament. When the expenditure of public money is authorised, and it is intended that the expenditure shall not be charged on the permanent consolidated fund, but shall be voted annually in committee of supply, the act provides that the expenditure in question shall be defrayed "out of moneys to be provided by parliament." M. D. C.

MONEYERS may be called the manufacturers of coin, every mint having one or more

in charge of it, with, except perhaps in the earliest periods, subordinate workers under them. After Norman times they were no longer the sole officers of the London mint, but were assisted on the one hand and checked on the other by a growing staff of officials with separate duties. From the first, the responsibility of their office was recognised by the laws regarding them, and especially by the heavy penalties, such as the loss of a hand, which were enacted not only against false moneyers who counterfeited the coin, but against the authorised moneyers if guilty of any offence in the exercise of their office. The practice, found as early as the Anglo-Saxon period, of stamping on the coin, usually on the reverse, the name of the moneyer from whose mint it was issued, was probably intended as a check on irregularities, the more necessary on account of the large number of mints existing in the country.

In early days, when almost all public work was done locally, the mints were most numerous, as is known chiefly from the fact that from the reign of Athelstan (925-940) the name of the town of issue was commonly added to that of the moneyer. He ordered indeed that there should be a moneyer in every burgh, but it is not likely that this law was more than an extension of an already prevalent custom. In London, Canterbury, and Winchester there were at this time eight, seven, and six moneyers respectively. At one time or another there have been more than sixty royal mints in England, three in Wales, and one in Scotland, besides seven episcopal and two monastic mints in England; and this is exclusive of a considerable number of places for which the possession of mints and moneyers has been claimed on doubtful grounds. After Henry III. died 1272, the number of mints greatly declined, and the moneyers' names no longer appeared on the coins; and after Edward VI. died 1553, the mint in the Tower was almost the only one ever used in England except by Charles I. and during the recoinage under William III.

Moneyers seem to have held a position in regard to the king between that of a tenant-in-chief and a Jew, with special liabilities and special protection. They were obliged, if the king visited their town, to coin as much silver as he pleased; they paid relief direct to the king, and he was their heir if they died intestate; they paid an annual rent to the king and a sum of money on every renewal of the coinage for the new dies sent them from the London mint; the moneyers of London were excepted from the privilege granted by Henry II. to the other citizens of not pleading outside the city except in suits with foreigners. On the other hand they received some compensation for their disabilities; they sometimes enjoyed the right of *sac* and *soc* (see SOCAGE), they were sometimes exempted from TALLAGE, and they sometimes lived in a rent-free house. No doubt their business was profitable and was worth the certain payments and the possible penalties.

To preserve the uniformity of the coinage all moneyers had to use the dies supplied from London; even the two archbishops, who in early Anglo-Saxon days had put their own names and effigies on their coins, were obliged after Athelstan to use the royal dies, and later to pay an annual rent to the master of the mint; but they took the profits and at one time were allowed to distinguish their coins by some special mark. After Henry VIII. archiepiscopal coining ceased.

In the 17th century the moneyers of London were paid according to the bullion coined, not by a fixed salary, and their duties are described as follows in the *Report of a Select Committee* of 8th April 1697; "The moneyers draw, cut out, size, blanch, edge, and coin those bars (prepared by the workers) into monies, sissel and broakage back to the masters, by weight; these live in the country, attend the mint whenever called, take apprentices, and form themselves into a government, by electing one of them to be their Provost."

[Athelstan's Laws in Wilkins's *Leges Anglo-Saxonicæ*, 59.—Ellis, *Introd. to Domesday*, i. 174-177.—Ruding, *Annals of the Coinage*, pref. and ii. 135, etc. and appendix, p. 465.—Madox, *Hist. of Exchequer*, especially for tallage paid by moneyers.—Cunningham, *English Industry and Commerce*, vol. i.] E. G. P.

MONOMETALLISM. This term is applied to designate a monetary system in which the standard of value consists of one metal, whether of silver as once in Japan, and formerly in Germany, or of gold. Such a system, based upon gold, is found in England to-day. The silver and bronze coins circulating are token currencies, do not contain as much metal as their face-value represents, are regulated in their issue, and limited in their character of legal tender to small amounts—in the case of bronze to 1s., and in that of silver to £2. Gold alone, in the form of coin or of paper convertible into gold on demand, is legal tender without restriction in the payment of debt; and gold alone in the form of bullion is receivable to any amount at the mint, or by the Bank of England as the agent of the mint, and exchangeable for legal tender of the realm. Although, therefore the current media of exchange may consist of bronze and silver for small payments, and of notes and various credit-instruments, such as cheques and bills of exchange, for large payments, and gold may be actually employed in domestic transactions only for payments of intermediate amounts, yet the standard of value is gold alone; for the notes are convertible into gold on demand, and the various credit-instruments are promises to pay, which, according to the regulations of

legal tender, can in the last resort be made only in gold, or in paper convertible into gold on demand. The superstructure of CREDIT (*q.v.*) rests on the foundation of "cash" in the Bank of England; and "cash" consists of gold or paper convertible into gold.

This monometallic system was introduced into England on the resumption of cash payments after the period of the Bank Restriction. The system prevailing before had been one in which silver had formed the unit of account, but gold had been rated to it. Since the abolition of seigniorage charges in 1666, with the exception of a brief interval during the recoinage under William the Third, when the importation of gold guineas was prohibited for a few months to allow of the successful accomplishment of the necessary operations, and, at a later time, of the suspension of the free coinage of silver in 1798, the mint was freely open to the unrestricted coinage of both silver and gold, and both metals were indifferently regarded as unlimited legal tender in the payment of debt. In 1774 the tender of silver by tale was indeed restricted to £25, but it was apparently allowed to be tendered by weight without restriction. Between the recoinage under Elizabeth and that under William the Third, the silver remained unaltered in intrinsic value, but the gold was changed some four times. At the time of the later recoinage the current gold coin was the guinea, which nominally passed at twenty shillings. Owing to a deteriorated condition, due partly to wear and tear, partly to deliberate clipping and sweating, and partly to constant exportation of the heavier and better coins, the silver—of which the unit of account was the pound, but the coins actually current were for lower denominations—fell in value so rapidly that the guinea rose to thirty shillings. The question then presented itself, whether the silver should be reinstated in its former position, or the change in its value recognised and stereotyped in the new coinage. It was determined to restore the Elizabethan standard, and by successive stages the rating of the guinea was reduced. But, both before and after the recoinage, the silver was under-rated and the gold over-rated, in comparison with the rating which prevailed in other countries, and the increasing production of gold in the 18th century gave an added force to the natural consequences of this act. In accordance with the operation of GRESHAM'S LAW (*q.v.*) the over-rated metal found its way to the mint in increasing quantities, and the under-rated metal left the country; and, when a new recoinage was effected in 1774, the gold had taken the preponderant place in the currency, and its deteriorated condition demanded the chief notice, while the restriction mentioned above of the legal tender of silver by tale to sums of less than £25 seems to have been due to the existence of a large quantity of light silver which had taken the place of the heavier coins sent abroad. The recoinage was followed in 1798 by the suspension of the free coinage of silver; and, at the resumption of cash payments, gold was formally adopted as the standard, a heavy seigniorage was charged on the coinage of silver, its reception at the mint was definitely stated to be no longer free, and its character of legal tender was limited to sums no greater than £2. These changes were carried into effect by the younger Lord LIVERPOOL, but were in general agreement with the principles advocated by his father in the well-known *Treatise on the Coins of the Realm*. In some respects, indeed, they appear to have gone beyond the alterations recommended in that treatise, especially with regard to the seigniorage on silver. The elder Lord LIVERPOOL does not seem to have contemplated a charge exceeding the cost of coinage, which is technically known as BRASSAGE (*q.v.*), but it is probable that the heavier charge was prompted by a desire to meet the inevitable expense attendant on the resumption of cash payments.

The history, which has been given in brief, of the original adoption of the monometallic gold standard in England, has acquired considerable importance in later discussions on the merits of the system. It is urged by critics of monometallism that its introduction was accidental, that it conflicted, not only with previous practice, but also in reality, though not in appearance, with the theory of the older monetary authorities, and that it was made without a full appreciation of its possible results. On the other hand, the supporters of the system maintain that the Legislature merely endorsed by its sanction the informal and spontaneous choice of the people, that great inconvenience had arisen from the previous system, that the chief monetary reformers had repeatedly urged the adoption of the principles on which monometallism was founded, and that it was deliberately introduced to secure advantages which subsequent experience has shown to be inherent in it. These different views appear sharply antagonistic; but the difference turns to a considerable extent on the particular interpretation placed on certain words and actions, which admit of different meanings. There seems, for instance, little doubt that before the resumption of cash payments the currency had become preponderantly gold, and that a change in that direction had been evident throughout the 18th century. It is contended that this change was due, not to the deliberate preference of the people, but to an accident occasioned by over-rating of the gold and under-rating of the silver; and it

is urged that, at the time of the suspension of the free coinage of the latter metal, the conditions of production were altering in such a way that, had there been no such suspension, the currency would have become preponderantly silver. In a similar way different interpretations have been put on language used by PETTY and LOCKE, by NEWTON and by Adam SMITH (*q.v.*). They speak of one metal as the only possible "standard"; "one metal," says Locke, "alone can be the money of account and contract"; but the reformers of William the Third in thus speaking seem to have had especially before them the desirability of maintaining the Elizabethan standard for the silver pound, and they were fully aware that the gold was rated to it. They recognised a system under which both metals were freely received at the mint, and were indifferently legal tender in the payment of debt. They expressly urged the desirability of making the English rating accord with that prevailing abroad; and it was because their advice was followed imperfectly that the currency became preponderantly gold. Nor can there be doubt that the depletion of the silver was a real inconvenience; and that it was met successfully by the provisions for token coinage made at the introduction of the gold standard.

For the purpose of a convenient *internal* currency, regarded from the point of view of the media of exchange, such a monometallic system as that introduced into England at the beginning of the century possesses certain advantages. But the standard so formed is exposed, without any such compensatory action as is found in BIMETALLISM (*q.v.*), to the fluctuations in value of a single metal, whether these fluctuations be due to changes in production, or to alterations in the monetary policy of other countries, such as have characterised the last thirty years. It secures, it is true, a sufficient supply of convenient coins in the shape of tokens for small payments, and effectually prevents their exportation to other countries. Under the older forms of bimetallism, in which it was common for both the standard metals to be turned into coin, disadvantage attached to the use of the cheaper metal, silver, for large payments, as the coins required to settle a transaction of considerable amount were, either individually, or in the total mass, of great bulk, and the definite substitution under the monometallic system of the more valuable metal, gold, obviated this inconvenience. The comparative lightness of the English sovereign and the heaviness and cumbrous size of the French five-franc piece furnish examples of this difference. But now in a country like England coins are chiefly used in domestic trade, either as small change, or as a reserve against the issue of paper and as a basis for the superstructure of credit; and the more recent proposals for bimetallism contemplate the continuance of silver and bronze as token currencies for small denominations, of gold for purposes of change in larger dealings, and of paper money and credit instruments for negotiating still greater payments. In bimetallism, as thus conceived, the two metals would replace the one, in the main, if not exclusively, as a reserve against the issue of paper, and as a basis for the superstructure of credit. They would be freely receivable at the bank in exchange for legal tender, and they would indifferently form the basis of it. So far as the *domestic* trade of the country was concerned, it might, it is contended, be carried on as it is at present under our monometallic system.

With regard to *international* transactions, which would thus be chiefly affected by the adoption of bimetallism or monometallism, opposing arguments have been advanced by the supporters of either system. The use of a single standard is considered to attract business, at any rate of a financial nature, to the country where it is established, because every one knows precisely the mode in which he will be called upon to discharge his obligations to others, or will find that others meet their obligations to him. In London, for instance, it is contended, you are now always paid in gold, and pay in gold. Under a bimetallic system you might be paid in gold or silver, at the option of the debtor; and you yourself might pay in either metal as you preferred. This possibility, it is maintained, would not merely give rise to the inconvenience of being compelled on occasions to deal in international transactions with a bulkier instead of a lighter metal, but it would generate an uncertainty which would tend to drive away the business now attracted to London by the plain and recognised interpretation given there to monetary bargains.

On the other hand, monometallism, unless universally based on the same metal, fails to provide a par of international exchange. At present advanced nations appear, unless the tendencies of national policy are reversed by international action, to be likely to adopt and retain finally a gold standard. The example of England was followed by Germany at the conclusion of the Franco-German War, and Holland and the Scandinavian States imitated the action of Germany. The United States returned to specie payments on a gold basis after the civil war; in 1873, the Latin Union suspended the free coinage of silver, and adopted what has been distinguished as a limping or halting bimetallism, while Austro-Hungary, Japan, and Mexico have since established gold monometallism. For China a silver monometallic basis has been proposed to be kept by some method, not yet explained, on a level with gold. It should be added,

that some writers think that, were it feasible, silver alone would form a better standard for the world than gold. Experience has shown that it is more stable in value; and high authority (*e.g.* that of Ricardo), can be cited in its favour.

To these arguments monometallists answer that the difficulties of exchange between gold and silver-using countries have been exaggerated. There are, in short, they contend, no circumstances which would warrant the serious step of changing a monetary system, recommended not merely by its intrinsic merits—its simplicity and its convenience, and its freedom from international entanglement—but also by familiarity due to long establishment. A change in such a system would occasion a panic, or at least create confusion; and on negative and on positive grounds alike it is maintained that monometallism is the better system. Such contentions are not of course admitted by bimetallists (see BIMETALLISM); but they are confidently advanced.

[For the literature of the subject see the references under BIMETALLISM. For the history of the introduction of gold monometallism into England, Mr. R. H. Inglis Palgrave's Memorandum contained in the *Third Report of the Depression of Trade Commission* should be consulted, and also Mr. Dana Horton's writings, especially his *Silver Pound*, Mr. W. A. Shaw's *History of Currency*, and Lord Aldenham's *Colloquy on Currency*. Lord Liverpool's *Treatise on the Coins of the Realm* shows what considerations had weight with the authors of the change; and the reports of the debates in parliament at the time of the resumption of cash payments should be consulted. The evidence before the *Gold and Silver Commission*, together with the final report of the Commission, supplies an authoritative account of the arguments advanced by supporters and opponents of monometallism; and the evidence given before the *Commission on Agriculture* by Sir Robert Giffen and Lord Farrer, and by Professor Foxwell and Mr. Everett, should be referred to for a more recent statement of the case. The *Report of the Brussels International Monetary Conference* should also be consulted. Sir Robert Giffen's *Case against Bimetallism* on the one side, and Professor Nicholson's *Money and Monetary Problems* and Wilkie's *International Bimetallism* on the other contain discussions of various important aspects of the question. Professor Taussig's *Silver Situation in the United States;* M. de Boissevain's *The Monetary Question;* Mr. E. Helm's *Joint Standard*, and Professor Foxwell's articles and pamphlets should also be studied, and the publications of the Gold Standard Defence Association and of the Bimetallic League, which are authoritative, although avowedly controversial. Jevons's *Investigations in Currency and Finance*, and also his *Money and the Mechanism of Exchange;* General Walker's *Money* and also his *Money, Trade, and Industry*, and Professor Sidgwick's *Principles of Political Economy*, may be consulted for a more general and theoretical treatment of the question.] L. L. P.

MONOPOLIES. The issue of letters patent, granting the recipients the exclusive right of dealing in particular commodities or pursuing a particular trade, began long before the time of the Tudors, but it was only under them that monopolies began to be a serious abuse, and it was not till near the end of Elizabeth's reign that they became a real grievance. The subject came under discussion in parliament in 1601, when Mr. Laurence Hide on 20th November brought in a bill entitled "An Act for the explanation of the Common Law in certain cases of Letters Patent." The list of monopolies read on this occasion included such things as salt, currants, iron, playing cards, carriage of leather, ashes, bottles, vinegar, coals, etc. The salt monopoly is said to have raised the price from 16d. to 14s. or 15s. a bushel. Discussion on this occasion was stopped by a message from the queen, who promised to revoke all objectionable patents and grant no more. James I. on his accession issued a proclamation suspending all existing monopolies till the council should decide that they were not prejudicial to his subjects, but before the end of his reign they were being granted as freely as they had been by his predecessor. Matters were brought to a crisis by the action of the Purveyors (see PURVEYANCE), of whom Giles Mompesson (afterwards Sir Giles) was the most notorious. He originated a scheme by which the licensing of inns and ale-houses, then as now, under the justices, should be subject to the approval of two commissioners, himself and another, appointed by letters patent. The enormous bribes and fees exacted by these commissioners enraged the people, already excited about the general question of monoplies; the matter was taken up in parliament in the spring of 1621, Mompesson fled to the continent, and on the 31st March the monopoly bill passed the Commons, the three most obnoxious patents, those for inns, gold wire, and concealed lands, having meanwhile been cancelled by proclamation. In 1624 the monopoly bill passed the Lords. By it all monopolies, except the protection of inventions for twenty-one years, were declared illegal, the decision in any case being put into the hands of the judges. The exemption from its action of corporations, an exemption made on behalf of the great trading companies, the Levant Company and the like, was destined to give trouble in the next reign. In 1631 a company was formed and obtained a patent for making soap of English materials. In the following year it was invested with power to condemn all bad soap, thus obtaining a practical monopoly. A great quarrel ensued between the company and private manufacturers, which lasted several years and was of great political importance. In 1634 similar companies obtained monopolies for salt, shipping of coal, malt, and starch, and others were formed in

succeeding years till 1639, when most of the patents were revoked by proclamation. Then followed the civil war which put an end to the question of monopolies as it did to so many other vexed questions of royal prerogative.

[See *The Great Case of Monopolies*, and Lord Coke's remarks on it.—Hallam, *Constitutional History of England*.—Prothero, *Statutes and Constitutional Documents*, Cambridge, 1894.—Hume, *History of England*.—Gardiner, *History of England*, London, 1888.] A. E. S.

MONOPOLIES IN THE UNITED STATES. In the United States, aside from copyright and trade marks, there are no legal monopolies of consequence excepting the patent right. The patent right secures to the owner and his assigns the monopoly of the manufacture and sale of the patented article for seventeen years.

In certain isolated cases the state itself has owned and managed, either directly or by lease, certain industries, as, for example, the salt industry in the state of New York until the year 1894; but such cases are so rare that they are not worthy of detailed consideration.

The so-called "natural monopolies," meaning thereby the railroads, telegraphs, telephones, waterworks, gas and electric lighting plants, etc., in the United States, are ordinarily in private hands, under the more or less careful supervision of the state authorities. At the beginning of the era of railroad building there was no thought on the part of the citizens of a necessity for restricting railroads in their privileges; and in earlier years what laws were passed were either directly for the encouragement of the railroads, by means of grants of lands or guarantees of loans, or else they were general laws permitting any responsible corporation to undertake the building of a railroad in whatever locality it thought desirable, the power of EMINENT DOMAIN for compulsory purchase of private lands being granted freely. Within a few years later, however, especially after the smaller roads first built began to combine into longer through routes, the necessity of some restriction made itself felt. At first in New Hampshire, and soon afterwards in certain other states, temporary commissions were appointed to investigate the causes of accidents, and to recommend or, if necessary, prescribe certain regulations to prevent similar misfortunes in the future. In the years from 1850 to 1870, however, the roads had become so powerful and had made their influence so strongly felt through their discriminations in rates between different localities, and especially, as it was thought by the farming classes, through their exorbitant freight rates, that much hostile feeling was aroused. In the states of Illinois, Wisconsin, and Iowa especially, laws were passed prescribing strictly the rates of traffic, as well as restricting the freedom of administration in many other ways. These somewhat arbitrary laws were found to be so stringent that it was necessary to repeal some of them within two years. But the feeling against the railroads still existed, and careful control of them was attempted in other ways. In the eastern states, following the lead of Massachusetts, railroad commissions were appointed, with powers of investigating in detail the business of the roads, with the duty of advising the railroad managers, and with instructions to report annually to the legislature the conditions found, but with no power to enforce their decisions; it being hoped that the pressure of public opinion would be sufficient to secure just action on the part of the roads. In several other states, following the lead of Illinois, commissions were appointed with power not merely to advise the roads but to prescribe specific rates for freight and passenger traffic, to insist that sufficient facilities for handling traffic be provided, to make classifications of freight and passenger traffic, to regulate connections between trains, etc., and, through the courts, to enforce their decisions.

This method of control by the legislatures has spread from state to state until at present twenty-two states have railroad commissions for the control of the traffic that is carried on within the state.

Inasmuch, however, as a large part of the traffic is interstate, and inasmuch as under the United States constitution interstate commerce is under the control of the United States, it was found necessary to establish in 1887 the interstate commerce commission, a board consisting of five members appointed by the President, whose duty it should be to have the oversight of interstate commerce as the state commissions have of commerce within the separate states (see INTERSTATE COMMERCE LAW, U.S.A.). The powers of the commission are in the main those given to the commission of the state of Illinois. Under certain general rules laid down by the statute, the commission is empowered to prescribe reasonable rates, to take cognisance in a judicial way of complaints made of violation of the law, and to make rulings regarding them, the power of enforcement, however, being in the hands of the United States courts.

While, as yet, neither the state commissions nor the interstate commerce commission have been able to prevent all abuses, the law being frequently evaded, especially as regards discrimination in rates between different shippers, it is nevertheless true that these abuses, under the careful oversight of the commissions, are becoming rapidly less. The commissions are greatly extending their power, they are acting harmoniously one with the other, and there can be little question that they will be able in the future gradually to assume a more strict control of the railroads than has been the case heretofore.

In the United States the telegraphs are in the hands of private corporations. Earlier there were many competing companies, most of which, however, were gradually absorbed by the more powerful ones, until at present (1895) only two of consequence remain: the Western Union Telegraph Company, which controls from 85 to 90 per cent of the lines throughout the country, and the Postal Telegraph Company which controls the remainder.

Within the municipalities it is customary for the waterworks to be owned and managed by the municipality, though there are of course very many exceptions. Until within a very few years the gasworks were all owned by private corporations, but recently several cities —some twelve or fifteen—have obtained control of their gas and electric lighting plants. The only large city, however, which owns its own gasworks is Philadelphia. The tendency at present is clearly toward public ownership and management of the lighting facilities in the cities. The telephones in the United States are owned entirely by private corporations, most of them by the Bell Telephone Company, though, since the expiration of some of its patents within the last year, several rival companies have been started.

Of chief significance, however, in the United States are those monopolies which may be called capitalistic monopolies, the industries that become monopolies simply through the advantages that come from the use of large capital. The first great monopoly of this class was the Standard Oil Company, which, through a process of rapid growth through ten or fifteen years, with the advantages of lower freight rates on the railroads than its rivals could secure, finally, in 1882, was organised into the Standard Oil Trust, a combination that was able to control 85 per cent of the total output of refined petroleum in the country. For many years the business of the trust was confined entirely to the refining industry, the petroleum fields and raw petroleum being in the hands of other companies; but of late years one of the largest and most important of the petroleum fields has fallen into the hands of the Standard Company. The other most important capitalistic monopolies are the American Sugar Refining Company (Sugar Trust), the Distilling and Cattle Feeding Company (Whisky Trust); with several other large ones, especially the combinations controlling cotton-seed oil, linseed oil, white lead, dressed meat, cordage, and tobacco. In very many other industries, however, the leading manufacturers and dealers have formed combinations so that over large stretches of territory they have been able to hold almost a complete monopoly, some of the latest books on the subject giving, of the names simply of monopolies, lists that fill eight pages closely printed, and contain the names of some hundreds of distinct monopolistic establishments.

The word trust, as applied to monopolies in the United States, describes simply a form of business organisation. It is really a partnership of corporations. The plan was first devised by the Standard Oil Company, and was afterwards adopted by many others. It consisted, briefly, of an organisation made by a surrender on the part of the stockholders of the different corporations entering into the trust, of their separate shares of stock, to a board of trustees, the trustees holding from the individual stockholders an irrevocable power of attorney. In return the trustees issued trust certificates which represented an equitable share in the combined properties. The business of all the corporations was then managed in unison by the trustees, and the profits of all, being pooled, were distributed among the certificate holders in proportion to their holdings. In this way the interests of the different corporations were made common, the management was made harmonious, and no member, corporation or individual, had it within his power to withdraw from the organisation, as had been done earlier by members of some of the tentative pools that had been organised to prevent competition. Owing to hostile legislation against trusts, many of them have been put back into the corporation form by issuing to each trust-certificate holder a corresponding amount of capital stock in the new corporation, giving him an undivided interest in all establishments represented.

The causes of these industrial monopolies are clearly to be found in the modern form of industrial organisation, in which immense amounts of capital are required. Competition between such great establishments becomes so fierce that often ruin threatens all the rival establishments unless some form of agreement between them is reached. In many instances they have been aided by the railroads, which gave them preferential freight rates, sometimes the tariff laws have helped them.

The results of these monopolies are in part beneficial to society, in part dangerous. (1) A great saving to society is effected by working the best plants in the combination to their full capacity, and stopping the others entirely. (2) All the production in any one line is put under the management of the leading experts in the country. (3) A great organisation with branches in different parts of the country, by supplying its customers from the nearest establishments, is able to save much in transportation, especially in the case of bulky articles. (4) A very large establishment is able to save much in the way of side products that in a small establishment must be wasted. (5) A very great establishment can often afford to keep in its employ inventors and experts whose sole business it is to devise new and improved

methods of production. (6) Through these savings it is possible for the monopolies, while still making a good profit, to lower prices to consumers. A careful study of their influence on prices within the last few years in the United States, however, shows that, while their prices might have been lowered, the monopolies preferred rather to increase their profits, so that the prices have been somewhat higher than formerly under the system of free competition. It has been impossible, however, for the prices to be kept much above the level of competitive prices, on account of the new rivals that were thus called into the field. In the case of the sugar monopoly, for example, the higher prices demanded soon after the organisation of the Sugar Trust, within two years called several powerful rivals into the field, which forced prices down to competitive rates again for some two years, when, these rivals combining with the original trust, it thus obtained control of more than 90 per cent of the refining plants in the country, and again put the prices above competitive rates. Under monopoly, prices are doubtless somewhat steadier than under a system of free competition, but when changes are made in price, they are likely to be made with less warning and to be greater in extent than under a competitive system.

One of the greatest evils in connection with the trusts has been the speculation in their stocks by the managers. Nearly all of the most important of these capitalistic monopolies have been thus dishonestly managed. Again, there is a tendency, on account of the certain market and sure profits, for the managers of monopolies to become less enterprising, inventive, careful in business methods, than those with competitors, though as yet this tendency has not been strongly manifested in the United States. The fact that a much smaller proportion of the men engaged in business in the country are placed upon their own individual responsibility under the monopoly system, will beyond question have a powerful effect upon social conditions and business habits. Beyond doubt too the fact that these large enterprises were likely to be attacked by legislators, and that they also have desired important legislation, at times, in their own interest, has led often to corruption of legislatures and courts.

The danger to the public from these organisations has been so keenly felt that congress and no fewer than eighteen states have passed laws declaring them illegal, and prescribing heavy penalties for their promotion. Several court decisions also declare them illegal under the common law. Nevertheless, under some form they still continue. They are so clearly a product of present industrial conditions and methods that they can hardly be suppressed. Beyond question, the wisest way to deal with them is to control them by inspection and publicity, and possibly by some control over unreasonable prices, as there is in Canada. A commission like a railroad commission could probably control them sufficiently. Their possibilities for good are too many to make it desirable to destroy them.

MONOPOLY means literally sale by one man; but the term is extended to denote either sale, or purchase (*e.g.* of labour), by either one man or a group acting as one man (*e.g.* a trade-union). The definition thus enlarged is usually, or should properly, be limited by the condition that the monopolist deals, not with another monopolist, but with parties who compete against each other. Thus Ricardo (*Political Economy*, ch. vii.): "Commodities are only at a monopoly price . . . when the competition is wholly on one side . . . amongst the buyers." And this limitation is reasonable; for value in "isolated exchange" (Böhm-Bawerk) is not determined by the same laws as in "one-sided competition" (*id.*). Such is the definition here adopted; to the exclusion of a wider sense sanctioned by authority, according to which monopoly exists wherever the number of sellers is not reduced to one, but restricted to a class. It is in this sense that Adam Smith speaks of "the monopoly of the colonial trade," and Cairnes and Professor Bastable, of a country having the monopoly of an article, although the traders in the privileged country are not supposed to be in combination. So Mill treats of the "natural monopoly in favour of skilled labourers" (*Pol. Econ.*, bk. ii. ch. xiv. § 2, § 3, par. 1, ch. xv. § 3, last par.); and, in another connection, considers the case of the "sharers in the monopoly" being "numerous" (bk. v. ch. x. § 4). Senior, observing that competition is not free where the concurrence of "an appropriated natural agent" is required, describes the proprietor of such agent as a monopolist. According to him, all landlords are monopolists (*Political Economy*, p. 105); Schäffle designates as *Monopol Verhältnisse*, those advantages which he has treated of as "ausschliessende Verhältnisse." But according

to the view here taken, *Monopoly* does not include RENT and quasi rent.

Monopoly in the sense here adopted plays a greater part in modern economics than has been assigned to it in the classical treatises. Witness the spread of trade unionism, the growth of combination in the new form of trusts, the prevalence of joint-stock companies, particularly railway companies. Mr. Baker estimates that the yearly earnings of all "transportation lines" in the United States, are about one-tenth of the total value of all the year's products. The sphere of monopoly is also being enlarged by the growth of municipal and governmental industries.

The determination of value under monopoly is not so simple as might be supposed from some expressions of classical writers. Thus Adam Smith says: "The price of a monopoly is upon any occasion the highest which can be got" (*Wealth of Nations*, bk. i. ch. vii.); and Ricardo "when a commodity is at a monopoly price, it is at the very highest price at which the consumers are willing to purchase it" (*Political Economy*, ch. vii.). These propositions are true theoretically, upon the hypothesis that the monopolist makes a separate bargain with each buyer. But in practice he must often find a uniform price for all, or at least a whole class of purchasers. The simplest case is where one price is made for the whole market, and the article monopolised is supplied without cost, *e.g.* the water of a "mineral spring" (Cournot). The price is determined by the condition that price × the amount demanded at that price—the product of an ordinate and co-ordinate of the DEMAND CURVES—should be a maximum. The case is less simple, the representation less elegant, when cost of production is incurred by the monopolist, and when he fixes different prices for the same articles sold to different classes (*e.g.* theatre tickets to soldiers and to citizens), or for different articles which have in part JOINT PRODUCTS; such as the carriage of different classes of goods on a railway, the permanent expenses of which are paid out of the rates indiscriminately. The only general principle is to charge on each article "what the traffic will bear."

So far, we have supposed only one monopolist. But when there are two monopolists controlling respectively two factors of production, *e.g.* gas and water power, for which there is a joint demand, the determination of value is more difficult (Marshall, *Principles*, bk. v. ch. x.), the oppression of the consumer is likely to be greater (Cournot, *Principes*, ch. ix.).

There are several circumstances which prevent monopoly prices from rising to the full height determined by the preceding theory. The monopolist, for the sake of his own future custom, will not exact the uttermost farthing. Thus American railway companies nurse infant cities, and have even "discriminated" in favour of individuals who are likely to be good customers. Again, the monopolist will refrain from provoking competition by excessive prices. He may be influenced, too, by a regard for public opinion, and even a concern for the interests of the consumer. The last feeling may especially be expected where the monopoly is held by government. In this case, the surplus which the monopolist seeks to maximise will not be simply his own net revenue, but some mean between that surplus and CONSUMERS' RENT, which Prof. Marshall calls *Compromise Benefit* (*Principles*, v. ch. xiii.).

In general, prices under monopoly are higher than they would have been under competition, *other things being equal*. But other things are not equal, for the expenses of production are apt to be less under monopoly, owing (1) to the advantages of production on a large scale; (2) the avoidance of waste incident to competition. Four or five tobacconists in America spend annually in advertising against each other some 3,000,000 dollars (say £600,000), of which two-thirds at least could be saved by combination (Jenks). The balance of forces tending to raise and to lower prices, seems to be against the consumer in the case of some trusts which Prof. Jenks has examined. Even if the price of whisky, or refined sugar, has fallen, it has not fallen as much as might have been expected in view of the fall in the price of the raw material. Nor is the consumer much benefited by the alleged greater steadiness of monopoly prices. The variations in the price of whisky became, after the formation of the trust, less frequent, but more violent.

The injury to consumers is fairly well evidenced. The injustice to producers is even more clearly evident. Mr. Baker estimates that out of 18,000,000 American workers, some 5,500,000 derive benefit from monopolies; that is, about one-third are benefited at the expense of two-thirds. The greater part of the extra gains are concentrated in the hands of a much smaller minority. The high rate of profits enjoyed by trusts may be another evidence of inequitable gains, which it is difficult to obtain owing to the practice of watering stock.

One remedy for these evils is fortunately of comparatively easy application, where the monopoly is a corporation, namely publicity.

[For the definition of monopoly, consult Sidgwick, *Political Economy*, bk. ii. ch. x.; Senior, *Political Economy*, p. 103; and the *Nouveau Dictionnaire de l'Économie Politique*, with the references there given. As to the prevalence of monopoly at present, Foxwell "Monopoles" in the *Revue d'Économie Politique* for 1889; *Parliamentary Papers*, Foreign Office miscellaneous series, No. 174, 1890, c. 5826, 32, Report on Trusts; C. W. Baker, *Monopolies and the People*. Mill, *Political Economy*, bk. v. ch. x. § 4.] (See EXCHANGE, VALUE IN; PATENT AND PATENT LAW.) F. Y. E.

MONROE DOCTRINE, the name given to a celebrated declaration of policy made by President Monroe on behalf of the United States. It arose out of two separate complications. The first was the design of the Holy Alliance[1] to give assistance to Spain in her attempts to reduce her revolted South American colonies to submission; and the second was the series of differences between the United States, Great Britain, and Russia with regard to territorial dominion and boundary lines in the north-western parts of North America. Great Britain was strongly opposed to the Holy Alliance, and CANNING, who was then secretary of state for foreign affairs, informed the American government of its intentions, and proposed a joint declaration, setting forth that the two countries were determined to prevent the intervention of any foreign power in the struggle between Spain and her colonies. This project fell through; but it was known that the two English-speaking peoples were prepared to act in concert. Their determination to assist each other in keeping the Holy Alliance out of South and Central America was not affected by their differences with regard to the other matter dealt with by the doctrine under review. Under these circumstances, on 2nd December 1823, President Monroe, in his annual message to congress, declared, *first*, that "the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonisation by any European powers"; and *secondly*, that "we [the United States] should consider any attempt on their [the European powers'] part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have, on great consideration and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States."

These declarations have become a sort of sacred text, and they have shared the fate of other sacred texts in being overloaded with a mass of comments. And, as is usually the case, the commentators may be divided into two classes, those who seek to extend and those who seek to restrict the meaning of the original. The first part of the Monroe doctrine has been taken to forbid the acquisition of any further dominion on the North American continent by European powers (message of President Polk, 2nd December 1845); while the second part was held to justify even a strongly-worded protest against the confederation of the Canadian provinces (resolution of the House of Representatives, 27th March 1867). On the other hand, Mr. R. H. Dana, in his edition of Wheaton's *International Law*, sums up an elaborate examination of the whole subject by the statements that the declaration against colonisation referred only to the acquisition of sovereign title by new and original occupation, and the declaration against European interposition in the affairs of American states was meant to do no more than forbid the extension to the American continent of the system whereby the great powers exercise control over European affairs.

We need not discuss the statement that the American continent is closed against future colonisation. Whatever may have been the case in 1823, it is certain that in 1896 there is no part of the New World which does not belong to a civilised state. Territory in it may, therefore, be acquired by cession or conquest, but not by occupation in that technical sense which signifies the taking and keeping possession of what was at the time of seizure the property of no recognised subject of INTERNATIONAL LAW. The existence of boundary questions does not militate against this view. They presuppose that the districts in dispute are under the rule of some civilised power, the only difficulty being to apportion them among rival claimants.

The really important part of the Monroe doctrine is the assertion of the principle that the state-system of Europe must not be extended to America. Washington, in his farewell address, bequeathed to his countrymen the policy of keeping clear of European entanglements. They accepted the legacy, and soon showed a strong disposition to add to it the corollary that Europe must refrain from meddling in Transatlantic affairs. The circumstances already mentioned brought this clause of their political creed to the front, and it has remained ever since a cardinal principle of the external policy of the United States. Statesmen have differed as to how far it should be carried, but none

[1] Formed by Alexander I., emperor of Russia, in 1815; in conjunction with Francis I., emperor of Austria; and Frederick William III., king of Prussia.

have been found to deny it. Successive administrations have acted upon it with more or less of vigour, and the American people support it with practical unanimity. Like most other doctrines the Monroe doctrine has grown with the process of assertion and definition. It has been subject both to healthy development and to unhealthy growth. If we want to know what it is held to cover at any particular time, we must refer to the words and deeds of the American statesmen of that time rather than to the intentions and designs of President Monroe or Mr. John Quincy Adams, his secretary of state. There can be no doubt that in its name the United States would object to the acquisition of fresh territory on the American continent by any European states, whatever were the means employed for obtaining it; and quite recently President Cleveland has argued that it justifies his intervention in the boundary dispute between Great Britain and Venezuela. The United States do, in fact, occupy a position of pre-eminence in the New World very similar to the position of the six great powers in Europe, though they have kept themselves free from pledges to other American states to assist them against European attacks; and they define and defend their hegemony by reference to the Monroe doctrine. That doctrine is not international law; but it is a cardinal principle of American policy, which other powers must take into account if they wish to keep on good terms with the great Transatlantic republic. Indications have not been wanting that the doctrine may develop an economic side, which would in practice tend towards a commercial union of American states.

President Monroe's message of 1823, containing the statement of the Monroe doctrine, is given in full, in No. 56 of the *Old South Leaflets*, recently published by the directors of the Old South Studies in History, Old South Meeting House, Boston, Mass.]. T. J. L.

MONTAIGNE, MICHEL DE (1533-1592). Although, in his rambling way, the author of the *Essays* touched on innumerable topics, he rather cautiously avoided social and political questions.

"We owe submission and obedience to all kings, for this is due to their office, but we only owe our esteem and affection to their virtues" (bk. i. ch. 3). Having satisfied his conscience with this restriction, Montaigne, who lived in the midst of the havoc of religious and civil wars, invariably repeats that he is "disgusted with novelty, whatever may be its features" (bk. i. ch. 22).

He had come to the conclusion that "the profit of one man is the loss of another" (bk. i. ch. 21), and expressly mentions the merchant as an illustration. On sumptuary laws, he is more enlightened; he considers them as going against their object, as good examples derived from kings and great people would be much more effective (bk. i. ch. 43). Some hints on the desirableness of instituting municipal offices of information, and on the usefulness of keeping detailed and accurate family journals and account books (bk. i. ch. 34), are probably the only remaining utterances of Montaigne which ought to be noticed here.

E. Ca.

MONTANARI, GEMINIANO (1633-1687). Born at Modena, Italy. An able mathematician and astronomer, he was mathematical professor for fourteen years at the university of Bologna, and afterwards professor of astronomy and meteorology at the university of Padua, in which city he died. To students of economics he is known by his two works on coins, written about 1680, and published seventy years later by Argelati in his collection of works on coins, and afterwards reproduced in the collection of CUSTODI. These works possess much merit notwithstanding the evident traces of the influence of BODIN—an influence greatly felt by all thinkers at that period.

Fluent and animated in style, Montanari freely criticises the mistaken views held in his day on the coinage question, and the injurious effect of alterations in coins, and the raising their nominal value; and points out the rules which should be observed in coining money at the mints. His investigations on money necessarily lead him to an examination of the question of value. He combats the idea of an invariable relation of the value between gold and silver asserted by Bodin and SCARUFFI. He reduces the laws of value to the element of scarcity —understanding scarcity not as absolute, but relative to the extent of the demand.

In his researches, says Graziani, Montanari succeeds in explaining all the general phenomena of value, though without thoroughly understanding the intricate and difficult subject—the value of money.

Breve trattato del valore delle monete in tutti gli stati, 1680.—*La zecca in consulta di stato, trattato mercantile*, etc. 1687. Republished by Custodi in his collection of Italian classical economists, under the title of *Delle monete, trattato mercantile*.

MONTCHRÉTIEN, ANTOYNE DE (*c.* 1576-1621), a Huguenot, a second-rate poet, and a hard-ware manufacturer, dedicated in 1615 to the king (Louis XIII.), and the queen-mother, his *Traicté de l'Œconomie Politique*. This seems

to be the first work ever issued under that title; and the use of the phrase is undoubtedly significant. But there is absolutely no ground for the assertion, maintained by some enthusiastic French writers, and notably by his latest editor, M. Funck-Brentano, that Montchrétien was the creator of political economy, or even that he was in any way a considerable economist. There is hardly a single argument or proposal in the book that is not borrowed from earlier writers; the passages which have been most praised for the trade policy they advocate are taken almost verbatim from BODIN. The book is really nothing but a thick mercantilist pamphlet; its style is grandiloquent and long-winded, and full of repetitions; and it is only valuable for the miscellaneous information it gives as to contemporary conditions of industry and trade in France.

The *Traicté* has been edited with a long introduction by M. Funck-Brentano (Paris, 1889); and its unoriginal character demonstrated in the *Eng. Hist. Rev.*, vi. (1891), 779. W. J. A.

MONTESQUIEU, CHARLES DE SECONDAT BARON DE LA BRÈDE ET DE MONTESQUIEU (1689-1755), born and died at La Brède near Bordeaux. One of the ablest thinkers of the 18th century, he may be considered rather a student of political science than of political economy alone, a science which in his time scarcely existed, at least not as a distinct branch of study. Following on some works in which he asserted more than he could prove, Montesquieu wrote in 1721 his *Lettres Persanes*, which for a time were all the fashion, and seven years later (1728) opened to him the doors of the French academy. This book, keen and witty criticism as it was of the men of his time, would not, however, have secured to the author that widening renown which his name has attained.

The works which have immortalised the name of Montesquieu are the two following: the first, critical and historical, is entitled *Considérations sur les causes de la grandeur des Romains et de leur décadence*, 1734; the link it possesses with economic science is through politics, as in the passage, "It is not fortune (in our time we should say chance) which rules the world. . . . There are general causes — moral or physical — which operate in each kingdom, which raise, preserve, or ruin it; every accidental occurrence is subordinate to these causes; and if the chance of a battle, that is to say a particular cause, ruins a state, this takes place because there was a general cause which led to the destruction of the state by a single battle. In short the principal force induces all particular accidents," ch. xviii. Again, the universality of immaterial laws is asserted thus: "As men at all times have had the same passions, though the occasions which produce great changes are different, the causes are always the same" (ch. i.).

The second book, *De l'Esprit des Lois*, 1748, on a much larger scale than the first, was written throughout in the same exact and concise style peculiar to the author, and had been under preparation for some time (1728-1748), the latter year being the time of its appearance. The reputation of this masterpiece has increased with time; but it was warmly welcomed even on its first appearance.

Madame du Deffand said with a sneer, that it was "de l'esprit sur les lois." Voltaire appreciated it more highly when he wrote "the human race had lost its title-deeds; M. de Montesquieu has found them and returned them." The fact is, that though the work may have grown antiquated both in form and through the advance made in moral and political science during a century and a half, it attains in many passages a marvellous elevation, which excites first astonishment and then admiration. The remarks on the influence of climate on national character and economic condition, bks. xiv.-xvi., are among Montesquieu's most characteristic points. Some passages on economic questions may be selected, in which the author is indisputably in advance of his age. Thus in bk. xx. ch. ii. "The natural result of commerce is peace. Two nations trading with each other make themselves reciprocally dependent. If it is to the interest of one to buy, it is to the interest of the other to sell, and all unions are founded on mutual necessities." Bk. xx. ch. ix., "it is commerce which sets the right value on commodities, and which establishes true relations between them." In the countries in which loans of money at interest are not regarded favourably by the law, "the lender takes on himself the risk of breaking the law," and "the rate of interest increases in proportion to the risk of the loan not being paid." "Continence is naturally linked with the expansion of the race," bk. xxiii. ch. ii., written a century before Malthus, he appears to anticipate some of that writer's conclusions. Montesquieu was in favour of direct taxation of individuals, not a taxation in proportion to their wealth, but a taxation in proportion to the surplus remaining after the satisfaction of their ordinary wants. In short, he proposed to divide the citizens, as at Athens, into classes, according to the condition of the individuals. No doubt there were economic subjects on which he too readily adopted the mistakes of his time. He supported the sale of offices; he inclined to the mercantile system; he had no clear idea of the economic position of money, though he said, and rightly, "that the use of money by a nation was one indication of civilisation," bk. xviii. ch. xv. He preached also the equalisation of individual property, sympathising too much with the spirit of Lycurgus in this. It was the influence of this spirit which caused him to regard a long-continued period of national security as leading to corruption and decadence. He would willingly have consented to give up the use of money to attain the ideal of government realised by the Jesuits in Paraguay. Though he could not free himself from some of the economic errors of his time, Montesquieu showed often, and on points of the highest importance, the superiority of his judgment. In these cases he was much in advance of his contemporaries. It should not be forgotten that his book *L'esprit des lois* appeared ten years before the *Tableau Économique* of Quesnay, and twenty-

eight years before the reforms of Turgot and the publication of the *Wealth of Nations*. This great thinker dominated his own age and often anticipated the economic ideas of the future.

[See references to Montesquieu in A. Smith, *W. of N.*, bk. i. ch. x., as to effect of law on rates of interest; bk. v. ch. i., as to education and morals among the Greeks. — Hume, *Essays*, No. XI., on "Populousness of Ancient Nations," and in note T.] A. C. f.

MONTHLY ASSESSMENTS were a tax first levied by the long parliament during the civil war, continued throughout the commonwealth, and occasionally used under Charles II. and William III. They were an improvement upon the old SUBSIDIES, being more evenly assessed rather than more productive. A sum, based upon the highest produce of a subsidy, was fixed, and proportionately assessed upon both real and personal property by local commissioners for each county; it was levied upon occupiers, to be by them deducted from their rent. Church lands and goods were included, and it was the establishment of this as permanent which occasioned the cession by the clergy in convocation of their taxing powers in return for the right of voting at parliamentary elections. The tax varied from £35,000 to £120,000 a month, and was generally levied for three or more months in succession, a proportionate sum being also sometimes obtained from Scotland and Ireland. After 1690-91, the year of the highest sum ever raised by this tax, monthly assessments gave way to a new form of property-tax.

[Dowell's *Hist. of Taxation*, vols. ii. iii.—For details of assessment in 1660 see Sinclair, *Public Revenue*, i. 304, note.] E. G. P.

MONTHS, FOURTHS OF. In any analysis of the returns of the Clearing House, reference is frequently made to the "Fourths of the Month." The origin of this is found in the fact that a custom exists in many branches of trade to date the bills drawn on their debtors on the first day of the month. These bills become, according to the English mercantile law, by the operation of the DAYS OF GRACE (*q.v.*), payable on the fourth of the month in which they fall due. Hence a larger number of purely commercial transactions, as a rule, pass through the Clearing House on the fourth of the month than on any other day, and the amount of the returns is regarded as a proof of activity or slackness in trade. This observation refers, as stated, to the "purely commercial transactions"; those on stock exchange account days, and consol settling days, largely exceed the "fourths of the months," but it is only the latter which are under notice here.

The table which follows shows the amounts paid on the "fourths of the month," since the commencement of the publication of the clearing house returns in 1868, to the present time. The totals of the annual clearings are likewise added, and columns of proportional figures. By these the progress of the transactions of the "fourths of the month," relatively to the total transactions can be easily traced. It will be observed by comparing column three with columns four and six, that the amount of business done on the "fourths of the month" has not kept its own relatively to the total transactions. This corresponds to the known fact that fewer bills of exchange are now drawn in proportion to business done than used formerly to be the case. At the same time the "fourths of the month" are still important, and the amount of business done on those days is carefully watched and noted by those engaged in business.

London Clearing House Returns, 1868-1905. Amounts on the 4ths of the Month and the total.

1 Year.	2 Clearings on Fourths of the Month.	3 Proportion of amount in each year to 1868. 1868 = 100.	4 Proportion of Fourths of the Month to total.	5 Total Clearing for the Years.	6 Proportion of amount in each year to 1868. 1868 = 100.

MONTS DE PIÉTÉ. Early in their history several small Italian states exacted from their citizens forced loans, on which interest was paid;

the sums of money thus raised formed what was called a *mons*, or heap. The name of *montes pietatis* is derived from this; the second word distinguishes these from the earlier founded *montes coacti*, and is given to the charitable funds for granting loans on the security of pawned articles, which were established in Italy towards the middle of the 15th century (Orvieto, 1463, Perugia, with papal authority, 1467, Viterbo, 1472, etc.). The Franciscans were their warmest advocates, and various spiritual and temporal privileges were granted to the contributors to this pious purpose; but as they proved inadequate to attract the necessary funds, several *montes* began to accept deposits at a moderate rate of interest. This, and the levying a small percentage to cover working expenses, gave rise to a fierce controversy between the Franciscans on the one side and the Dominicans on the other, the latter maintaining that the system was based on usury (see CANON LAW). However, in 1515, the Lateran council and the pope, Leo X., sanctioned the right to levy a moderate interest, provided the object were not to realise a private gain. Thenceforward the Italian *monti di pietà*, mostly under ecclesiastical management, enjoyed the steady protection of the popes, though some of them, especially the *mons* in Rome, assumed much of the character of a bank, and became owners of considerable property.

In Spain, notwithstanding the national religious devotion, and the rapid success of these institutions in the Spanish Netherlands, the first *monte de piedad* was not founded till the beginning of the 18th century under Philip V., the first king of the Bourbon dynasty. They now exist under government supervision in the most important towns. The *montes de piedad* are to be distinguished from the numerous *montes pios*, which like the *montes granatici* in Italy, supplied corn, wine, and agricultural produce generally, to the population during periods of scarcity or at seed-time.

North of the Alps, the *monts de piété* found at their first introduction a congenial soil in the Netherlands, where the pawning business had until then been monopolised by Italian money dealers, whose authorised rate of interest varied from 20 to 55 per cent, and who, in the popular Flemish language, have left their name (*Lombaard*) to the *monts de piété*, although a designation literally translated from the French (*Berg van Barmhertigheid*) has taken its place in modern times. They were first introduced in 1618 by Wenceslas Cœberger under archduke Albert, and soon were in operation in all the principal towns. Placed under the control of a general superintendent, they rather combined the characteristics of banking and of charitable establishments, lending at from 15 to 18 per cent. In modern Belgium the managing officers are appointed by the communal authorities, and the funds supplied primarily by the *Bureaux de Bienfaisance* (poor boards), secondarily by the municipality itself.

In Germany, the civic authorities had, from the commencement of the 14th century, established banks on their own account in some of the imperial towns, Frankfurt 1402, Nuremberg 1598; these banks cleared the way for the adoption of *Pfandhäuser* on the Italian model. The first of these was founded in 1591 at Augsburg and still exists. This example was soon followed in Nuremberg, Ulm, and later in Hamburg (1650). A great number of these establishments, often of a municipal, sometimes of a private character, were started during the 18th century. Owing to the federal constitution of the German empire and the legislative powers of the individual states, state, municipal, and private *Leih* and *Pfandhäuser* co-exist at the present day; the Berlin *Leihhaus*, for instance, is a royal institution. The ruling principle may be stated thus: private *Pfandhäuser* must be licensed, and are submitted to control by the local authorities, but the licence cannot be withheld on other grounds than personal unworthiness, or the absence of the need for such an establishment. The authorities of each state may require its foundation, wherever the want is felt. Generally speaking, the same system of licensing prevails in Austria.

In France, notwithstanding some ineffectual attempts under Louis XIII. and Louis XIV. it was long before the *Monts de Piété* were naturalised. After 1577 one was installed in Avignon, which city was papal territory until the French Revolution. In 1777 a royal patent was granted to the managers of the hospitals to set up a house for loans on movable pledges in Paris; they lent at 10 per cent *per annum*, and from 1777 to 1789 the yearly totals of their loans amounted on an average to about 8,000,000 sterling. The National Assembly decreed the liberty of the profession, and during the troubled period of the first republic the most frightful abuses ensued. In 1797 the Directory appointed five *administrateurs* of respectability to re-open the *Mont de Piété*, which had been closed in 1795, and to start it anew with their own capital, amounting to £20,000. The rate of 3 per cent per month at which they advanced money was gratefully hailed by crowds of needy borrowers. Through the confidence they inspired, the *administrateurs* were able to raise money on lenient terms, and gradually to bring down the rate of interest on their own loans to 12 per cent per annum. In 1804 Napoleon paid off their shares, and the Paris *Mont de Piété* became a public institution enjoying a monopoly for this kind of transactions. Until 1840 twenty-four *commissionnaires* acted as intermediate agents between the population of distant quarters and the *Mont de Piété* itself, but they were then suppressed, and branch establishments

organised in their place. Similar institutions are now to be found in all the chief towns of France; under a law of 1851, they must be authorised by the municipal council and managed by a paid director assisted by a board, whose unpaid members are appointed by the prefect and presided over by the *Maire*. The surplus of receipts over expenses, after a proper deduction for forming the necessary capital, must be paid over to hospitals or other charitable institutions, according to the decision of the prefect. The *Monts de Piété* are entitled to accept donations and legacies.

The contracting a loan is authenticated by a document called *reconnaissance;* the value of the article pledged is ascertained under the joint responsibility of official *commissaires priseurs;* and as *reconnaissances* are transferable, this way of proceeding has given rise to a rather unpleasant traffic based on the lowness of the estimates (see the *Économiste Français*, August 1890, p. 133). At the end of the stipulated term, generally one year, the articles must be redeemed or the engagement renewed; if these formalities are not gone through, they are sold by public auction, the borrowers having three years to claim the eventual surplus resulting from the sale. Any borrower may require the sale of the articles he has deposited at the end of three months. The Paris *Mont de Piété*, whose operations exceed those of the forty-one provincial *Monts de Piété* (say about £1,400,000 against £1,000,000 a year), grants advances, since the beginning of 1894, on securities such as shares, debentures, national stock, etc. It accepts deposits at from 2 to 3 per cent, and charges 7 per cent (commission included) on its loans.

Many objections have been made to *Monts de Piété*. It has been said that they put on the same footing the spendthrift, the prostitute, and the deserving head of a family, and that they deprive the borrower of the use of the pawned articles, whilst the owner of a mortgaged property can earn the monies required for payment of interest and repayment of principal. Still it cannot be doubted that there is a great deal of truth in Turgot's opinion (in his *Mémoire sur les Prêts d'Argent*), that "the poor man is happy to find the assistance he wants without being exposed to any other risk than the loss of his pledge." (See CANON LAW; PAWNBROKING.)

MONTYON, ANTOINE ROBERT AUGET, Baron de (1733-1820), was born and died in Paris. Montyon was known chiefly by the establishment of his "prix de vertu," and also by the Montyon *prix de Statistique* founded in his honour, and won, among others, by LE PLAY.

He left two works, still often read, though they contain much rubbish mixed only with a little that is good. These are: *Quelle influence ont les diverses espèces d'impôts sur la moralité, l'activité, et l'industrie des peuples*, 8vo, 1808, reprinted in 1848 in Guillaumin's collection (*Mélanges d'économie politique*, t. ii.), and *Particularités et observations sur les ministres des finances de France les plus célèbres de 1690 à 1791*, 1812, 8vo. In the first of these works, Montyon writes rather as a philanthropist than an economist or a financier. He desired that taxation should inculcate morality, should favour marriage, be heavy on those who remained single, and hinder luxury. In the second, he extolled Necker, and declares that Turgot had done nothing important for the prosperity of France. He showed his firmness of character when he chose rather to forfeit his position as commissioner than to acquiesce in the violation of the irremovability of the magistrates committed in 1771, by the chancellor N. de Maupeou, the protégé of Mme. Du Barry. A. C. f.

MONYPENNY, DAVID, author of a work on the *Poor Laws* "a work of considerable authority," M'Culloch (*Lit. of Pol. Econ.*, p. 298).

He wrote: *The claims of the Established Church of Scotland on the country . . . in the present Crisis.* . . . 2nd ed., Edinburgh, (1838 ?), 8vo.—*Proposed Alterations of the Scottish Poor Laws . . . considered and commented on.* Edinburgh, 1840, 8vo.—*Remarks on the Poor Laws and on the Method of Providing for the Poor in Scotland*, 1st ed., 1834, 8vo, 2nd ed., with additions, 1836, 8vo. A. L.

MOORE, ADAM (fl. 1650) was author of *Bread for the Poor and Advancement of the English Nation promised by enclosure of the Wastes and Common Grounds of England*, London, 1653, 8vo. Moore lays stress on the effect of adjacent commons in engendering idleness, with its consequence, penury. Commons being divided into "uplandish" and "marish," their respective merits as breeding and feeding places for horses, cattle, and sheep, and as providing fuel, are dealt with. The conclusion is that one-fourth part of the commons, when improved, will be worth as much as the former whole. Assuming that there are two million acres of such wastes in England and Wales, the enclosure of one-fourth of these will maintain an additional 750,000 of population. Moore proposes a "grand committee" for each county to settle private claims. The poor cottagers are to be protected by the portions allotted to them being held in free SOCAGE for ever, under a small yearly rent. The value of

their holdings would be thus raised from about 3d. to £40 or £50 (see ENCLOSURES).

[The merits of the tract have been perhaps overrated by M'Culloch, *Literature of Political Economy*, but its value as historical evidence is undeniable.] H. E. E.

MORA. A party to an obligation who fails to perform what is due from him when he has received notice from the other party demanding performance, *interpellatio*, is, according to the terminology of Roman law, *in mora—mora debitoris*. From the time of its occurrence he is bound to put the party who makes the claim in an equally favourable position, as if performance had been made without any default. So he must pay interest from that date, though he may not previously have been liable to do so; and he becomes liable for all loss or damage attributable to accident, as well as to negligence, where he holds the property of another as bailee. So too, if the thing to be delivered falls in value after *mora* has set in, he must pay the highest value the thing has reached since that occurrence, unless he can prove that the party to whom he should have made delivery of the thing would not have disposed of it.

In some cases actual notice of the claim is not necessary to constitute *mora*, as when a future time of payment is fixed by the contract, according to the maxim, *Dies interpellat pro homine*. A party who is entitled to performance may be in *mora—mora creditoris*—on his side. This happens if he refuses to accept performance, when performance is duly tendered to him. The effect of this is, not to discharge the obligation, but to make him liable for all loss to the other party, which is a consequence of his not having accepted performance.

MORAL RESTRAINT. See MALTHUS.

MORALITY, SYSTEMS OF, IN RELATION TO POLITICAL ECONOMY. The relation of morals to economics is often misunderstood. Political economy is, properly speaking, a science rather than an art. It aims in the first instance at the explanation of a certain class of facts, the facts, namely, of the production and distribution of wealth. The special knowledge of economic facts possessed by the economist may enable him to give valuable advice on economic questions, but this, strictly speaking, is not his business. His business is to explain, not to exhort. It is therefore beside the mark to speak of economists, as such, preaching a low morality or rejecting morality altogether. There is, however, a real relation between economics and moral science. For the facts with which political economy is concerned are in great measure facts of human conduct, and all human conduct is included in the field of moral inquiry. Hence a twofold connection between morals and economics. For in the first place the economist cannot explain the action of human beings with reference to wealth, unless he has a theory of human nature, and a theory of human nature must include a theory of morals. The theory of morals of an economist need not be original or peculiar; it may not even be very clearly conceived; but a theory of morals he must have. The economist's theory of human nature and of morals will affect his account of the motives which unfit men for exertion, of the uses of competition, of the effects of the institution of private property, the influence of slavery or of personal freedom, of the economic bearing of different forms of religious belief or political constitution, of the result of different occupations on the economic capacity of man, of the economic results of the growth of population, the subdivision of land, the increase of luxury and countless other phenomena which come within the purview of his science. Thus the Greek theory that complete leisure is necessary to the perfect life, led Aristotle to hold that there must exist a class of producers themselves incapable of that life, but making it possible for those who were more gifted. Aristotle concluded therefore that the institution of slavery which he found in existence was a necessary condition of the highest civilisation. The mediæval doctrine that it was sinful to take interest for money, tended to prevent any exhaustive inquiry into the nature and uses of capital. The modern doctrine that comfort is an aid to virtue, and an abundance of means a help towards a good life, has led speculative minds to devote much more attention to the processes of production and distribution, and to take a much more complacent view of lives spent chiefly in the acquisition of wealth. How differently different minds will interpret the same economic facts may be seen by comparing Adam Smith with Ruskin. To Adam Smith happiness, that is the greatest amount of pleasure and the least amount of pain, was the only rational end of action; he approved of personal freedom and competition as means to this end. To him, therefore, modern society appears to be in a constant state of improvement. Ruskin does not allow that happiness in this sense is the end of action. He maintains that subordination and co-operation are the true means of obtaining the highest good. He therefore regards as indications of decay much that Adam Smith regards as indications of improvement. In no science, least of all in the sciences which deal with man in society, can there be such a thing as pure passive observation. The scientific intellect always brings as much as it finds, and unconsciously imposes its forms of thought on the object which it studies. What we are and whither we are going nobody can fully tell; and each

man's version of human character and destiny is tinged with the colour of his own mind.

The charge of a low morality so often brought against the classical economists rests partly, no doubt, on the misconception of supposing that they approved of everything which they recorded, but it also rests partly on the fact that they accepted the current moral theories of their time. These theories were various forms of what is known as HEDONISM (Gk. ἡδονη, pleasure). Locke and his successors were supposed to have shown that the soul is a mere sentient subject. If this be so, good must mean pleasure, and evil pain. The rational end of action must be the greatest amount of pleasure with the least amount of pain. This moral doctrine took two principal forms, one egoistic, the other philanthropic. According to the egoistic or Epicurean version the individual can seek only his own happiness; according to the philanthropic or utilitarian version he can seek and should seek the happiness of all. The link between the two theories is supplied through the social instinct, by gratifying which man secures at once his own happiness and that of his fellows. The utilitarian doctrine, first outlined by Hume, and afterwards elaborated by Bentham, seems to have been the theory of morals accepted by Adam Smith, by Malthus, and by most of their immediate disciples, French and English. But the philosophic and practical shortcomings, even of this enlarged hedonism, were severely exposed in the philosophical reaction of the 19th century. With all its kindliness and common sense the favourite moral theory of the older economists appeared defective both in depth and in elevation. They were accused of explaining social phenomena by the help of a low conception of human nature. The charge was grossly exaggerated, but it was not altogether destitute of foundation. Later economists frequently seem to have no definite theory of human nature, good or bad.

In the second place the economist has to take account of the various theories of morals which have found acceptance in different ages and countries. It is true that the mass of mankind never formulate a theory of conduct. Men act upon instinct, but the instinct implies a doctrine, and this doctrine is made explicit by the accredited teachers of the day, philosophers, priests, or men of letters. Did space allow, it would be easy to show how different has been the influence upon the production and distribution of wealth exercised by the classical, the mediæval, and the modern ideals of conduct. But the subject would require many volumes for its elucidation. The position taken by economists with reference to morality and systems of morals is to be understood rather by the general tenor of their writings than by reference to particular passages. It is the utilitarian spirit, not the utilitarian dogmas, which so many of the older economists adopted.

MORATORY LAW. A moratory law is a law passed in times of emergency, postponing for a specified time the due date of bills of exchange and other obligations. The delay or period of grace accorded by the law is sometimes, though not perhaps correctly, spoken of as a "moratorium." During the Franco-German war of 1870-71 moratory laws were several times passed by the French government. Their international effect was discussed at length and their validity upheld in the case of *Rouquette v. Overmann* (1875) L.R., 10 Q.B. 525. It is of the essence of a moratory law that it should be enacted to meet some special, political or commercial emergency. For example the Bank Holidays Act 1871, which makes all bills maturing on a bank holiday payable on the succeeding day, could not properly be described as a moratory law, because it is a permanent enactment. (See also MORA.) M. D. C.

MORCELLEMENT. This French term, literally "parcelling," is specially used to express the division of land among small peasant proprietors. Those French writers who believe that this division has been pushed to a dangerous extent, also frequently employ the expressions *émiettement* (reducing into crumbs) or "pulverisation" (in German *Zwergwirthschaft*).

It is applied both to cultivation and to ownership of land. In the former sense, much naturally depends on the kind of cultivation peculiar to the region, as corn or the vine, and to the opportunities for the sale of produce —as garden cultivation near large towns. Leaving for the moment this aspect of the question, and dealing exclusively with the *morcellement* of ownership, we notice first that it is a mistake to suppose that the existing division of land in France is entirely due, as is often stated, to the operations of the *Code Civil* (articles 815-842), enacting that the children of a deceased landowner are entitled to claim shares of his property equal in value and in kind. As known by all readers of Arthur Young, the number of peasant proprietors in France was large before the French Revolution, the principle of the present laws of succession being then in force for the property of commoners. In a paper read in 1889 before the

International Institute of Statistics, and published in the *Bulletin du Comité des Travaux Historiques et Scientifiques* of the ministry of public instruction for 1890, pp. 98-116, a French statistician, M. Gimel, computed the number of taxed landowners, before the French revolution, consequently excluding the privileged *noblesse*, at four millions. The fact is that the abolition of entails, the confiscation and sale by auction of the *nationalised* estates, and the extension of the equal division of successions, combined to give a powerful impulse to an already existing tendency.

To ascertain the present number of landowners in France, the number of *cotes* or individual "extracts" from the communal rolls of direct taxation on real property has first to be taken; then as the same man often owns land in different *communes*, it is calculated that the number of *cotes* is about twice that of the number of actual proprietors. M. de Foville, the best authority on this subject, estimates the number of owners of real property in France at the following dates as follows:

Before the Revolution. . .	4 millions.
About 1825 . . .	6½ ,,
About 1850 . . .	7 ,,
In 1875	8 ,,
In 1890	from 7½ to 8 millions.

According to the decennial *Enquête* of 1882, out of the total number, 4,835,000 are rural landowners, of whom 3½ millions personally cultivate their own land.

In the agricultural *Enquête* of 1884, a classification based on the extent of land individually owned was included and carefully carried out; it shows the following proportional percentages for very small, small, medium-sized, and large properties.

Land.	Number of *cotes*.	Occupied Area.
	per cent	per cent.
Under 2 hectares (5 acres) . .	74·09	10·53
From 2 to 6 hectares (5 to 15 acres)	15·47	15·26
From 6 to 50 hectares (15 to 125 acres)	9·58	38·94
From 50 to 200 hectares (125 to 500 acres)	0·74	19·04
Above 200 hectares (500 acres) .	0·12	16·23

The number of 10,426,328 *cotes* or "extracts" covering an area of 5,211,456 hectares or 13 millions of acres, is given for the very small properties under 5 acres. This shows that in France small and even diminutive peasant proprietorship certainly exists to a considerable extent. Still it is intermingled with a far larger proportion, in area, of medium-sized and large ownership, and it cannot consequently be maintained that as a rule the land is in a state of "pulverisation." In fact, the majority of these Lilliputian holdings are cottages with gardens annexed; and it will not be foreign to the present subject to state that a recent official inquiry on house property, 1887-1890, has shown that out of a total of 8,914,500 houses and dwellings, 4,969,200 were wholly and 491,100 partially occupied by their owners. There are 36,000 *communes* in all, and it is impossible to find a single house or cottage let to a stranger in more than 2000 of these.

The French legal system of inheritance has found opponents both among the friends and the enemies of small peasant-proprietorship. Among the former must be reckoned LE PLAY and his disciples, who contend that this system defeats itself when the hereditament is too small to be conveniently divided, as, in that case, the property is offered for sale and bought up by investors with capital or rich neighbours, who add their purchases to their own estates. As a remedy, they propose the introduction of the American HOMESTEAD AND EXEMPTION LAWS (*q.v.*). The mere abrogation of the article of the *Code* which enjoins compulsory division in shares of the same *kind*, would probably be more favourably accepted by public opinion. Another objection, which is directed against the *petite propriété* itself, maintains that it leads to neo-Malthusianism amongst French peasants; the *petite propriété*, however, exists on a large scale at the present time in Belgium and in many parts of Germany; both these are countries where the population is increasing rapidly; consequently rural neo-Malthusianism in France cannot be exclusively or even mainly ascribed to the division of land. Besides, in France itself the departments, where population is stationary or decreasing, are not invariably those where the average size of ownership in land is the smallest.

In former time, QUESNAY alleged against the *petite propriété* that it is comparatively less productive than the larger estates owned or farmed by men familiar with the art of scientific cultivation, and in possession of considerable capital. In France this objection is no longer heard much of, as most people believe that the greater energy of the small freeholder amply compensates any inferiority in this respect. This greater energy finds full scope for its exertions in several branches of culture, as vine-growing and market-gardening, to which the soil and climate of France are peculiarly congenial, and which accordingly have spread and prospered there. Moreover, this objection also applies rather to extreme division of cultivation than to extreme division of ownership, and loses much of its weight in practice, because small landowners often farm land belonging to other people and make up thus a fair-sized occupation. However, it cannot be denied that the division of cultivation arising from an excessive separation of property has in many instances and for a long time caused waste, but, where this was or is the

case, the remedy is readily available by mutual exchanges, and by what has been called *commassation* or *remembrements*. From 1860-1890, M. Gorce, a surveyor in Nancy, has thus been empowered by syndicated groups of landowners to redistribute their lands and fields, and has carried out this operation in twenty-five communes of the department of Meurthe and Moselle with such success that the average increment of value of the land thus redistributed has been valued at 500 francs per hectare, or £8 per acre. On the other side of the Rhine, and also in Germany and in Austria, a legal sanction has been granted to *commassation*, and the decision of a majority made binding for the whole local body of landowners; it is stated that two millions of separate and widely dispersed hectares, five millions of acres, have thus been consolidated into groups of connected areas.

Last and by no means least important, it is generally felt on the continent that the existence of a numerous class of very small but independent peasant proprietors is one of the safest bulwarks against the disintegrating influences at work in large closely-peopled centres.

[The standard work on the subject is M. de Foville's *Morcellement*, Paris, 1885. The same author wrote the article "Morcellement" in the *Nouveau Dictionnaire d'Économie Politique*, 1892. All French writers on agriculture from Olivier de Serres downwards, and the physiocrats and economists of the last century, have more or less examined the question. Roscher in his *Nat. Oekonomik des Ackerbaues* (12th ed. 1888, bk. ii. chs. 4 and 11), concludes in favour of a state of equilibrium based on a judicious mixture of large, middling, and small holdings. For the special literature see Morel de Vindé, *Considérations sur le Morcellement*, 1826.—Faucher, *État et tendances de la petite propriété en France*, 1836.—H. Passy, *Essai sur la division des héritages*, 1838.—Piogey, *Du Morcellement du Sol en France*, 1857.—Legoyt, *Du Morcellement de la propriété en France et en Europe*, 1865.—Bretagne, *Étude sur le cadastre et les abornements généraux*, Nancy, 1870.—Gimel, *Division de la propriété dans le département du Nord*, Lille, 1877.—*La Division de la propriété*, 1883.—*Mémoire sur la Division de la propriété avant et après* 1789, 1889.—Lavergne, *Économie rurale de la France*. See also Wolters, *Studien über Agrarzustände in Frankreich bis* 1790, Leipzig, 1905.] E. Ca.

MORE, Sir Thomas (*c.* 1478-1535), was born in Milk Street, Cheapside, in 1478 (Seebohm's *Oxford Reformers*, Appendix C.), or about 1480 (C. More's *Life of Sir Thomas More*, which was published in 1627 according to Lewis and Singer, in 1631 according to Hunter). After being educated under Nicholas Holt, and living as page in Archbishop Morton's household, and learning Greek as well as Latin in Oxford—probably at Christ Church (C. More), Thomas joined Lincoln's Inn 1496; was called to the bar, made reader at Furnival's Inn, and undersheriff of the City of London (1502-1519). In 1505 he married Jane Colte, by whom he had a daughter Margaret, afterwards wife of William Roper his biographer, and two other daughters and one son. As burgess of parliament he defeated Henry VII.'s demand for an aid on the marriage of his daughter (1504), which offence cost his father imprisonment and £100 fine, and drove the offender from the highway of his profession into the quiet bye-paths of historical and literary compositions (*e.g. Historia Richardi III.*; *Epigrammata*, etc.). Under Henry VIII. he returned to the law, and as counsel for the pope beat the king in a case of forfeiture which came before the Star Chamber; which service the defeated litigant rewarded with knighthood, a mastership of requests, and a privy councillorship (Roper's *Life of More*, written about 1557, pub. 1626). About 1521 he was made under treasurer, and in 1523 speaker. As speaker, he defeated Cardinal Wolsey's tyrannous attempt to compel the Commons to discuss in his presence the grant of a subsidy (Roper, confirmed by Hall's *Chronicle*, p. 656; Brewer's *Hist. of Henry VIII.*, 469, misleading); yet the king at this time was a constant though not over-welcome visitor at Chelsea, and Sir Thomas was made chancellor of the Duchy of Lancaster (1526-32). In 1529 he was ambassador to Cambray in order to conclude a league between Francis I., Charles V., and Henry VIII. Henry used at this time to urge Sir Thomas to declare against the papal dispensation which legalised his marriage with his sister-in-law Queen Katherine, and Sir Thomas replied by pointing out authorities opposed to the king's contention (*e.g.* St. Augustine), and by pleading inability to offer an opinion of his own in the matter. On 25th October, Wolsey having fallen, Sir Thomas was made lord chancellor. It was as lord chancellor that Sir Thomas had to inform both houses of parliament of replies from the universities of Oxford, Cambridge, Bologna, etc., declaring the king's marriage void (Gairdner's *Letters and Papers of the Reign of Henry VIII.*, vol. v. No. 171); and he discharged this irksome task without adding views of his own but resigned soon afterwards (16th May 1532), and retired on £100 a year. The clergy subscribed £5000 to reward him for his theological polemics (*e.g. Responsio ad Lutherum*, 1523), but he would not accept a penny from them. Then his persecution began, first for bribery as lord chancellor, then for complicity with Elizabeth Barton, attainted of high treason by 25 Henry VIII. c. 12. Both charges broke down, the first ludicrously, the second ominously, More remarking "quod differtur non aufertur." For the king's "Act of Matrimony and Succession" was even then being passed (25 Henry VIII. c. 22), and section ix. of the act (confirmed by 26 Henry VIII. c. 2) made it misprision of treason not to swear

"to defend all the contents of the act and of every part of it," and the act, besides regulating the succession, which More offered to swear to (*English Works*, ed. Rastell, 1557, p. 1428), declared Henry VIII.'s marriage with Katherine null. Sir Thomas would not swear what he did not believe, and went to the Tower (April 1534), and was deprived of his estates in November (26 Henry VIII. c. 23), (*Archæologia*, xxvii. ; p. 369, *Froude*, ii. 242 misleading). The same parliament of November 1534 enacted that the king should be and have the title of Supreme Head of the Church (cap. i.), and that it was high treason to contrive to deprive him of any of his titles (cap. xiii.). Rich's perjured testimony (which Froude alone believes) brought More within the scope of these two last mentioned enactments. He was tried for high treason on this last charge (1st July) and executed (7th July). Stapleton's *Tres Thomæ* (1589), and perhaps Hall's *Chronicle*, represent More as an ultramontane protagonist, whereas he was an advocate of præmunire (Roper, ed. Singer, 1822, p. 66); Mr. Froude (*Hist. of England*, ii. 395), citing a story of Roper's p. 73) as mistold by C. More (whom he miscalls Sir Thomas's grandson), suggests that More had spoken seditiously against Anne Boleyn, a suggestion never made at the time. Roper, followed by Rev. T. E. Bridgett in his *Life and Writings of More* (1891), says that More refused "an oath of supremacy" which never existed: Lord Campbell (*Lives of the Chancellors*, i. 564), ignoring 25 Henry VIII. c. 22, declares that More's commitment to the Tower was illegal. All these statements and suggestions are erroneous; Sir James Mackintosh's *Life of More* (1831), as supplemented by the actual Indictment and Lady More's Petition (printed in 1838 in *Archæologia*, xxvii. 370) contain the only true and full account.

The character of Sir T. More, as drawn by his trusty biographer Roper (whom Stapleton and C. More only echo and add to) is a classic picture of a perfect gentleman. His even and Socratic temper was never ruffled. The stories about More's cruelties to Protestants, which arose fifty years after his death, and have been lately revived by Froude and the *Dictionary of National Biography* (1894), may be dismissed as fabulous (Bridgett, ch. xiv.). Erasmus was his friend since 1497 (Ep. 14), (Froude, *Erasmus*, pp. 43, 111, etc.), and his description of the Chelsea home, which all the children and eleven grandchildren shared, illustrates the domestic virtue of Sir Thomas as vividly as Roper's picture of the lord chancellor kneeling before his father the judge in the judge's court, and asking a blessing before going to his day's task. So strong and so gentle, so bright and so unworldly, so good a son, and father, and citizen, this saintly lawyer, this incorruptible courtier, this humorous ascetic, this Roman Catholic who died for freedom of conscience at the hands of those who vaunted themselves its champions, strikes our imagination by his singularity as much as he touches our hearts by his simplicity.

More's only famous book is his *Utopia* published in Latin (1516), and translated into German (1524), Italian (1548), French (1550), and lastly by Robynson into English (1551). It begins by arguing, as Lord Campbell says, like Romilly or Mackintosh against indiscriminate severity in the punishment *e.g.* of theft when economical conditions caused theft. Those economical conditions were twofold—(1) the quantity of men "having no craft" as More styles them, and including priests, servingmen (our unproductive workers), gentlemen and noblemen, valiant and sturdy beggars, and most women (our unproductive consumers). (2) Men were being driven into theft by the turning of ploughland into sheep-runs and the consequent clearances. He thought this second tendency could be checked by penal statutes, and that penal statutes were stronger than the economic motive which in those days was called avarice; in this he erred in company with Latimer, Hales, and every writer of the time except W. Stafford (see Cunningham's *Growth of English Industry and Commerce*, 252, 268); the first evil he thought would be palliated by a law prescribing a maximum of wealth, but only cured by doing as in Utopia. Book 2 describes the island of Utopia (*οὐ τόπος* or *εὐ τόπος*, bad Greek for "Nowhere" or "Good Place") which is communistic. In Utopia all produce, except the very learned, who have a licence not to produce; and each producer alternates farm industry with some civic industry like building. As none are idle none are overworked, the normal working day being six hours, not nine hours, as a misprint copied from Robynson's 2nd edition of 1556 (where it is corrected in MS.) into Dr. Arber's, and the Camelot, Kelmscott, and other reprints indicates. Criminals work like *servi pœnæ* on the degraded but necessary tasks of killing animals for food, hunting, and scavengering. These are the only slaves in Utopia. Each has his task to do, and plenty of leisure and pleasure; and the criminal code, which does not apply to beliefs—as "it is no man's power to believe what he list"—is short and plain, so that criminals are fewer than in European commonwealths, which are "nothing but a certain conspiracy of rich men procuring their own commodities under the name and title of the commonwealth." The same rulers punish crime and prescribe tasks; but the latter is their main duty,—the former is easily and soon done. As Prof. Cliffe Leslie remarks, the economics of production always presuppose certain assumptions as to the consumer, a truth which was seen more clearly in the 16th century than by A. Smith and his successors. In More the productive machinery is simplified by assuming perfect and unchanging simplicity of taste in the consumer. Luxuries do not exist; and only implements of iron, which is held in high esteem, and earthenware are in common use. The (elected) king sets an example of sobriety to his subjects, and unlike the pretentious rulers of Bacon's *New Atlantis*—a book founded on *Utopia*—lives like a common citizen. Children are allowed to wear what we miscall "precious stones," but grown-up people spurn these baubles. Gold and silver, which are imported in exchange for the export of surplus products, and which for centuries afterwards were commonly deemed synonyms for wealth, are used in Utopia to fetter criminals or are formed into domestic utensils which shall be nameless, or in case of war are paid to foreign mercenaries. This is the only use for money by dwellers in Utopia; for, somewhat like Fichte in *The Closed Commercial State*, he makes the members of the nations barter with one another, and the nation carry on foreign trade by means of money, thus inverting the usual modern view. Exchange scarcely occasions any difficulty in such a simple state. Each district sends up to the capital statistics of supplies, which are then distributed by the state so as to make each district equal; and the district feeds, clothes, and houses its members. The capital stores up a reserve of supplies sufficient to tide over two years in case of emergency, or exports the residue in return for I.O.U.'s which are only realised when some purpose to which gold and silver are put in Utopia has to be fulfilled. The means of existence are always enough and more than enough for the population, whose numbers are kept down. It was the tendency in those times to think that numbers meant strength (Ingram's *History of Pol. Ec.*, p. 37). But in Utopia no town has more than 6000 families, and no family has more than sixteen members over thirteen years of age, for the families live patriarchally like More. Similarly with the farms. An excess over the prescribed limits means emigration, and emigration may mean war, for this sort of war is lawful. The other details of Utopia scarcely belong to political economy—the glass windows, the garden to each house (a suggestion expanded in Lytton's *Coming Race*, Bebel's *Position of Women*, and Morris's *News from Nowhere* into the identification of town and country), the priests, who are "of exceeding holiness and therefore few," always married, and sometimes female; the artificially-hatched chickens which

run after the men who hatched them; the absence of leagues and lawyers; the common dining-rooms in each street; the houses changed by lot every ten years and so on, somewhat as RUNDALE tenure. But the central conceptions are economic. He anticipates Sir Wm. PETTY in perceiving that wealth is the offspring of labour, and is still more modern in identifying it with necessaries, and he sees that necessaries imply a composite conception, *i.e.*, of what people ought to and do as a fact accept as such. Again the organisation of those who produce wealth with a view to its production with the least possible effort to the producer, and to the avoidance of waste, stamps the work as economical in its plan. His task is of course made easier by the ideal outline to the book; and by the assumption that communism will work. But it must be borne in mind that the ideal outline is filled in with practical details; he for instance alone amongst modern Utopians grapples with the crucial question of punishment; and secondly, unlike his model PLATO and his follower CAMPANELLA his communism is not pursued into family relationships, and those who complain that communism supplies no adequate incentive to work will find this objection raised by More at the end of book i., and the absence of an answer to it adverted to at the end of book ii. So far from being dogmatic, the conclusion of the matter is a note of interrogation. He ends and we end all but convinced. The book belongs more to literature than to science, and uses the actual only to decorate the ideal world. Like his life, the first part of his book grows out of the problems, and hardly rises above the ideas, of his age; the second part vividly reflects his character and takes us back to Plato, but also forward into the 19th century. It belongs to every age.

[J. Bonar, *Philosophy and Political Economy* (1893), pp. 62-67, 69, 290.—*Die Geschichte des Sozialismus*, edited by Bernstein and Kautsky, b. 1, th. 2, absch. 4 (vol. i. pp. 448 *et seq.*).—Diodato Lioy, *The Philosophy of Right*, translated by W. Hastie (1891), vol. i. pp. 262 *et seq.*—*The Dialogues of Plato*, translated by B. Jowett, 3rd ed. (1892), vol. iii. pp. ccxvii.-ccxxxi.—H. Morley's reprint of *Utopia*, Bacon's *New Atlantis*, and Campanella's *City of the Sun*, etc., entitled *Ideal Commonwealths* (1885).—*Voyage en Icarie*, by CABET (*q.v.*) (1840), which is an expansion of More's *Utopia*, but modifies several details, *e.g.* expulsion and not slavery is the penalty of idleness. The Nauvoo community formed in Illinois (1849) on the model of Cabet's book, was shifted to the banks of the Nodaway, Iowa (1860), and split into two parts (1879); the only prosperous part (Icaria-Speranza in California), consisted of fifty-two persons, but gradually reintroduced private property in 1883-84, and expired soon after. The other part was dying in 1883. Still, this is the most successful non-religious experiment in communism.—Dr. Albert Shaw, *Icaria* (1884), pp. 123, 147.—Dr. H. Lux, *Etienne Cabet und der Ikarische Communismus* (1894), p. 266.—For More's views on money cp. A. Smith, *Wealth of Nations*, iv. i., para. 4.] J. D. R.

MOREAU, CÉSAR (1791-1829):

French vice-consul in London, the founder of the *Société française de Statistique Universelle*, published numerous statistical works on French and English navigation in modern times enumerated in the (old) *Dictionnaire d'Économie Politique* and in Guérard, *France Littéraire*, 1834, vol. vi. p. 294. E. Ca.

MOREAU DE BEAUMONT, J. L. (1715-1785).

Successively councillor in the Paris parliament, master of requests and *Intendant des Finances*, was author of *Mémoires concernant les Impositions et Droits en Europe*, 4 vols. 4to, 1768-69, 2e éd., avec des Suppléments, 5 vols. 4to, 1787. The second and third volumes deal with France; in the preface of vol. i. the author expresses the opinion that in France uniformity of taxation "could alone put an end to the evils which were experienced, but that it is easier to see and feel the ills than to apply the remedy." Moreau's *Mémoires* (published anonymously) are mainly descriptive and considered to be authoritative on the subject as far as France is concerned.

[The reference to this work in A. Smith's letter to Mr. Sinclair, printed in Bonar's *Catalogue of the Library of A. Smith* (Macmillan, 1894), shows the writer's appreciation of it. A. Smith describes himself as having "frequent occasion to consult the book himself, both in the course of his private studies and in the business of his present employment (as Commissioner of Customs), and is therefore not very willing to let it go out of Edinburgh." He obtained it "by the particular favour of Mr. Turgot, the late Controller-General of the Finances. I have heard but of three other copies in Great Britain. . . . If any accident should happen to my book, the loss is perfectly irreparable." There are several quotations from Moreau de Beaumont in the *Wealth of Nations* referring principally to taxation in other nations of Europe. The use Adam Smith made of the book is a good illustration of his method of study and investigation, and the pains he took to master every detail of his subject. See also Stourm, *Dict. Hist. des Finances*, 1895, p. 25, who complains of the undue importance given to secondary matter.

Cunningham, *Econ. Jour.*, No. 1, vol. i., maintains that A. Smith's canons of taxation were largely derived from Moreau de Beaumont.] E. Ca.

MOREAU DE JONNÈS, ALEXANDRE (1778-1870), born at Rennes, died at Paris. A distinguished statistician, left many works important in their time, but now out of date. He volunteered as a soldier when fourteen years of age, was a prisoner in England from 1809 to 1815, and after the conclusion of peace devoted himself to statistics.

Thiers, minister of commerce, in 1834 appointed Moreau head of his statistical department, which through the periodical reports issued by him soon became one of the most important branches of the office. He continued this duty till 1852. Under his direction twelve huge quarto volumes were published in 1837 at the beginning of the second inquiry, which work, or at least the plan of it, may be considered as his. Besides this official collection, and not including his labours on physical science, the following works of his may be mentioned:—

Le commerce au XIXe siècle, 2 vols. 8vo, 1827.—*Statistique de l'Espagne*, 8vo, 1834.—*Statistique de la Grande Bretagne et de l'Irlande*, 2 vols. 8vo, 1838.—*Recherches statistiques sur l'esclavage colonial et sur les moyens de le supprimer*, 8vo, 1841.—*Éléments du Statistique*, 8vo, 1st ed. 1847, 2nd ed. 1876.—*Statistique de l'agriculture de la France*, 8vo, 1848.—*Statistique des peuples de l'antiquité*, 4 vols. 8vo, 1871.—*La France avant ses premiers habitans*, 16mo, 1876.—*Statistique de l'industrie de la France*, 16mo, 1876. A. C. f.

MOREL VINDÉ, CHARLES GILBERT, Vicomte de (1759-1842), a peer of France and member of the academy of science and royal society of agriculture, was a frequent writer on economic and agricultural subjects.

Considérations sur le morcellement de la pro-

priété territoriale en France, 8vo, 1826.—*Sur la théorie de la population*, 2nd ed. 8vo, 1829.

[A complete list of his works will be found under his name in Quérard, *La France Littéraire au 18me et au 19me siècle*, Paris, 1834.] E. Ca.

MORELLET, Abbé André (1727-1819), born at Lyons and died at Paris. Though an economist, he was not a physiocrat, inclining rather to the opinions of Gournay than to those of Quesnay, though always respectful to the latter.

He was by conviction a persistent partisan of freedom in economic matters, though he wrote no dogmatic work, but was constantly engaged in polemics attacking monopolies and privileges with arguments derived from practice. Hardships marked his youth. His father, a stationer in a small way, treated him with severity. There were thirteen brothers and sisters in the family. He early left his home and joined the Jesuits, from whom he received his first education. Persevering work and a bright intellect gained him admittance to the Société de Sorbonne, a private society endowed for the gratuitous reception of the deserving, no preference being shown to people of fortune or rank. He there became acquainted with many who afterwards became famous, the most illustrious of whom was Turgot. Like Adam Smith he had charge of the education of a young man of a wealthy family, to whose care he devoted ten years, five being at the Collège de Plessis. He raised both the standing and the numbers of that institution through his knowledge of the men of mark at that time, including a few foreigners, principally Italians.

Morellet discovered in a library at Rome a book on the legal practice of the church, written by an inquisitor of the 14th century. He made extracts from it, the outcome of which was the *Manuel des inquisiteurs*, which, in his time (1762), made a great stir. Voltaire was delighted with the book, and thenceforward held Abbé Morellet in high esteem, and amused himself by calling him Abbé *Mords-les*, because of his sarcastic and incisive style.

Morellet's first economic work was *Réflexions sur les avantages de la libre fabrication et de l'usage des toiles peintes en France*, 12mo, 1758. The object was to secure freedom for the industry referred to in the interior of the country. Morellet did not go so far as to ask for free import of foreign goods. Probably he stopped lest he should alienate the *Compagnie des Indes*, with whom he was not yet prepared to quarrel. In the narrow limits of his *Mémoire* he gained a complete success. He introduced into France the most important work of Beccaria by a translation still in common use. Its appearance two years after the publication of the work itself (*Dei Delitti e delle Pene*) assisted in abolishing torture in France, partially in 1780, and completely nine years after.

Morellet's great triumph was the suspension of the privileges of the *Compagnie des Indes*, on 13th August 1769, in consequence of his *Mémoire sur la situation actuelle de la Compagnie des Indes*, Juin 1769. Necker, at that time only a clerk in a Swiss bank, took up the defence of the company in the form of a reply to Morellet.

The conflict with privileged commercial companies recommenced on the renewal of the monopoly of the Indian trade, to the advantage, if indeed it can be said to the advantage, of a new company in 1785. The impetuous Abbé wrote again in 1787, and re-edited the *Mémoires relatifs à la discussion du privilège de la Compagnie des Indes*, besides publishing a reply to Abbé d'Espagnac, the well-known stock-jobber of the 18th century.

The same year in which he was drawn into the controversy with the Indian company he published the *Prospectus d'un nouveau dictionnaire du commerce*, 8vo, a dictionary upon which he worked twenty years and then gave up. Peuchet profited by his work in his *Dictionnaire universel de géographie commerçante*, 5 vols. 4to, 1799-1800 (years vii.-viii.).

The translation by Diderot into French of the *Dialoghi sul commercio dei grani* of Abbé Galiani (*q.v.*), appeared in 1770. Morellet quickly took up his pen in the cause of freedom in the export trade. Unfortunately, error was more attractive than the plain truth, and with the public the Neapolitan Abbé had more success than his French fellow-economist. Morellet again took up arms for the same cause, this time against a writer whose celebrity was yet only dawning, though he had already crossed swords with him. Necker, in *La législation et le commerce des grains*, 8vo, 1775, argued against free trade. In an analysis of this work published in 8vo, 1775, Morellet showed all its weak points from the economic side. Again this time the victory was against Morellet.

The Revolution now commenced. It may well be believed that the Abbé did not lay down his pen, but with the exception of a refutation of a book on, or rather against, property, 1792, by the Girondin Brissot, who, anticipating Proudhon by half a century, held the opinion that property was robbery (*la propriété c'est le vol*), the works of Morellet at this date were political and literary. He died at the commencement of the restoration, aged ninety-two, not of old age, but by an accident. He was still in full possession of his mental faculties. Morellet's translation into French of the *Wealth of Nations*, though apparently carefully made, was never printed, see John Rae, *Life of Adam Smith*, 1895, p. 359. He mentions in his *Mémoires* that he met Adam Smith in Paris, and discussed free trade, banking, etc. with him, and that A. Smith spoke French very badly.

[Lavergne, *Les Économistes du xviiie siècle.*] A. C. f.

MORELLY. Nothing certain is known of Morelly's life, except that he was born at Vitry-le-François, and was a teacher there. His works would have been as little known as he was, had it not been for the socialists who have extolled the communistic opinions they contain.

The first: *Le Prince, les délices du cœur, ou Traité des qualités d'un grand roi et système d'un*

sage gouvernement, 1751, 2 vols. 12mo, is entirely political, and describes in its different parts the duties of an absolute monarch.

The second: *Naufrage des îles flottantes ou la Basiliade de Pilpaï; poème héroïque traduit de l'indien*, 1753, 12mo, is a story in which the author declaims on the return to the state of nature in opposition to the state of civilisation. In his next work the author speaks modestly of this poem "as new in its subject as in the construction in which truth is reclothed in all the graces of epic poetry."

The third and last is: *Le Code de la nature ou le véritable esprit de ses lois, de tout temps négligé, méconnu*, 1758 and 1760, 12mo. This book, wrongly attributed to Diderot, is written in a dogmatic form. Property is abolished except in the case of things for personal use. The state supplies work and living to all, the first according to talents, strength, and age, the second according to needs. Inconsistently, like many communists, he is in favour of family life and marriage. Fourier has borrowed a great deal from Morelly. A. C. F.

MORGAN, AUGUSTUS DE (1806-1871), born at Madura, Madras, was the son of Colonel De Morgan and descended on his mother's side from James Dodson the mathematician. In 1823 he entered Trinity College, Cambridge, and came out as fourth wrangler in 1827. He was the first occupant of the chair of mathematics at University College, London, and held it for more than thirty years.

In 1838 De Morgan published his *Mathematical Treatise on the Theory of Probabilities*, and, subsequently, an *Essay* on the same subject, with especial reference to their *Application to Life Contingencies and Insurance Offices*. In 1847 appeared his *Formal Logic*, while from 1841 till shortly before his death he was closely occupied with the question of a *Decimal Coinage*.[1]

He proposed to make the change a very gradual one, by introducing *the royal*, a tenth of a sovereign, our florin, with its half and quarter, our shilling and sixpence. He then proposed to get the decimal part of this *royal* in the *groat*, a coin worth about 2½d., the tenth part of which would be approximately a *farthing*. A. L.

MORGAN, WILLIAM (1750-1833), nephew of Dr. PRICE (*q.v.*), whose works he edited with a memoir, occupied, as actuary to the Equitable Insurance Society (1775-1830), a leading place among the pioneers of life insurance. The aim of Morgan's financial pamphlets was to show that the war expenditure had added so enormously to the national debt that "if the same unexampled dissipation of the public treasure be continued much longer, it must inevitably terminate in bankruptcy and ruin."

His works include:—*The doctrine of annuities and assurances on lives and survivorships stated and explained*, London, 1779, 8vo.—*A Review of Dr. Price's writings on the subject of the finances of this Kingdom*, London, 1792, 8vo.—*Supplement* to above, London, 1795, 8vo.—*Facts respecting the expense of the War*, 4th ed. London, 1796, 8vo.—*An appeal to the people of Great Britain on the present alarming state of the Public Finances*, 3rd ed. London, 1797, 8vo.—*A comparative view of the Public Finances from the beginning to the close of the late Administration*, 3rd ed. London, 1801, 8vo.—*Supplement* to above, London, 1803, 8vo.—*A view of the rise and progress of the Equitable Society*, London, 1828, 8vo.

[For Morgan's actuarial work consult Walford's *Insurance Cyclopædia*, vol. ii. pp. 596-622, and vol. iii. pp. 5-7, for biographical details, *Dictionary of National Biography*, vol. xxxix. p. 40, and authorities there given.] H. E. E.

MORHOF, DANIEL GEORG (1639-1691). In his *Polyhistor* (published 1688) Morhof deplores that economics, which are nearly connected with political science, have been left to the care of *illiterati* and have not undergone a thorough scientific investigation, although they are the foundation of the well-being of the whole state. The means by which domestic wealth is increased and preserved ought to be closely examined, for "the preservation of economic wealth through a clever management is the basis of the entire science of economics and chrematistics." He recommends his readers to consult the books written by travellers, and is a great admirer of the internal administration of France.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 328-329.] E. Ca.

MORPURGO, EMILIO (1836-1889), born in Padua, an able economic writer. He took part in politics, was a deputy, general secretary of public instruction, and devoted to practical problems in Italian economics, finance, and instruction. He also occupied himself with science and instruction, and filled, with much distinction, for many years, the chair of statistics in Padua. Amongst his practical works, his *Report on the Condition of the Peasants and Agriculture in the Venetian Provinces*, made on the occasion of the agrarian inquiry, takes a

[1] De Morgan bestowed a vast amount of unrewarded time and trouble on the propaganda of views in favour of a reform of the English system of money to a decimal system of currency and notation. He laboured incessantly with this view by giving evidence before parliamentary committees, in lectures to various scientific bodies, and in the Decimal Association (vide article DECIMAL SYSTEM). The particular method he advocated was the "pound and mil" scheme, retaining our pound sterling and subdividing it into 1000 instead of, as at present, 960 farthings. De Morgan may be fairly said to have been, taken all round, one of the best appreciated and esteemed men of his position in the past generation. In tuition and in literary matters, his versatile aid and almost boundless store of information were liberally given. Painstaking and minute research was his strong point. He had lost the sight of one eye in infancy. The strain upon the remaining eye, involved by his constant industry in accumulating stores of knowledge, must have been severe. The writer once had occasion, in a letter to him, to mention one of the Bernoulli family of mathematicians of the last century, and spelt the name wrongly, that is with two i's, Bernouilli. "Oh," replied De Morgan, "you have deeply offended me. Pray always keep in mind the personal interest I take in one-eyed philosophers." F. H.

high place. This work is a model of its kind for method, for accuracy, and the ideas embodied.

Morpurgo studied the practical problems of finance and the organisation of technical instruction in Italy. His scientific activity was chiefly applied to statistics, on which subject he has left deep traces by his remarkable studies of demographic, financial, and moral statistics, and also in his historical and theoretical researches. His most important work in this branch of study is a volume on statistics and moral sciences, in which he collects and states the principal results of modern statistical research. We note among Morpurgo's writings: *La statistica e le scienze morali*, Florence, 1872.—*L'istruzione tecnica in Italia*, Rome, 1874.—*La finanza*, Rome, 1876.—*Le condizioni dei contadini e le condizioni della proprietà e dell' economia agraria nel Veneto*, in the "Atti dell' Inchiesta Agraria," vol. iv., fasc° 1 and 2, Rome, 1882-83. U. R.

MORRIS, CORBYN (d. 1779), writer on fiscal subjects, held various posts in the public service in Scotland and in England, and was an upholder of the mercantile theory. He attracted attention by a pamphlet entitled *A Letter from a Bystander to a Member of Parliament*, in which he examines the economic basis of the crown. This letter provoked a sharp controversy in print: replies and counter-replies embody "much curious discussion and information with respect to taxation and the expenditure of the public revenue for a lengthened period" (M'Culloch, *Lit. Pol. Econ.*, p. 328). Morris also urged the impolicy of England's insuring the ships of a nation (*i.e.* France) with which she was at war: his papers on this subject carefully examine the arguments on the other side, and hypothetical problems are worked out in detail. In his *Essay* on Insurance, the author candidly states that in working out the subject he started not from ascertained facts but from reflections of his own, and that these last did not accord with the views of "a very ingenious and worthy merchant" to whom he had communicated them. The reader is to expect "no information concerning what are the present customs . . . but . . . an endeavour to establish the just maxims . . . upon a fair open footing of reason and equity." He adds that in working out insurance problems he soon found, as was not unnatural in a Cambridge man, that "without the aid of some higher calculations," *i.e.* of mathematics, "all must be left unsettled and loose, and bounded by general guesses." Hence his problems are stated and worked quite on mathematical lines. In 1751 he published some vital statistics concerning London, and a little later urged the establishment of a national registry-general of the population, and of the annual proportion of births to deaths. His statistical work on London was reprinted and brought nearly up to date in 1759. The scarcity of silver coin in England at that time also attracted Morris's attention, and by working out the respective values of existing gold and silver coin as bullion, he arrived at the conclusion that silver was scarce in England because the existing proportion of pure gold to pure silver was as $1 : 15\frac{2}{3}\frac{8}{5}\frac{5}{4}\frac{9}{5}$, whereas in the other chief trading countries of Europe it was as $1 : 14\frac{1}{2}$; and that there was consequently a temptation to export silver abroad, the gross profit upon 100 lbs. troy weight of gold being some $40\frac{1}{2}$ per cent. The remedy, in Morris's eyes, was to alter the English ratio of gold to silver to the continental figures. His plan for account-keeping on landed estates grew out of his own need of something better than his steward's rather haphazard method of checking rents, etc.

The following works seem all to have been published in London:

A Letter from a Bystander to a Member of Parliament, wherein is examined what Necessity there is for the Maintenance of a large regular Land-force in this Island, etc., London, 1741-42, 8vo.—*An Essay towards illustrating the Science of Insurance, wherein it is attempted to fix, by precise Calculation, several important Maxims upon this Subject*, etc., 1747, 8vo, pp. xv. 61.—*An Essay towards deciding the Important Question whether it be a National Advantage to Britain to Insure the Ships of her Enemies; addressed to the Rt. Hon. Henry Pelham*, 1747, 8vo, pp. 50; the impolicy and illegality of the practice are clearly shown; 2nd edit. 1758, pp. x. 34.—*Observations of the Past Growth . . . of the City of London*, 1751, fol.—Ditto reprinted, and with statistics to the end of 1757, 1759, 4to.—*A Letter balancing the Causes of the present Scarcity of our Silver Coin, and the Means of immediate Remedy, and future Prevention of this Evil*, 1757, 8vo, pp. 20.—*A Plan for Arranging and Balancing the Accounts of Landed Estates*, 1759, fol. pp. 39.

[M'Culloch, *Lit. Pol. Econ.*, pp. 243, 272, 327.—*Dict. Nat. Biog.*, art. "Morris, Corbyn."] E. D.

MORSTADT, EDUARD (1792-1850), professor at the university of Heidelberg, lectured on economics, finance, and law, and founded, in 1834, a monthly paper, *Der Nationalökonom*, of which he remained the editor until the end of the following year.

Morstadt published a German translation of Say's *Cours d'Économie Politique*, with an introduction in which he defines political economy: "a science whose real object must not be to dictate oracles to her high priests when sitting under their nocturnal lamp, but is to become the confidant of princes, the teacher of nations, and the interpreter of universal history." A supporter of free trade and an opponent of restrictive legislation of labour, he was very fond of delivering himself of curious economic definitions (see under his name, Prof. Conrad's *Handw. der Staatswiss.*, iv. p. 1230), and of editing other writers' works with critical notes; on the occasion of such an edition

of Klüber's *Public Law of the German Confederation*, he was most unmercifully handled by Robert von Mohl, his colleague and former contributor. His own contributions to the *Nationalökonom.* are all very short; his analysis of the three possible courses of action which a government is able to follow with regard to population, is given in the already mentioned article of Professor Conrad's *Handwörterbuch.* E. Ca.

MORTGAGE (= *dead pledge* — as distinguished from *vif gage* = living pledge, *i.e.* a pledge taken into the creditor's possession and producing income which gradually pays off the debt) is the name of a security given by a debtor on property remaining in his possession—the hypotheca of Roman Law—and thus differing from a security on property handed over to the creditor, which is described by the name of "pawn" or "pledge," the *pignus* of Roman law. In the case of a "legal mortgage" the legal ownership is expressed to be conveyed to the creditor, on condition that on repayment of the debt before a certain date, it is to be reconveyed to the debtor, but, owing to the influence of the equitable doctrines introduced by the Court of Chancery, the debtor's right to redeem —generally called the Equity of Redemption —continues, although the date for repayment has elapsed and cannot be taken away except by an order of the court (called a Foreclosure order) which is not made absolute for some time.

In the event of the mortgagor not complying with the conditions of the mortgage there are other remedies open to the mortgagor besides foreclosure. He may, unless the mortgage deed contains any stipulations to the contrary, sell the property, or have a receiver of the rents and profits appointed, or he may enter into possession, and he may also enforce the debtor's personal liability to pay the mortgage debt.

Mortgages of land and houses occur most frequently, but mortgages of debts, reversionary interests, life policies, and other "choses in action" are also very common. Mortgages of chattels being deemed bills of sale (see Bill of Sale), are void if they are intended to secure a debt of less than £30, and must in other cases conform to the statutory rules as regards form and registration.

An "equitable" mortgage is a transaction which in certain events entitles the mortgagee to the execution of a legal mortgage, and practically entitles him to all the remedies open to a legal mortgagee. There is, however, this difference, that a "legal" mortgagee having no notice of a prior charge at the time of lending the money, has the first right on the security, whilst the priorities between "equitable" incumbrances depend entirely on the order in which the respective advances were made. The most common instance of an equitable mortgage is a mortgage by "deposit of title deeds" which is deemed to be an agreement on the part of the mortgagor to execute a legal mortgage whenever called upon to do so.

A "submortgage" is the mortgage of a mortgage debt and of the securities relating to the same; a "contributory" mortgage is a mortgage by several mortgagees, each being entitled to an aliquot share of the mortgage deed.

[As to Mortgages by Companies, see Debenture. Coote, on *Mortgages.* — Ashburner, on *Mortgages.*] E. S.

MORTGAGE BANKS. Banks and other public institutions whose only business it is to lend money on mortgage, are much more common on the continent than in England—Germany being the country in which they have attained the greatest importance. They may be divided into three classes: (1) Mutual associations of landowners (*Landschaften, Kreditvereine,* etc.); (2) Mortgage institutions administered by government, or provincial or other local authorities (*Landes Kreditkassen, Provinzialbanken,* etc.); (3) Ordinary joint-stock banks.

The first landowners' association was established in Silesia by Frederick the Great, soon after the end of the seven years' war (1756-1763), which caused much distress in that province. The large landowners of the province were compelled to join it, and they were all jointly and severally liable for the mortgage bonds (*Pfandbrief*) issued by the association. Every member was entitled to raise loans on mortgage up to a certain amount, the borrower receiving mortgage bonds instead of money. It was, however, easy to dispose of their bonds, as owing to the excellent security which they gave to the holders they soon became a favourite investment.

No profit was to be made on the transactions of the association, the interest on the mortgages being only slightly higher than the interest on the bonds, so as to allow for expenses of management. The supreme control of the association was exercised by a government commissioner—generally by the governor of the province.

The success of the Silesian association soon led to the formation of other similar ones in other Prussian provinces, and, in course of time, associations of peasant proprietors were founded in some places on analogous principles. There are now nineteen such associations in Prussia, among which the one for the province of Schleswig Holstein, founded in 1882, is the youngest, and there are four in other parts of Germany. Outside of Germany they exist in Austria-Hungary, and, in a modified form, in the rural parts of the canton of Zurich (*Garantiegenossenschaften*).

(2) The above-mentioned associations are mainly adapted for loans to large landowners, whose joint credit is sufficient to enable them to issue their bonds at a relatively low rate of interest; the peasant proprietors' associations do not have the same advantages, and are only available in limited areas. For this reason the intervention of government and local authorities was generally felt as a necessity, more especially in those parts of Germany where it is customary for one son to

take over the father's property, and to pay a money compensation to his brothers and sisters for their share in the estate. The first impulse to the institution of state establishments for the purpose of granting loans to landowners was given by the legislation for the compulsory enfranchisement of land subject to manorial rights, which in most parts of Germany, though initiated at the beginning of the present century, did not become effective till about 1850. In order to facilitate the payment of compensation to the lords of manors, loans were granted by the state governments or provincial governments on the security of the enfranchised land, and this led to the establishment of a regular system of government mortgage banks. Such banks exist in many parts of Prussia and other parts of Germany, and the total amount advanced by them in 1889 amounted to about 418,000,000 marks (21,000,000 sterling). Most of the loans granted by these institutions are repayable by yearly instalments. A curious combination of government and private agency exists in Mannheim, where the *Rheinische Hypothekenbank*—an ordinary joint-stock bank,—has a separate department for loans on agricultural property, which by virtue of a convention with the government of the grand-duchy of Baden must be carried on without profit, and is under government supervision. Government banks also exist in Austria and Russia.

In the United Kingdom advances by public authorities on land occur in various manners. The advances under the Irish Land Purchase Acts and the Irish Land Act 1903 (see LAND LEGISLATION, IRISH) are for purposes similar to those for which the German state loan institutions were originally established; the public works' loan commissioners are entitled to advance money on the security of land for the purpose of constructing dwellings for the working classes (Housing of Working Classes Act, 1890, § 67), and the provisions of the Small Holdings Act, 1892, under which county councils are empowered on the sale of any small holdings to allow part of the purchase money to be paid by instalments, and in the meantime to be charged on the land, also require to be mentioned in this connection.

Special facilities have been given in continental countries as well as in the United Kingdom for loans in respect of the improvement and drainage of land. In Germany, special banks (*Landesculturrentenbanken*) were instituted either as government establishments, as in Saxony, Bavaria, and Hesse, or under the provincial authorities. Loans granted for these purposes are in most cases specially secured and are repayable by fixed instalments.

In England and Scotland advances may be made out of public funds with the sanction of the board of agriculture, and are secured by terminable rent-charges by means of which the capital is paid off in twenty-two years. Such rent-charges may be created notwithstanding any settlements or entails (see the Public Money Drainage Act, 1846, and the amending acts). Similar powers are given to the commissioners of public works in Ireland by the Landed Property Improvement (Ireland) Acts.

(3) The authorities and institutions mentioned under the two first heads make their advances for public purposes and not with any view of profit, but there are numerous establishments, partly competing with them, and partly supplementing them, which are in a position to make advances on terms not less advantageous than they, and yet are able to pay dividends to their shareholders. The first mortgage bank was established in Stockholm in 1668, but its example does not seem to have been followed at the time; 1835 a *Caisse hypothécaire* was formed in Brussels, but the first institution formed on the modern system (viz. that of a share company issuing debentures for an amount corresponding to the amount of the mortgages held by it) was the *Crédit foncier de France*, founded in 1852 under government supervision. In Germany a number of banks on the same system were formed after 1860: the Bavarian Mortgage Bank was founded in 1834, but did not begin to issue debentures till much later. The capital of these banks at the beginning of 1891 amounted to 332 million marks (£16½ million), and the debentures issued by them to over 3000 million (£150 million). Their 3½ per cent debentures are generally quoted over par. There are also such mortgage banks in Austria-Hungary, Switzerland, and Italy. In the latter country a new privileged institution was founded in 1890 (*Istituto italiano di credito fondiario*). The Argentine mortgage banks, and more especially the provincial ones, are but too well known in this country.

In the United Kingdom it had been expected that the Mortgage Debenture Act of 1865, and the Mortgage Debenture (Amendment) Act of 1870 (28 & 29 Vict. c. 78; 33 & 34 Vict. c. 20) might assist landowners, and on the other hand provide sound investments for capitalists; but the result was very disappointing. The acts provide that the securities upon which debentures issued under their authority may be founded are to belong to certain special descriptions, and are to be deposited and registered in the office of land registry, and to be accompanied by a statutory declaration of a surveyor as to the value of the mortgaged properties, and contain other safeguards in favour of the debenture holders, but the precautions imposed have not proved very effective, and the only important company which availed itself of the provisions of the acts in question was recently compelled to go into liquidation.

The question as to the economical advantages and disadvantages of the various forms of mortgage banks cannot well be discussed in general terms, as the answer depends on the local circumstances, of which there is an infinite variety. The great danger of special facilities for mortgaging land arises in times of inflation, when they multiply the opportunities for reckless gambling; on the other hand it is an advantage that there should be special financial institutions for the purpose of making advances on real property, as it is clearly not within the province of ordinary banks to lock up any substantial part of their funds in such advances.

Where there are numerous small holders, the intervention of the public authorities is almost a

necessity, as it would not pay establishments carrying on business on strictly commercial principles to lend small sums except on very onerous terms.

[As to continental mortgage banks, see Buchenberger, *Agrarwesen und Agrarpolitik*, ii. 97-190. —Hecht, *Die Staatlichen und provinziellen Bodenkreditinstitute in Deutschland*; and the same author's articles, "Landschaften," and "Hypothekenaktienbanken," in *Handwörterbuch der Staatswissenschaften*.] E. S.

MORTGAGE BOND. Bonds issued by a railway or other corporation are sometimes secured by the mortgage of some particular assets or assigned property. American railroad companies have floated a great number of mortgage bonds on the London market, besides some income bonds. The latter are practically preference capital; they are not secured by mortgage, and the interest for each year is payable out of the income of that year only. A. E.

MORTGAGE DEBENTURE. A debenture secured by a mortgage of property. The use of the word does not, however, in itself give any rights to the holder, and may therefore in many cases be misleading (see DEBENTURE). E. S.

MORTGAGEE. A creditor secured by a MORTGAGE (*q.v.*) of property. E. S.

MORTGAGES, REGISTRATION OF. The compulsory registration of mortgages in a public register is much more universal than the registration of land or deeds affecting land generally (as to which see LAND REGISTRATION). Thus in many places mortgages of land are not effective unless registered, although there is no similar requirement as regards transfers of property (*e.g.* the Argentine Republic). The reason for this is that the publicity of mortgages is desirable to avoid disputes as to title, and to prevent people obtaining credit by the apparent ownership of property not really available for their general creditors. As in England mortgages may be effected of movable property as well as of land, a safeguard was required for the former, and this explains the reason of the statutes requiring the registration of a BILL OF SALE (*q.v.*), which, however, exclude the bills of sale of limited companies. A mortgage granted by a company is void against the liquidator and any creditor of the company, unless registered in the prescribed manner (Companies Act 1900, § 14). A mortgage of land registered under the Land Transfer Acts 1875 and 1897 is ineffectual unless protected by the registration of a charge, or of a caution or restriction, or by the deposit of the land certificate.

[Morris, *A Summary of the Law of Land and Mortgage Registration*, 1895.—Reports on the systems of registration of title in Germany and Austro-Hungary, 1896 (c. 8139); and 1897 (c. 8319).—Jennings and Kindersley, *Land Registration under the Land Transfer Acts 1875 and 1897* (1904).] E. S.

MORTGAGOR. A debtor who charges property by way of MORTGAGE (*q.v.*). E. S.

MORTIMER, THOMAS (1730-1810), a voluminous author and compiler, the merits of whose work cannot quite be taken at his own valuation, was appointed in 1762 English vice-consul to the Austrian Netherlands, with the promise, according to his own statement of the reversion of the consulate. The story of his wrongs is told at length in the *Remarks on the case of T. Mortimer*, 2nd ed., London, 1770, 8vo. In 1765 he translated Necker's work *On the Administration of the finances of France*, 3 vols., 8vo. Mortimer's most important work, the *Elements of Commerce, Politics, and Finance*, 4to, in three treatises on these important subjects, designed as a supplement to the education of British youth after they quit the public universities or private academies, appeared in 1772. On the BALANCE OF TRADE (*q.v.*), Mortimer claims to have originated the theory that it depends on the amount of the total commerce carried on to all quarters of the world. The portion on finance, while strenuously combating "idle notions of refunding the capital" of the national debt, contains some acute criticism of Dr. Price's views on a SINKING FUND (*q.v.*). In an advertisement, prefixed to a reprint of the book in 1780, Mortimer roundly accused Adam Smith of having plagiarised from him, and claims that the *Elements* had helped to put a stop to fictitious insurances at Lloyds, and had suggested to Lord North the taxing of certain luxuries, and to Lord Beauchamp his bill for the prevention of arrests for debt for sums under £10. The *Elements* exhausted Mortimer's attempts at original work; for the rest of his life he was busy with work for the booksellers. In his old age he complained to Isaac Disraeli of the hardships of his position.

Among Mortimer's other works were: *Every man his own Broker, or a Guide to Exchange Alley*, London, 1761, 12mo, 13th ed., 1801.—*The Universal Director*, London, 1763, 8vo.—*Dictionary of Trade and Commerce*, 2 vols., London, 1766, 4to.—*Student's Pocket Dictionary*, London, 1777, 12mo.—*General Commercial Dictionary*, London, 1810, 8vo.—*A Grammar illustrating the Principles of Trade and Commerce*, London, 1810, 12mo.—*Nefarious practice of Stock-jobbing unveiled*, London, 1810, 8vo.

[*European Magazine*, vol. xxxv.—*Dictionary of National Biography*, vol. xxxix.—M'Culloch's *Literature of Political Economy*, pp. 52, 53.] H. E. E.

MORTMAIN. Under the feudal system the lord who had a corporation for tenant was under considerable disadvantages. His tenant could not die, could not marry, be a minor, or commit a felony: thus a great part of the lord's profits were taken away. In addition to this, the great religious corporations, such as the templars, held royal charters granting them further immunities. The matter was made worse by a

practice which grew up during the 12th century: a tenant would alienate his land to a monastery and be received back as a tenant of the monastery, thus depriving his original feudal lord of his rights. This last process was declared illegal by the great charter of 1217. A clause of the abortive provisions of Westminster, A.D. 1259, which was re-enacted in the statute De Viris Religiosis, generally known as the Statute of Mortmain, in 1279, made all alienations to the church illegal, whether made in FRANKALMOIGN or otherwise, without the lord's consent. According to later statutes an inquisition, *ad quod damnum*, had to be held, and it was only after this inquisition had shown that neither the king nor any one else would suffer loss thereby, that an alienation to the church was allowed. Apparently it was not till near the end of the 14th century that it was discovered that any corporation was as bad a tenant as the church; for it was not till the statute of 15 Richard II., A.D. 1391, that alienation to any corporate body was subjected to the same laws as alienation to the church.

[*Statutes of the Realm.*—Pollock and Maitland, *History of English Law*, Cambridge, 1895.]

A. E. S.

MORTON'S FORK.[1] This was a dilemma devised by Bishop Morton, chancellor under Henry VII., afterwards cardinal and archbishop of Canterbury, to swell the contributions to a Benevolence (see BENEVOLENCES), levied for a proposed war with France (1491). A clause was inserted in the instructions to the commissioners: "That if they met with any that were sparing, they should tell them that they must needs have, because they laid up; and if they were spenders, they must needs have, because it was seen in their port and manner of living."

[Bacon, *History of the Reign of King Henry VII.* (ed. Lumby), p. 93.] R. L.

MOS (custom). "Jus quod moribus constitutum est" is customary law, which is opposed to "lex" statute law (see Smith's *Dict. of Antiquities*, art. Jus). E. A. W.

MÖSER, JUSTUS (1720-1794) was born at Osnabrück, where his father held a high legal office. He studied at Jena and Göttingen from 1740 to 1742, and, afterwards practising as an advocate in his native place, won the esteem and confidence of his fellow-citizens, which he retained in several important public positions which he filled.

ROSCHER, who declares *him*, and not Hugo or Schlosser, to have been the father of the historical school of law—a judgment which is, however, not generally accepted,—pronounces him also the greatest German political economist of the 18th century, and this on the ground of his possession of the following qualities:—(1) his open sense, equally for the higher social facts and for the homely every-day life of communities; (2) his thorough acquaintance with, and warm feeling towards, the people, in both senses of that word—the lower classes, and the nation at large; and (3) his mastery of HISTORICAL METHOD. He has not put forward any *system* of political economy, but his very numerous writings abound in original economic ideas, scattered through them, as Goethe says, like gold nuggets and gold grains. He shows himself to us as a sound-hearted, healthy-minded man, somewhat wayward and paradoxical in his mental habits, and "old world" in his views. He is opposed to the "liberal-rationalistic" school of Adam SMITH, dislikes the highly developed division of labour, objects to generalising and centralising tendencies, and looks with admiration and affection on many institutions of the feudal period. It was well that justice should be done to the merits of that age, but, in showing that the principles and practice of the past suited the contemporary social environment, he is sometimes led, like most lovers of antiquity, to represent them as adapted to the present, when they are really and necessarily obsolete and incapable of revival.

How strongly Möser impressed Goethe, and what an influence he had upon his youth, may be seen in bk. xiii. of the *Wahrheit und Dichtung*. His principal work, which takes rank as a German classic, is his *Patriotische Fantasieen*, 3 pts., 1774-1778, a series of short essays, which in many respects remind the reader of Franklin.

[Wegele in *Allg. Deutsche Biogr.*—Schmidt in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 500.—Cohn, *Hist. of Pol. Econ.* (see arts. on CAMERALISTIC SCIENCE; GERMAN SCHOOL).] J. K. I.

MOSER, FRIEDRICH KARL VON (1723-1798), after having studied law at Jena, and been some time engaged in tuition, successively entered into the civil service of several German princes, but roused a vindictive animosity against himself by his bold denunciations of the official exactions committed in the small German states. His outspokenness led to his being sentenced in 1780, by the faculty of law in Frankfurt-on-the-Oder, to six years' imprisonment in a fortress, and a fine of 20,000 florins. He however, succeeded in evading actual imprisonment.

He was a frequent and fragmentary writer on diplomacy and public law, but is best known by his book *Der Herr und der Diener, geschildert mit patriotischer Freiheit* (The Master and the Servant depicted with patriotic Freedom), 1759, in which he declares that "times are near when the choice will not be between good and bad, but between bad and worse," and professes to be ashamed to be a German, when he thinks "what kind of men most of the heirs presumptive will be."

[1] Morton's connection with this dilemma has been controverted. Bacon, *History of King Henry VII.*, speaks of it as "a tradition."

Although he manfully struggles against the narrow and selfish *Particularismus* of the German princes, he is not a follower of the French philosophers, but finds in St. Paul's remarks in the *Epistle to the Romans* on the powers that be, a right exposition of the duties of the subject; he praises Mirabeau the elder, but denies that there only exists one model of a good government. His own leanings are in favour of the state of things anterior to the Thirty Years' War.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 529-532.—Bluntschli, *Gesch. des allg. Staatsrechts*, pp. 404-413.] E. Ca.

MOSER, Johann Jacob (1701-1785), had as chequered an existence as his son Friedrich von Moser (*q.v.*). A man of great classical attainments, he was successively a lawyer, a university professor at Tubingen and Frankfurt-on-the-Oder, a member of the government of Wurtemberg and other German states, and founded an academy for political science in Hanau. His unguarded language in defence of the rights of the *Landstände* of Wurtemberg against their domineering duke got him into trouble, and he was imprisoned for six years (1758-1764).

He wrote about 400 volumes and pamphlets, and is considered as the founder of the science of German public law. He published a *Bibliothek von oekonomischen und Cameral Polizei-schriften* (Ulm, 1758), and some dissertations on economic questions; in his autobiography, he states that for a long time, cameralistics and the science of interior state policy had been his favourite studies. Roscher expressly mentions his *Grundsätze einer vernünftigen Regierungskunst nach der jetzigen Denkungsart . . . verständiger Regenten* (Principles of a rational art of Government according to the opinions and practice of intelligent Rulers), 1753, in which Moser designs to demonstrate that trade, the interior state policy, etc., form "a connected and systematic whole." As announced by its title, this book is an exposition of what was done in well ruled states of these times (England and France being often put up as examples), but abstains from doctrinal investigations of what ought to be. Although Moser had some quarrels with Friedrich Wilhelm I. of Prussia, he derives a good number of the "principles" he recommends from this king's policy.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 441-443.—R. von Mohl, *Literatur der Staatswissenschaften*, ii. pp. 401-412.—Bluntschli, *Allgem. Staatsrecht*, 2nd ed. p. 402.] E. Ca.

MOSSE or MOSES, Miles (fl. 1580-1614), divine, was the author of *The Arraignment and Conviction of Usury*, London, 1595, which may be taken as a representative statement of the more liberal church view of usury (see Interest and Usury) at the close of the 16th century. Mosse distinguishes between the sin of usury and usury itself.

[Ashley's *Economic History*, vol. i. pt. 2, p. 469, London, 1893, 8vo.—*Dictionary of National Biography*, vol. xxxix. p. 184.] H. E. E.

MOST FAVOURED NATION CLAUSE. This is inserted in many commercial treaties. It binds each of the contracting powers to give to the other in certain matters the same treatment which it gives or may hereafter give to the nation which receives from it the most favourable terms in respect of those matters. The nature of such stipulations will be understood from the following example, taken from a convention on trade-marks concluded between Great Britain and the United States in 1878.—"The citizens of each of the contracting parties shall have, in the dominions and possessions of the other, the same rights as belong to native subjects or citizens, or as are now granted or may hereafter be granted to the subjects and citizens of the most favoured nation, in everything relating to trade-marks and trade-labels" The concession here is strictly limited as to its subject matter; but in many cases the most favoured nation clause is made general in its terms, and covers all matters of trade and navigation. When such large expressions are used it sometimes happens that a state finds itself called upon to grant to a distant or unfriendly power, or even to a keen commercial rival, privileges it has given for valuable consideration to a friend and neighbour. Nations who have adopted protectionist theories of international trade are likely to find themselves in this predicament more often than those who are content to let commerce take its course without attempting to control it in their own interests by constant higgling with other powers. The inconvenience of having to give to one set of foreigners concessions for which a valuable equivalent has been extorted from another set has been avoided by means of the doctrine that the most favoured nation clause applies only to concessions which are gratuitous, and does not entitle the party which claims under it to privileges which some other state has gained by giving corresponding privileges in return, unless the claimant also is content to offer a fair consideration for them. It can hardly be said that this is a rule of international law; but it has been adopted in such a large number of cases that a state which acts upon it cannot be accused of bad faith.

English commercial treaties containing a most favoured nation clause will be found in Hertslet's *Treaties*. The view of the meaning of the clause enunciated above is explained and defended in Wharton's *International Law Digest* (§ 134). T. J. L.

MOTIVES, Measurable. A term suggested by Professor Marshall as offering one way of marking off the sphere of economics from that of other social investigations. Motives are measurable so far as they can be relied on to produce constant effects which can be quantitatively estimated. Again measurable motives can be balanced one against another, as when we estimate the amount of sacrifice a person is willing to undergo in order to procure a given

utility. Here the sacrifice and utility have both to be expressed in objective form before they can be economically measured. This is possible only when objects of desire or aversion can be freely transferred by contract between individual and individual. It is because economics deals primarily with such objects that the science has assumed a greater precision and exactness than any other social science. This characteristic has made it possible to examine economic phenomena by abstract, deductive, and, even to some extent, mathematical methods. W. E. J.

MOVABLES. Things which from their nature are capable of being moved from one place to another. The classification of things into movables and immovables is the only classification that corresponds with an essential difference in the subject matter. A leading distinction between movable and immovable property is that as to the latter, according to English law, the rules of inheritance follow the *lex situs*, while as to the former they follow the *lex domicilii*. The *lex situs* decides whether an article is a movable or not.

[Sir Henry Maine in *Ancient Law*, London, 1880, traces the gradual development of the distinction in Roman law.] J. E. C. M.

MÜLLER, Adam Heinrich (1779-1829), was born at Berlin. In his nineteenth year he went to the university of Göttingen, where he at first occupied himself with theology, and then became a student of jurisprudence, in which he was a pupil of Hugo. He afterwards sought to complete his education by the private study of the natural sciences, which he had previously neglected. He early formed a close intimacy with Friedrich Gentz, his elder by fifteen years; and this connection exercised an important influence both on his material circumstances and his mental development in after life. The two men differed widely in character and in their fundamental principles, but agreed, at least in their later period, in their practical political aims, and the friendship between them was brought to an end only by Müller's death. The relations of the latter with the Junker party, and his co-operation with them in their opposition to Hardenberg's reforms, made any public employment in Prussia impossible for him. In 1805 he was in Vienna, where he became a convert to Roman Catholicism, and, through Gentz, was brought into relations with Metternich, to whom he was useful in the preparation of state papers. He spent the years 1806-1809 in Dresden, being occupied in the political education of Prince Bernhard of Saxe-Weimar. In 1813 he entered the Austrian service, and in 1815 accompanied the allies to Paris; he was ennobled by the emperor in 1820. In 1827 he settled a second time in Vienna, and was employed in the state chancellery. He was one of the principal literary instruments of the reaction, and took part, as Gentz's assistant, in framing the Carlsbad resolutions.

He was a man of remarkable powers and of great versatility, a born orator, and distinguished as a writer, not only on politics and economics, but on literature and æsthetics. As Gentz said of him: "He impresses us with a sense of his superiority even when we believe him to be on a wrong path." His principal work is his *Elemente der Staatskunst* (1809), which contains the substance of a course of lectures which he delivered at Dresden before a number of statesmen and diplomatists. He was, along with Gentz and Haller, a member of the school of politicians and economists in Germany, which has been called the romantic, as harmonising in spirit with the literary school of Tieck, Schlegel, and Novalis, and looking back with admiration and regret to the church and state of mediæval times. In political economy he represents a reaction against the doctrines of Adam Smith, whom, whilst he highly commends him in certain respects, he censures as presenting a one-sidedly material and individualistic conception of society, and as being too exclusively English in his views. Müller's leading idea is that of the organic unity and continuity of the state and of social institutions in general—a principle for which he may have been in part indebted to Burke, whose *Reflections* were translated by Gentz. The economy of a society, he holds, is something more than the sum of the private economies of its members; the individual must always be regarded in relation and subordination to the community. The capital of a country is not material only; its language and culture, its character and experience, its laws and constitution, are true portions of the national wealth. The state is not merely a mechanism for the maintenance of order and the administration of justice; it represents all the physical and spiritual possessions and requirements of the nation, and ought to bind together the whole inner and outer life of the people into a harmonious and energetic unity. Not merely should it study present production and immediate gain, but keep before it the increase of productive power and the development of civilisation in the future, and preserve for coming generations their entire inheritance, intellectual, moral, and economic. Müller considers Smith's theory of the division of labour defective in not sufficiently emphasising the dependence of such division on capital—on the labours and acquisitions of the past—and sets beside it, by way of correction and completion, a theory of the national combination of labour as no less important, though little more than indicated by Smith. The practical system of Smith might suit England sufficiently well, because the spiritual and material life of the people rested on a firm basis of traditional sentiments and old institutions reaching back to

the middle ages, which continued to keep alive national self-consciousness and knit together the several social classes in a healthy union. But the ends thus spontaneously attained must, in continental countries, be affected by governmental action steadily maintaining the national idea and systematically developing the productive powers and general energies of the nation. In the economic sphere, he defends a policy of restrictions on importation as one means towards this development.

Müller's strength lies in breadth and comprehensiveness; his defect in want of definiteness of conception and expression. Notwithstanding his eminent ability, he does not seem to have exercised much influence on the thought of his own time or of the succeeding period. His project of a Roman Catholic revival, and his retrograde attitude in politics, doubtless created a prejudice against his general philosophical views; but it ought always to be remembered that his doctrines, though favouring the reaction, were not dictated by self-interest; throughout his career he advocated principles essentially identical, and, in supporting Metternich's policy, he believed himself to be serving the highest interests of Germany and of Europe. Some of his higher tendencies, freed from much of their alloy, are reproduced in the writings of the historical school of German economists (comp. GERMAN SCHOOL).

Among the publications of Müller less important than the *Elemente der Staatskunst*, the following may be enumerated: *Die Theorie der Staatshaushaltung und ihre Fortschritte in Deutschland und England seit Adam Smith*, 1812.—*Versuch einer neuen Theorie des Geldes*, 1816.—*Vermischte Schriften über Staat Philosophie und Kunst*, (2 vols., 2nd ed., Vienna, 1817)—and *Von der Nothwendigkeit einer theologischen Grundlage der gesammten Staatswissenschaften und der Staatswirthschaft insbesondere*, 1819.

[Mischler in *Allg. Deutsche Biogr.*—Lippert in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N.O.*, p. 763.—Kautz, *Die Gesch. Entwickelung der Nat.-O.*, p. 659.—Cossa, *Introd. allo Studio dell' E.P.*, p. 320.—Cohn, *Nat. Oek.*, i. p. 12.]

J. K. I.

MULTIPLICATION OF SERVICES is a term employed by Jevons (*Scientific Primer*) to denote that one of the advantages attending *Division of Labour* which arises when "nearly the same time and labour are required to perform the same operation on a larger or on a smaller scale"—in the words of WHATELY, who seems first to have pointed out this advantage (*Lectures on Political Economy*, vi.). Thus, "if a messenger is going to carry a letter to the post-office, he can as readily carry a score" (Jevons, *loc. cit.*). This advantage is connected with production on a large scale, under which head it is treated by Mill (*Pol. Econ.*, bk. i. ch. 9).

"Multiplication of copies" (Jevons, *loc. cit.*) is a particular but important case. When once type has been set up, additional copies can be printed without much additional expense. A similar advantage is afforded by the use of "interchangeable parts" (Marshall) in machinery.

F. Y. E.

MUN, THOMAS (1571-1641), the best-known writer on the mercantile system, was son of John Mun, mercer, of London. As a member of the committee of the East India Company, and of the standing commission on trade (appointed in 1622, reappointed in 1625) "he was in his time famous amongst merchants and well known to most men of business, for his general experience in affairs, and notable insight into trade" (*England's Treasure by Foreign Trade*, John Mun's epistle dedicatory to Thomas, Earl of Southampton). In 1621 he published, in defence of the East India Company, *A Discourse of Trade from England into the East Indies*, reprinted in the same year, in Purchas's *Pilgrims* (1625), and in *Early English Tracts on Commerce*, London, 8vo, 1856. He is, however, best known by his posthumous work, *England's Treasure by Foreign Trade, or The Balance of our Foreign Trade is the Rule of our Treasure*, London, 8vo, 1664, republished in 1669, 1698, 1700 (in Lewis Roberts' *Mappe of Commerce*), 1713, 1755, 1856 (*Early Tracts on Commerce*), and 1895 (*Economic Classics*, edited by W. J. Ashley). There are two well-known allusions to this work in Adam Smith's *Wealth of Nations*, bk. iv. ch. i., in the first of which Smith quotes the concluding paragraph of the fourth chapter: "If we only behold the actions of the husbandman in the seed-time," etc.; and in the second, states that "the title of Mun's book . . . became a fundamental maxim in the political economy, not of England only, but of all other commercial countries."

The importance of Mun's work in the development of economic theory in England has been pointed out (ENGLISH EARLY ECON. HIST., vol. i. pp. 722 *seq.*, 730). The date of its composition and its publication are of considerable interest. It was published twenty-three years after Mun's death, by his son John, who states in the epistle dedicatory that it was left to him "in the nature of a legacy" by his father. But it appears to consist of several short papers, some of which were written about 1622, and all before 1628. Whether the final form and arrangement of the treatise is due to Mun himself or his son John, there is nothing to show. Ch. i., on "the qualities which are required in a perfect merchant of foreign trade," probably formed part of the "former discourse," to which he alludes in his address to his son, in which he proposed to teach him "how to love and serve his country, by instructing him in the duties and proceedings of sundry vocations." The opening sentence, the

marked difference of style between this chapter and the rest of the treatise, and other circumstances, point to this conclusion. In ch. ii., on "the means to enrich the kingdom," etc., and ch. iii. on "the particular ways and means to increase the exportation of our commodities," etc., he follows the order indicated in the address to his son. The following chapters are taken up with (1) the discussion of the advantages of the exportation of bullion; (2) replies to various arguments employed by MALYNES and MISSELDEN, in their controversy of 1622-23, and to the advocates of the debasement of the currency; (3) the fuller discussion of points briefly touched upon in ch. iii.; and (4) the method of calculating the balance of trade. Chs. iv. to vii. correspond almost verbatim to the *Petition and Remonstrance of the Governor and Company of Merchants of London trading to the East Indies*, which was drafted by Mun, and presented to the House of Commons in October 1628. This portion of *England's Treasure* may have been the rough draft of the *petition*. The differences between the two at any rate point to the fact that the latter was based upon the former. Chs. viii. to xv. are entirely taken up with the discussion of various arguments urged by Misselden and Malynes, and the advocates of the debasement of the currency. He objects to Misselden's contention that the want of money was due to the undervaluation of silver (*Free Trade, or The Means to make Trade flourish*, 1622), no less than Malynes's theory of the foreign exchanges (*The Maintenance of Free Trade*, 1622; *Lex Mercatoria*, 1622, etc.). He devotes the whole of ch. xiv. to a discussion of the "admirable facts" attributed to the bankers by Malynes, whom he accuses of "disguising his own knowledge with sophistry to further some private ends by hurting the public good," *i.e.* by re-establishing the office of royal exchanger. In his first pamphlet, Misselden had been anything but friendly to Mun's views on the East India Company; but his second pamphlet, *The Circle of Commerce*, etc., 1623, gives unmistakable evidence of Mun's influence. Ch. xv. of *England's Treasure* appears to be mainly a reply to Malynes's *Canker of England's Commonwealth*. Chs. xvi.-xviii., "on Revenue, etc.," must have been written not later than the early years of the reign of Charles I.; while ch. xix., in which Mun discusses the fishing trade, and quotes from the Dutch proclamation of 19th July 1624, was put into shape not very long subsequent to that date. The last two chapters deal with "the order and means whereby we may draw up the balance of our foreign trade," and "the conclusion upon all that hath been said concerning the exportation or importation of treasure." There appears to be no allusion throughout the treatise to any event later than 1624. No part of the work can have been written later than 1628, when the Petition and Remonstrance was presented to parliament, and most of it belongs probably to the years 1622-1625. The inquiry after the restoration into the desirability of legalising the exportation of bullion, followed by the act of 1663 (15 Car. II. c. 7), probably suggested the publication of Mun's work.

[A full account of Mun's life is given in the *Dictionary of National Biography*. For other points in his work see ENGLISH EARLY ECONOMIC HISTORY and ENGLISH SCHOOL OF POLITICAL ECONOMY, vol. i. pp. 719-737 (EXCHANGER ROYAL), and the authorities quoted there. See MERCANTILE SYSTEM.] W. A. S. H.

MUNICIPALITY.

Roman, p. 829; Mediæval, p. 830; Modern, p. 831; Municipal Government in Belgium, p. 831; in France, p. 832; in Italy, p. 834; in Prussia, p. 834; in United States of America, p. 837.

THE term municipality is ambiguous. Sometimes it signifies a town which is treated as a distinct unit for purposes of administration and sometimes the administrative authority in such a town. In another article (see ADMINISTRATION), it has been shown that in a large community it is impossible to concentrate the whole business of executive government at one spot, and that the centres of administration must be multiplied. It has also been shown that most governments have not merely spread their official administrators over the whole territory, but have enlisted private citizens in such portions of administrative work as immediately affect a particular neighbourhood. A certain degree of decentralisation and of local self-government is necessary to the proper administration of a great civilised state. Towns and cities have naturally obtained the largest share of these privileges, and for a long time throughout the greater part of Europe local self-government meant municipal self-government.

Roman Municipalities.—The earliest available instance of municipal self-government on a grand scale is afforded by the Roman power. Whilst the Romans established a universal empire, they never quite abandoned the antique idea that the city is the normal political community. Under the Roman emperors the Mediterranean world was divided into thousands of urban communities. Each city possessed a more or less extensive territory, and within this territory certain powers of self-government were exercised by those who possessed the franchise of that city. As the whole empire, or at least all its civilised portions, were thus divided into urban districts, no antithesis arose between urban and rural authorities. It was as though every English county were administered by those who possessed burgess rights in the county town, but it must

be added that residence was not in antiquity a necessary condition of obtaining such rights. The Roman municipal system was unquestionably a boon to the countries in which it was established; it served to keep alive the local patriotism, the interest in public business, and the spirit of public munificence so apt to dwindle among the subjects of a despotic monarchy. Magnificent remains scattered over most of the countries of the Mediterranean still show how nobly the municipal authorities of the Roman towns provided for the health, the convenience, the education, and the amusement of the burgesses. It is true that municipal extravagance and mismanagement were also common. Those defects afforded an excuse for the interference of the central government, and by degrees the Roman municipalities became practically powerless. Finally the barbarian conquests wrought such havoc in the Roman municipal system that it is doubtful how far any connection can be traced between it and the municipal system of the middle ages which next claims attention.

Mediæval Municipalities.—When the era of barbarian inroads finally closed in the tenth century, and the revival of civilisation brought prosperity again to towns, a new period of municipal development began. In this period municipal life is strongly contrasted with rural life. Feudalism laid its closest grasp on the rural districts, where a hierarchy of petty princes reigned one above another, and the lowest class of the population were in an almost servile condition. Important towns generally succeeded in placing themselves under the immediate protection of the sovereign or of a feudal magnate of the highest class, and all the inhabitants of such towns were personally free. Thus in the towns there was a scope for ambition and a security for hoarded wealth unknown in the country districts. In this period also municipal self-government frequently grew into something like political independence. None of the municipal towns of the Roman empire could have hoped to resist the will of the Roman emperor. But the municipalities of the middle ages had only to deal with feudal monarchs, whose real power was often as little as their titles were pompous. In the mediæval system of warfare, the means of attack were so much inferior to the means of defence that it was extremely difficult to reduce a large walled city, defended by a numerous and enthusiastic people. The burgess militia, however inferior to regular troops, were often more than a match for the arrogant and undisciplined knighthood. The most superficial readers of mediæval history know how the burghers of Milan stood a siege by the Emperor Frederick Barbarossa, and how the burghers of Ghent more than once faced the chivalry of France in the open field. Thus the great municipal towns of Italy became practically sovereign states, and the great municipal towns of Germany and Flanders became hardly less than sovereign. Lastly, the municipal organisation of mediæval towns was to a large extent industrial. There is no room here to discuss the history of the merchant and craft gilds or their relation to the government of the towns in which they arose. Nor is it safe to lay down any general law of development with reference to the constitutions of mediæval municipalities. In a majority of cases, perhaps, the result was the absorption of power by an urban aristocracy of commerce and industry, as opposed to the feudal aristocracy of land-owners in the country districts. Under these circumstances it was natural that mediæval burghers should be prone to fierce internal dissensions, and to an exclusive local patriotism, not merely hating the feudal lords and contemning the peasantry, but intensely jealous of the power and prosperity of any town but their own, a fatal weakness which was fully exemplified in the history of Flanders, and of Italy. At the same time the services rendered to civilisation by the mediæval municipalities were incalculable. At a time when the bulk of the country population in central and western Europe were little better than beasts of burthen, the municipal towns were sanctuaries of industry, art, and learning. Their wealth was such as under the conditions of the time might seem incredible, were it not yet attested by the splendour of their churches, of their municipal buildings, and even of their private mansions. But the condition of their freedom and power was the continuance of semi-barbarism without the walls. When feudal anarchy had been suppressed in the country districts, monarchs no longer needed the support of privileged towns. When the invention of gunpowder had transformed the art of war, town walls were no longer impregnable, and the burgher militia became useless against professional soldiers. The exclusive jealous spirit which set town against town, and class against class, made impossible all resistance to a centralised despotism. From the close of the 15th century onwards, the central government everywhere gained rapidly upon municipal independence.

In England the history of municipal development was somewhat different. Self-government by the free inhabitants prevailed there in rural as well as in urban neighbourhoods, and the representatives of the towns took part in the county courts. Again the towns were relatively far less important in England than in Italy, Germany, or even France, for mediæval England was an agricultural and pastoral, rather than an industrial or commercial country. Thirdly England attained national unity and a powerful government at a comparatively early time. Lastly, the old free institutions were never overthrown

in England as elsewhere. Owing to all these causes municipal towns in England never occupied so distinct or so conspicuous a place, whilst they escaped such a complete enslavement as befell municipal towns on the continent of Europe.

Modern Municipalities.—The third period of municipal development, which may be termed the modern period, may be dated from the French revolution. That revolution, and the revolutions which followed it, have converted the despotic monarchies of central and western Europe into governments more or less popular. The same desire for self-government which prompted this change led to a demand for reformed municipal constitutions. In England reform came more naturally as the feeling of local independence and the interest in local affairs had never quite died out. In the United States vigorous municipal institutions existed even prior to the separation from the mother country. This new municipal life differs from the municipal life of the middle ages in several weighty respects. The long-continued pressure of the central government, and the changes wrought by modern civilisation, have lessened the contrast between town and country. Municipal self-government has been very generally extended with some modifications to the rural districts of this and of other countries. Again, the modern municipal town cannot aspire to political independence. Military power is now centred in the hands of the national government to an extent never paralleled save under the Roman emperors. Lastly, the exclusive spirit which formerly parted town from town, and the ruling class of each town from the rest of the citizens, has practically disappeared. Modern municipal self-government is democratic, and the only dangers which threaten its future are those incidental to democracy, such as the withdrawal of sensitive and high-minded men from public life, the too ready reception accorded to demagogues, and the popular fallacy that too much money cannot be raised in rates or spent in wages. Several cities of the United States have afforded the most alarming examples of robbery and corruption. It is not reassuring to learn that a common remedy for these evils is to appoint some eminent citizen as a dictator, for this is an acknowledgment that municipal institutions have no power of self-purification. In Germany it is a not infrequent practice for the municipality to entrust the administration to a professional expert. In France, and especially in Paris, municipal profusion is conspicuous. Similar tendencies have developed in England. What functions should be entrusted to a municipal body is a large and complex question which cannot be solved without wide experience. Watching, lighting, sanitary control, and the execution of public improvements, are clearly within its province. Much may be said in favour of entrusting to it the provision of such articles of general use and necessity as are already subjects of a virtual monopoly, *e.g.* the supply of gas and water. But there is nothing to justify the belief that the municipality should be sole landlord or sole capitalist in the town. There is no reason to suppose that a town council is fit to manufacture cotton goods or ship plates. The supply of men fit for municipal office is small; the time which they can give to public affairs is limited; and under the conditions of modern life much alteration in either respect is not likely to be made. The tendency to ask of municipal bodies more than they can possibly perform is the most serious danger which threatens municipal self-government in modern Europe.

F. C. M.

MUNICIPAL GOVERNMENT IN ENGLAND. See CORPORATION, MUNICIPAL, METROPOLIS; MUNICIPALITY.

MUNICIPAL GOVERNMENT IN BELGIUM. The words *municipalité, municipal* are not used by the Belgian constitution or laws on the subject; the words *commune, communal* have alone a legal standing.

Under the Dutch rule of the beginning of this century, a distinction was maintained between the administration of the towns and what was called the "flat country" (*le plat pays*); the communal law of the 30th March 1836 submitted the whole of the territory to a uniform communal legislation.

According to the constitution, the communal councils must be directly elected by the electoral body; their power extends over all subjects of communal interests, the central government having only the right to declare void any resolution in contradiction with the general interest, and their sessions and accounts must be kept open to publicity. These general principles laid down in the constitution of 1831, have been further developed by the already-mentioned law of 1836 which is still in force, except, as we shall presently see, for the mode of election of the councillors.

The number of councillors varies from seven to thirty-one according to the figure of the population; no restriction is laid on their meetings; they meet whenever it is expedient for the transaction of communal business, the *bourgmestre* (mayor) occupying by right the

chair. Their right to impose local taxes to supply the financial wants of the *commune* is far more extended than in France and in Italy, and in fact, almost unlimited.

The *bourgmestre*, who is at once the agent of the king and the head of the *commune*, is nominated by the king, who possesses the right of selecting him even outside the communal council, a royal prerogative which remains practically dormant. With the *échevins* (aldermen, from the Flemish *schepen*, in mediæval Latin *scabini*) formerly nominated by the king, now elected by the council, the *bourgmestre* forms the *collège échevinal*, or executive committee entrusted with the daily local administration, but in matters of *état civil* (public registration of births, marriages, and deaths) and of police, the *bourgmestre* has a distinct and individual authority of his own and is personally responsible for public order.

The king cannot dissolve a communal council, though he may cancel any resolution, illegal or opposed to the general good. The *députation permanente* of the provincial council is also entrusted with some powers of control on certain specified subjects, but, on the whole, Belgium is one of the countries on the continent where local autonomy and independence is most extended, and most solidly founded on an almost uninterrupted transmission of traditions and customs tracing their origin to the flourishing period of Ghent, Bruges, Ypres, etc., during the last centuries of the middle ages.

A quite recent law (May 1895) has considerably enlarged the communal electoral body. Every Belgian citizen aged thirty and having three years' residence is now entitled to one vote. He may acquire from one to three extra votes, if he is married, in possession of certain degrees or diplomas, directly taxed for a certain *minimum* amount, or in receipt of a certain income.

[For the middle ages see Professor Van der Kindere, *Le Siècle des Artevelde*, Brussels, 1879, Alphonse Wauters, *Les Libertés Communales, Essai sur leur Origine et leurs premiers développements*, Brussels, 1878, and Pirenne, *Histoire de la Constitution de Dinant* and *Histoire de Belgique*, 2 vols. (published 1900 and 1903). Several collections (*Recueils des Ordonnances, des anciennes coutumes de la Belgique, coutumes de Flandre, du Brabant*, etc.) have since 1850 been published by official authority.

For the more purely legal aspect see Charles Faider, *Études sur les Constitutions Nationales* (1842), and *Coup d'Œil historique sur les institutions provinciales et communales en Belgique* (1834). —For present times De Brouckère et Tielemans, *Répertoire du Droit Administratif de Belgique* (8 vols., 1834-56 unfinished).—De Fooz, *Le Droit Administratif Belge* (1866).—Leemans, *Des Impositions Communales en Belgique* (1866).—Giron, *Essai sur le Droit Communal en Belgique* (1862). —Bivort, *Commentaires sur la Loi Communale de Belgique*, 9th ed. (1882); and Giron, *Le Droit Administratif de la Belgique*, 3rd ed. (1885).]

E. Ca.

MUNICIPAL GOVERNMENT IN FRANCE. The *commune* is the ultimate territorial and administrative unit of France; this name is now equally applied to the towns and the rural parishes (*paroisses*) which used to be kept distinct before the French Revolution. At the time of the latter, the *Assemblée Constituante* recognised the legal existence of about 44,000 *communes* for continental France; the present number slightly exceeds 36,000, about one-half of which have a population inferior to 500 inhabitants. It is generally considered that a further reduction of this number by means of the consolidation of neighbouring diminutive rural *communes* would be desirable.

Excepting Paris and, to some extent, Lyons, all French *communes* are regulated by the law of the 5th of April 1884 on municipal organisation, which has repealed or modified the former legislation of 1837 and 1855; according to the preliminary report presented to the chamber of deputies, it was intended to be "a reform most favourable to the extension of communal freedom." The following summary will show that space still remains for further extension, and that, with the exception of their everyday business, French municipal authorities are only allowed to move under the *tutela* of the central government and its official delegates, the *préfet* and the *sous-préfet*.

"The municipal body of each *commune* is composed of the municipal council, the *maire* and one or several *adjoints* (or deputies of the *maire*)." Such is the text of article 1 of the law. The minimum number of municipal councillors is 10 for *communes* under 500 inhabitants, and progressively rises with the population to a maximum of 54. The *maire* and *adjoints* are elected from their own body by the municipal councillors, themselves directly elected by all male inhabitants above twenty-one, settled in the *commune* or resident there six months and not in actual receipt of relief from the *Bureau de Bienfaisance*. Non-resident voters are admitted on their demand, if their names are on the list of taxpayers, but nobody is allowed to vote in more than one *commune*. All male inhabitants, paupers of course excluded, or taxpayers above twenty-five years of age are qualified to be elected, but the number of non-resident councillors must not exceed one-fourth of the total number of councillors. Several classes of state or municipal officials, such as the public schoolmaster and priests, cannot be elected.

Municipal councils are elected for four years; they may, in case of urgency, be suspended for one month by the *préfet* of the department, but the President of the Republic is alone empowered to dissolve them and his decree must

state the motives of the dissolution. He then appoints a provisional delegation of 3 to 7 members entrusted with the management of urgent affairs; a new election must take place within two months.

The *maire* and municipal councillors can draw no salary, but the reimbursement of actual expenses is permissive, and the *maires* of large towns sometimes are awarded what are called *frais de représentation*—expenses for receptions and entertainments, etc.

Municipal councils have four annual ordinary sessions, three of a fortnight and one for the debates on the budget which may last six weeks. The *préfet* and *sous-préfet* may summon them for an extraordinary convocation, so also may the *maire* who is further obliged to summon the council whenever required to do so by a majority, specifying the object of its request. In this case he must inform the *préfet*, and only the specified questions can be discussed.

The *maire* is legally the chairman, except when his own administrative accounts are examined. As a rule, the meetings of the council are open to the public, and an extract from the journals must be stuck up at the door of the town hall within the week. Every inhabitant or taxpayer is entitled to claim the perusal of the journals, municipal budget, and accounts, etc.

The specific functions of the council as enumerated by article 61 of the law are—

(*a*) to regulate by its resolutions the business of the *commune*.

(*b*) to give its advice when required by law or by the superior authorities.

(*c*) to protest if necessary against the *quota* of apportioned taxes assessed on the *commune*.

(*d*) to express wishes (*vœux*) on all subjects of local interest.

(*e*) to draw up the list from which the prefectoral authority nominates the assessors for the apportionment of certain taxes. An extract of all resolutions is to be sent within a week to the *sous-préfet* by the *maire;* if these exceed the range of the legal attributions of the council they are legally void and are declared so by the *préfet*. Political wishes fall under this description; still the delegates of all the municipal councils make up the bulk of the electoral body for the French Senate. Every taxpayer and any person having an interest at stake, is also entitled to sue for a declaration of nullity of a resolution within a fortnight. The council of state is the supreme jurisdiction for all suits of this kind.

French *communes* are legally capable to own property, both movable and real, constituting either their public domains, *e.g.* schools, hospitals, streets, libraries, churchyards, etc. or their private domains, *e.g.* houses, arable land, fields, woods, consolidated state funds. Houses and land may be sold, rented, and farmed, but the terms of these transactions must be approved by the superior authorities, even for leases, when they exceed eighteen years. The same approval is necessary for all resolutions on rights of commons, on acceptance of legacies and donations, if hampered with charges or conditions, or giving rise to opposition from the family of the testator or donor; for the communal budget, the vote of supplementary supplies; the raising of extraordinary taxes or contracting of loans, if their principal exceeds a certain proportion. The foundation or suppression of fairs must also be sanctioned by the *préfet*. Even resolutions, which do not require his sanction, only become executory one month after they have been notified to him.

The council is not allowed to publish proclamations or to enter into correspondence with other municipal councils, unless in a few specified cases and always under the prefectoral supervision. No *commune* can appear in court without being authorised by the *préfecture*.

The budget of each *commune* is proposed by the *maire*, voted by the municipal council, and sanctioned by the *préfet*; whenever the communal income exceeds 3,000,000 of francs (£120,000), the final approbation of the President of the Republic is requisite. Certain items of expenditure are compulsory; let us mention as such the registration of births, marriages, and deaths; the repairs of communal buildings and public churches—for the latter in case of insufficiency of the means at the disposal of the *conseil de fabrique* (vestry)—the communal share in the expenses concerning public instruction; the keeping in order of cemeteries and communal roads; the salaries of specified communal functionaries, etc. The *commune* must also provide for the expenses of its police, notwithstanding the fact that in towns of more than 40,000 inhabitants, the personal regulation of the force belongs to the President of the Republic. Thus, although the *maire* is nominally the head of the municipal police, his immediate subordinates, the *commissaires* of police, are in fact the agents of the prefectoral administration. It must not be forgotten that the *maire* himself is at the same time the elected representative of the *commune* and the local agent of the central government; until the end of the second empire, he was appointed by government, which has kept the right to dismiss him.

In one respect the communal councils are subject to the permanent control of local taxpayers. Article 123 of the law empowers any one of these to initiate at his own risk, and with the agreement of the *conseil de préfecture*, "the lawsuits which he considers to belong to the *commune*, and which the council having been invited to discuss has refused or neglected to prosecute." The resulting judicial decision binds the *commune*.

From this slight sketch it will appear that,

compared with other countries, the French municipal authorities are confined within rather narrow official trammels. French political parties clamour for decentralisation only as long as they remain in opposition.

[See *les Controverses sur la Décentralisation administrative* in the *Revue Politique et Parlementaire* (April and May 1895), by Léon Aucoc, the highest authority on the subject.

French urban municipalities and *communes* have a double origin; in southern France they were generally survivals or revivals of Roman Municipia; in the north they arose during the 12th century from the revolts of the *bourgeoisie* against their feudal lords. For this movement see Augustin Thierry, *Lettres sur l'Histoire de France* and *Essai sur la Formation et les Progrès du Tiers État.*—Luchaire, *Les Communes française à l'Epoque des Capétiens directs* (1890).—Guizot, *Cours de l'Histoire de la Civilisation en France*, and numerous monographs such as Flammermont, *Les Institutions Municipales de Senlis* (1881).—Prou, *Coutumes de Lorris aux XII^e et XIII^e Siècles* (1884).—Giry, *Établissements de Rouen* (1883).—Bonvalot, *Le Tiers État d'après la Charte de Beaumont* (1884), etc. The French kings favoured the *communes* in their struggles against their *Seigneurs* (see Giry, *Documents pour les relations de la Royauté avec les Villes au XII^e et au XIII^e Siècles*, 1885). Two centuries later the towns had to submit to the royal power. For the period extending hence to modern times, see de la Poix de Fréminville, *Traité Général du Gouvernement des communautés des villes, bourgs, villages et paroisses* (1760).—Boileau, *Recueil de Règlements concernant la Municipalité* (1785).—Raynouard, *Histoire du Droit Municipal en France* (1829), and Béchard, *Histoire du Droit Municipal au Moyen Age et dans les Temps Modernes* (1875).

For the present times, see Pascaud, *De l'Organisation Municipale et Communale en Europe, aux États Unis et en France* (1877).—H. de Ferron, *Institutions municipales et provinciales comparées* (1884), and the great work (in 8 vols.) of A. Batbie, *Traité théorique et pratique du Droit Public et Administratif* (1885).—Yves Guyot, "Municipality of Paris," *Contemporary Review*, 1883.]

E. Ca.

MUNICIPAL GOVERNMENT IN ITALY. The law of the 20th March 1865 is still in all essential points the great charter of Italian municipal organisation. On four of these points it is modelled on the Belgian legislation: thus the *sindaco* (or mayor) is nominated by the king who can also remove him; the qualification of a voter is based on the annual payment of one or another direct tax with a *minimum* varying from 5 to 25 lire (say 4s. to £1) according to the population; moreover, owners of university degrees, civil and military officials, professors, bearers of an Italian order, etc. are electors by right, and unlettered citizens cannot vote; in financial matters and questions of communal property, the control over the resolutions of the communal council rather belongs to the *deputazione provinciale* (permanent delegation of the provincial council) than to the prefect; and, fourthly, the *giunta municipale* comprising the *sindaco* and from two to ten *assessori*—the latter elected by the members of the *consiglio comunale* among their own members—have corporate existence recognised by law, like the Belgian *collège échevinal.* In other points the example of France was followed. Thus communal councils have two ordinary annual sittings, not exceeding thirty days each, unless a prolongation be granted by the provincial deputation; for extraordinary sessions they must be summoned by the prefect, acting either *ex officio*, or on the petition of the *giunta*, or of one-third of the councillors, and in these extraordinary sessions resolutions can only be taken on questions specified beforehand. In the interval between the sittings, the *giunta* represents the communal council, to which it is accountable. In all deliberations concerning the budget, the prefect has always the right to be heard. He, as well as the communal councils themselves, may appeal to the king against any decision taken by the provincial deputation in its controlling capacity.

[Several papers on Italian Municipal Administration have appeared in the *Bulletin de la Société de Législation Comparée*, 1877, pp. 97-126; 1881, pp. 266-307 and 325-344; 1882, pp. 413-430.]

E. Ca.

MUNICIPAL GOVERNMENT IN PRUSSIA. The year 1808 marks the beginning of a new era in the history of the Prussian administrative system, and especially in the form of municipal government. The social and political condition of the country immediately after the Thirty Years' War demanded radical changes, if it was to maintain its individuality amongst the civilised nations. The cities, after having attained, during the second half of the middle ages, a large measure of local independence and general prosperity, gradually lapsed into a condition of state tutelage. The 17th and 18th centuries found them stripped of every vestige of municipal authority and self-government. They had become *close corporations*, whose officials were appointed through, and dependent upon, state patronage. The complete disruption of the country through the crushing defeats inflicted by Napoleon in 1806 and 1807 made this organic weakness so apparent to the leading statesmen of the time that positive steps towards reform were immediately taken. The group of laws known as the *Stein-Hardenbergsche Gesetzgebung* forms the first and most important chapter in the series of administrative reforms of which the legislation of 1872 and 1876 marks the closing step.

To Stein is due the Municipal Corporations Act of November 19th, 1808, which is still the basis of municipal government in Prussia. In the acts of 1831, 1850, and 1853, which latter is at present in force, modifications in a con

servative spirit were introduced tending towards a somewhat stricter control of municipal action by the central government.[1]

The general characteristics of municipal government in Prussia find such distinct expression in the organisation of the administration of Berlin that the description of the latter gives an adequate idea of the general system.

The general city administration of Berlin is in the hands of an Executive Board or *Magistrat*; a Municipal Council; and a series of *Deputations* or committees, the nature of which we shall have occasion to examine.

The *Executive Board* (*Magistrat*).[2]—This board occupies a twofold position. It is entrusted with the execution of purely city affairs, and is also the representative of the state for the exercise of the more general or state functions. In the former of these capacities it is responsible to the municipal council, in the latter to the central government.[3] It is composed of a chief-mayor, vice-mayor, and thirty-two aldermen. Of these thirty-four offices, seventeen are professional in character, and therefore paid; the remaining seventeen unsalaried or honorary, to which every citizen is eligible. Acceptance of the unsalaried offices is obligatory. All members of the executive board are elected by the city council, the salaried members for a period of twelve, the unsalaried for six years. All are re-eligible, and the salaried offices are practically life positions.

The mayor is the presiding officer of this board, and has the legal right to veto its decisions.[4] Where the board and the mayor are in actual conflict the ultimate decision is placed in the hands of the supreme administrative court (*Oberverwaltungsgericht*). It is necessary to examine briefly the method of settling these disputes, as this illustrates one of the leading features of the Prussian administration. The question of the jurisdiction of the administrative courts and the semi-judicial bodies, which has acquired such importance since the reforms of 1872, 1876, and 1883, is exceedingly complicated. They are intended to settle such administrative disputes as may arise between the citizen and the public administration and between the various organs of the local or general administration. In cases where such differences have arisen between the executive board and the municipal council, the general rule is an appeal to the district committee[1] as administrative court of the first instance, and to the supreme administrative court for final decision. Berlin offers an exception to this general rule, for in cases of such differences the supreme administrative court acts as first and final resort.

The vice-mayor acts as substitute to the mayor in the details of his administrative duties. The remaining fifteen salaried members of the executive board are as follows:—two corporation counsel, two school councillors, two city architects, a city treasurer, and eight additional members. It is characteristic of the Prussian system that the incumbents for these salaried offices are chosen from all parts of the kingdom. The office of mayor in the larger towns is a purely professional one. Men who have gained a reputation as efficient administrators in the smaller cities are called to fill the important offices in more important centres. The choice of the city council for both salaried and non-salaried members of the executive board requires the approval of the provincial government. This apparently far-reaching restriction on local self-government is, as a general rule, a mere matter of form. It is to this executive board that the great bulk of the general city administration falls. In addition to its executive functions it may be regarded as constituting a part, at least, of the legislative branch of the city government, inasmuch as all decisions of the municipal council require the approval of the executive board. That this combination of executive and legislative powers makes the executive board by far the most important of the organs of the city administration is evident. In cases where the city council and the executive board come into conflict the supreme administrative court decides, upon the appeal of either body.

The detailed control and general administrative supervision of the various municipal departments is exercised by the committees, or *deputations* already mentioned. We have here one of the peculiar characteristics of the

[1] It is important to note that the Prussian system makes very clear distinction between urban and rural communities, and that the laws applying to each are entirely different. In this respect it differs entirely from the French system of local government, where no such distinction is made, the same form of local government applying there to both urban and rural communities.

[2] The salaries of the most important offices in the city government are as follows:

In the executive board the minimum compensation of paid members is 7000 marks. These salaries are increased from year to year in proportion to the term of service.

The highest salary of a regular member of the executive board is at present 11,600 marks.

The mayor receives 30,000 marks.

The vice-mayor 18,000 marks.

The salaries of chiefs of departments range from 3000 to 6000 marks. A few, such as the superintendent of the city insane asylum, receive as much as 9000 marks.

Members of the town council receive no compensation.

[3] It is to be noted that the government of Berlin is representative of the municipal system in the seven eastern provinces of Prussia. In the western provinces a system more closely resembling the system of the French *communes* is to be found.

[4] Very few instances of the exercise of the right have occurred, so that it is almost looked upon as non-existent. It has nevertheless given the mayor a very strong influence, moral if not legal, in determining the policy of the board.

[1] This committee is composed of the district president, two members appointed by the king, and four citizens elected by the provincial committee. Although Berlin has such a committee, it does not exercise the same extensive functions as in other parts of the kingdom; its constitution is also somewhat different.

Berlin administrative system. It is an attempt to bring about a personal union between the executive and legislative branches of the city government and the general body of citizens. These committees are made up of city councilmen and private citizens, elected by the city council, to whom the executive board adds a number of its members. One of the latter acts as presiding officer. The exact proportion of representation from the various bodies is determined by municipal ordinance. There are at present the following *deputations*:—on taxation and military affairs, poor-law administration, streets and public buildings, street cleaning, schools, city property, parks, pensions, fuel, stationery, public health, statistics, street lighting, water-works, savings-banks, gymnastics, and industrial schools. The heads of the various municipal departments are, for the most part, experts entrusted with the executive policy of their particular department, and are responsible to these deputations for their financial and administrative methods.

The Municipal Council.—The leading feature of the Prussian Municipal Corporations Act is the absence of any minute and detailed grant of power, either to the city as a whole or to the municipal council in particular. On the one hand, its competency is limited by the general sphere of municipal action, and, on the other by the powers expressly and exclusively vested in the executive board. Not only is it charged—in connection, as a rule, with the executive board—with the financial and general administrative legislation, but it also exercises a strong control over the purely executive acts of the city administration. This is done through a series of standing committees entrusted with the examination of the accounts, contracts, and other acts of the various departments. It is, however, important to note that the executive branch is not compelled to carry out the will of the city council, unless this meets with its approval. In order that this conflict may be avoided as far as possible, the executive board has the right, and, upon the demand of the city council, may be required, to send representatives to the meetings of the council. The city council is elected by the tax-payers through what is known as the *three-class* system, adopted in 1849 for state elections, and soon after incorporated in the Municipal Corporations Act. The tax-payers are, for purposes of electing members of the municipal council, grouped into three classes, according to the amount of direct taxes paid by each. The first class comprises those among the most heavily-taxed inhabitants whose total contribution is one-third of the aggregate. They elect one-third of the city councillors. The next group, paying an equal amount, *i.e.* another third of the total sum, elect the same number. The remaining qualified voters elect the final third of the total number of city councillors. It is evident that, according to this system, the wealth of the community really determines the character of the municipal council. Thus in 1887, with 3849 voters of the first class, 17,730 of the second, and 192,274 of the third, a comparatively small percentage of the population of Berlin exercised the controlling voice in the election of its council.

To the general rule of local self-government in the various municipal departments, there is one important exception, which is, however, not peculiar to Berlin, but characteristic of all the large Prussian cities. In all the smaller communities, the mayor is entrusted with the police administration. In cities the population of which exceeds 10,000, the minister of the interior has the power to place an official appointed by and responsible to him at the head of the police service. He is known as the president of police (*polizei-präsident*). He has charge of the department of public safety in the narrower sense of the term. The other branches of the police service, *i.e.* such as are not immediately concerned with the preservation of peace and order, like the health, trade, and building police, remain a part of the city administration proper.

The cost of the police service is paid out of the state treasury, but the city is required to contribute 2½ marks per capita of population. This represents hardly one-third the entire cost.[1]

To sum up the general characteristics of the Prussian system, we find in the first place a strong tendency towards decentralisation, in order directly to interest a large body of citizens in the work of public administration. In the various deputations, poor-law commissioners, ward provosts, and the like, nearly 10,000 of Berlin's citizens are devoting some of their best energies to the city's welfare.

The city council, while possessing important legislative functions, exercises an important control over the acts of the executive board. The position of the latter both as executive branch of the city government and upper chamber of the legislative branch, gives it the preponderating influence in determining the general policy of the city administration. The unique position occupied by the *deputations* is another of the distinguishing features of the Prussian municipal system. And finally, the fact that at the head of the several municipal departments, and determining their executive policy, we find a series of experts who are devoting their undivided attention to the gradual development of their particular departments, is of the utmost importance in explaining the admirable methods pursued on the more technical sides of municipal action.

[1] Although Berlin pays 2½ marks per capita, the smaller cities pay a much smaller sum. The per capita contribution is graded according to population.

Through this happy combination of individual responsibility and popular control, the administration of Berlin has reached a degree of efficiency to which perhaps no other of the great cities of the world can offer a parallel.

S. R.

MUNICIPAL GOVERNMENT IN UNITED STATES OF AMERICA (PENNSYLVANIA, PHILADELPHIA). In considering the question of municipal government in the United States, it is necessary to bear in mind the distinction between the American and the continental ideas of the municipality. In the former the municipality is the creature of the legislature, with clearly and minutely defined powers, which form the absolute limits to its action. No general sphere of municipal action, within the limits of which it may exercise its own discretion without the menace of interference on the part of the state legislature, is recognised. On the European continent we find a much broader view prevailing. The law distinctly recognises a field of municipal action, with which the central government can in no wise, or at least only in extreme cases, interfere. The continual interference of the state legislature in municipal affairs has been one of the characteristic features of municipal development in the United States. The large cities have been the greatest sufferers in this respect, and their history and present condition cannot be understood without a distinct recognition of this fact.

The municipal system of the state of Pennsylvania recognises two kinds of municipal corporations;—boroughs and cities. The former is, in general, an incorporated township or portion of a township or townships, with less than 10,000 inhabitants. The cities are for purposes of government divided into three distinct classes.[1] The effect of this division upon the question of state interference in municipal affairs we shall have occasion to examine when treating of the municipal provisions in the state constitution. The three classes above mentioned are as follows:

1. Those containing a population of 600,000 or over.
2. Those with less than 600,000 but exceeding 100,000.
3. Those with less than 100,000.

[1] Act, 8th May 1889, Pa. Laws, p. 133, 1. Act held to be constitutional, see Wheeler *v.* Phila. 77, Pa. 347.

While the differences in the form of government of these various classes of cities are important, the existing organisation of the city of Philadelphia is sufficiently typical to give a general idea of municipal organisation in Pennsylvania. The main differences relate to the number, power, and duties of officers.

In order to understand Philadelphia's present form of government, which only dates from 1887, it is necessary to contrast it with its predecessor. The period of "close corporate" existence, which form had been modelled by Penn in his charter of 1701, after English models, came to an end in 1789, when a modern municipal corporation was created. The history of the city's administration from this period down to its reorganisation in 1887, shows that it was impossible to obtain efficient government with a decentralised system, so long as the attitude of the citizens towards their municipalities remained what it was. The mayor, who was originally a member of councils, soon ceased to be so. The mode of his election also underwent radical changes. At first he was elected by the aldermen; this plan was followed by a system of election by councils; and it was not until 1839 that election by the people was introduced. Nor did the extent of his power remain the same. The period immediately succeeding the introduction of popular election of the mayor marks the greatest change in this respect. Up to that time the mayor had full power of appointment. He was now stripped of this. This was but the beginning of a movement which ended in the degradation of the office of mayor to little more than head of the police system. It received no definite check until the new charter of 1885 came into effect in 1887. The extensive power of appointment, as well as other less important functions, were gradually absorbed by city councils, which during the period under consideration had also undergone a change of organisation. In 1796 the legislative branch of the city government became bicameral; being divided into common and select councils. "They inherited the powers of which the mayor had been shorn, which gave to the local legislature a twofold character; combining within itself both executive and legislative functions." Its methods were that of government by standing committees. A long chapter of the very worst abuses followed, due to the entire lack of an adequate fixing of responsibility in municipal affairs. In 1854 the consolidation of the surrounding suburban districts with the old "city" took place. No changes in the methods of government were effected however, so that Philadelphia continued to suffer from an inefficient, extravagant, and corrupt administration, of which the history of the Gas Trust, so well described by Mr. Bryce in his *American Commonwealth*, is

but one instance. The agitation for a change in the form of government extends over a series of years, and after one defeat in the state legislature, the act for the "Government of Cities of the First Class" known as the Bullitt Bill, was passed in 1885, and came into effect on the first of April 1887.

The fundamental principles upon which this act is based are those which have found expression in almost all the attempts at the reform of city government in the United States within recent years. It is an attempt to definitely fix responsibility by greatly increasing the power of the mayor; giving to him all the powers of an executive, and taking from the councils as far as possible their executive functions.

The legal position of the American municipality in the state makes it necessary, in order to comprehend the city organisation in all its bearings, to examine the state constitutions, which generally contain provisions which may be regarded as complementary to the municipal corporation acts.

In this sense the Pennsylvania state constitution of 1873 served to pave the way for the radical reforms introduced by the act of 1885. It was hoped that a provision effectually prohibiting special and local legislation would be inserted. As a matter of fact we find such a clause in the state constitution,[1] but owing to the very liberal interpretation of the court as to the power of the legislature to divide the cities into classes, the object intended has not been attained, at any rate as regards Philadelphia. Philadelphia is the only city of the first class in the commonwealth, so that general legislation for cities of the first class is in reality special legislation as regards Philadelphia. A further provision of the state constitution which is of importance in the municipal system deals with the question of city indebtedness prohibiting a county, city, borough, or township from maintaining a debt in excess of seven per centum of the assessed valuation of the taxable property therein contained. But even this provision has shown itself of but little importance. It is only necessary for the city to increase the valuation of its taxable property, which in some cases has been done to the extent of 1000 per cent, in order to make the "seven per cent" extremely elastic. Furthermore the county, the city, the general school district, and the ward school district, have each the same power, so that in one city the actual indebtedness might be 28 per cent and still remain in absolute conformity with the legal provisions. The conditions are somewhat different in Philadelphia, where the city and county are co-extensive. Another important clause of the state constitutions is aimed to abolish one of the very worst forms of encroachment upon local self-government, viz., the practice of the state legislature to establish special state commissions entrusted with the execution of municipal improvements and the disbursement of the city revenue. Section 20 of Article iii. provides that "The General Assembly shall not delegate to any special commission, private corporation, or association, any power to make, supervise, or interfere with any municipal improvement money, property, or effects, whether held in trust or otherwise, or to levy taxes, or perform any municipal function whatever." Six further provisions are intended to protect the cities against state legislation on the one hand and local short-sightedness on the other. They may be classified as follows:

1st. Forbidding the state legislature to authorise any local body—be it county, city, borough, township, or other incorporated district—to become a stockholder in any corporation or association, or to lend its credit to such bodies.[1]

2nd. That no such local body shall be authorised to increase its indebtedness by an amount exceeding by two per cent the statutory seven per cent of the assessed property valuation without the consent of the electors at a public election.[2]

3rd. The state government is absolutely forbidden to assume the indebtedness of any local bodies unless such debt be incurred in the suppression of domestic insurrection or to repel invasion.[3]

4th. Upon contracting a debt every local body is required to provide for the annual collection of a tax, in order to meet the payment of interest and the liquidation of the principal within thirty years.[4]

5th. No municipal commission may incur any liability except "in pursuance of an appropriation made therefor by the municipal government."[5]

6th. Every city is required to create a sinking fund which "shall be inviolably pledged for the payment of its funded debt."[6]

With these restrictions and limitations in mind—which at the same time illustrate the American method of dealing with municipalities,—we are prepared to examine the actual provisions of the act of 1st June 1885, which created for the city of Philadelphia in many respects, a new form of government, or at least introduced into it new principles. As we have already seen, the greatest change introduced

[1] Act iii. § 7. "The General Assembly shall not pass any local or special laws, authorising the creation, extension, or impairing of liens; regulating the affairs of counties, cities, townships, wards, boroughs, or school districts; authorising the laying out, opening, altering, or maintaining of roads," etc.

[1] Constitution of Pennsylvania, Art. ix. § 7.
[2] *Ibid.*, Art. ix. § 8.

[4] *Ibid.*, Art. ix. § 10.
[5] *Ibid.*, Art. xv. § 2.
[6] *Ibid.*, Art. xv. § 3.

into the form of city government was in the position of the mayor.[1] It is difficult to understand how the city fared so well under the old *régime*. The city departments were in no way co-ordinated. No unity of purpose and action was possible: continued rivalry and jealousy hampered any general movement for more economical and efficient government; and responsibility was so divided as to make it practically impossible to definitely fix it upon any one person or even one set of persons. This the new city charter has attempted to remedy through greatly increasing the power of the mayor. He is now the real executive of the city government, so that responsibility for the administration is centred in him. This principle was not, however, carried as far as the original framers of the bill had intended. Instead of placing in his hands the appointment of the heads of all the executive departments, as the theory of full responsibility would require, he was only given the appointment, with and by the consent of select councils, of the three most important of these—viz. the director of the department of public safety, the director of the department of public works, and the president and directors of the board of charities and corrections. Through the provision for a department of public safety the mayor has been relieved of what was formerly his main function—*i.e.* the police administration. Through his power of appointment and dismissal, he still retains the general control of this department. He is furthermore required to see that the ordinances of the city and the laws of the state are executed and enforced, to communicate to councils annually a statement of the finances and general condition of the affairs of the city, to recommend to councils all such measures as he shall deem expedient, to call special meetings of councils when required by public necessity, and "to perform such duties as may be prescribed by law or ordinance; and he shall be responsible for the good order and efficient government of the city." In order to make the latter provision effective he is given additional far-reaching powers. He convenes the heads of departments for consultation and advice, and calls upon them for reports; he is *ex officio* a member of all municipal boards, and has the power to dismiss any officer appointed by him. He may disapprove of any item of appropriation bills, whereas formerly he was limited to accepting or rejecting the budget *in toto* as voted by the councils. Whenever he thinks proper he may appoint three persons to examine the accounts of any city department, trust officer, or employee. The mayor is elected by the people for a term of four years, and is not re-eligible for the next succeeding term. He must be twenty-five years of age, and have been a citizen and an inhabitant of the state five years and an inhabitant of the city for the same period previous to his election. Besides the three executive departments already mentioned—of two of which the mayor appoints the heads, and, in the case of the department of charities and corrections, the president and directors,—the charter provides for six further departments, making a total of nine,—viz. the department of receiver of taxes, the department of city treasurer, the department of city controller, the department of law, the department of education, and the sinking fund commission. Of these, it is readily seen that the departments of public safety and public works, of which the mayor appoints the directors, are the most important. Under the former the entire police administration is placed, including the health police, which is under the supervision of a board of health composed of five members appointed by the mayor, with the consent of select council, for a term of three years. Of this board the director of public safety is *ex officio* the president. The building police is in the hands of a board of building inspectors composed of three members appointed by the director of the department of public safety. The department of public works—whose director is also appointed by the mayor, with the consent of select council, for a term of four years—includes the management of the water- and gas-works owned by the city and the distribution of the same; the grading, paving, repairing of the public highways; the construction and repair of public buildings, with the exception of those used for educational or police purposes, bridges, parks, etc.; surveys, engineering, sewerage, drainage; and "all matters in any way relating to or affecting the highways, footways, wharves, and docks of the city." One of the exceptions to the general control of this department, and at the same time characteristic of American methods of municipal government, is the existence of the public building commission, which was created by act of the state legislature in 1870 for the erection of public buildings in Philadelphia. This commission is retained and assured independent existence by the new charter.

The third department, wherein the mayor

[1] The salaries of the more important officials in the city government are as follows:

The Mayor receives	$12,000
Director of Department of Public Safety	10,000
Director of Department of Public Works	10,000
City Comptroller	8,000
City Solicitor	10,000
Receiver of Taxes	10,000
City Treasurer	10,000
Three City Commissioners, each	5,000
Recorder of Deeds	10,000
Registrar of Wills, fees and	5,000
Sheriff	15,000

The last six offices are distinctively county and not municipal offices, but as the city and county of Philadelphia are co-extensive in area, all salaries mentioned above are paid out of a common fund.

exercises wide powers of appointment, is that of charities and corrections, which is under the charge of a president and four directors. It has the management of charities, almshouses, hospitals, houses of correction, and like institutions. The power given to the mayor over the six remaining departments is neither so direct nor efficient, inasmuch as he exercises no power of appointment in their general constitution.

The department of receiver of taxes is in charge of a receiver of taxes who is elected by the people every three years. All officers in any way connected with the receipt and collection of city taxes, licences or fees, are under his direction and control.[1] The department of city treasurer is under the direction of a city treasurer who is also elected for a term of three years. He receives the moneys of all the other departments, and pays all warrants duly issued and countersigned. An important provision of the present charter, intended to correct many former abuses, is that "all the moneys . . . of the city received by any officer or agent thereof, shall be deposited daily in the city treasury."[2]

The most important of the financial departments is that of city controller, at whose head is placed an official elected for three years, and known as the "city controller." His functions are numerous, complicated, and upon their proper discharge depends, to a very great extent, the honest and efficient financial administration of the city. He is charged with the inspection, revision, and auditing of the accounts of the several departments and trusts. No warrant may be paid by the city treasurer unless countersigned by him. He has the financial control of the appropriations made by councils, and is personally responsible for any disbursements in excess of such appropriations. He has furthermore very important duties with regard to contracts. The department of law, which has charge of all the legal business of the city as well as the preparation of all contracts, has at its head a "city solicitor," elected for a term of three years. The sinking fund commission, created in 1857, and composed of the mayor, city controller, and a citizen elected by councils, has the management of the sinking fund for the payment of the city debt. The "department of education," which is under the management of a board of 37 members appointed by the court of common pleas, has general control of the educational system of the city.

We have now before us the executive branch of the city government, viz. the mayor and the various executive departments, the three most important of which are directly dependent upon his choice for their executive heads. In this way the old departmental conflicts have been avoided, as the heads of these departments stand to the mayor somewhat in the same relation as the cabinet to the president of the United States. The position of mayor of Philadelphia has thus been raised to one of high honour and dignity, and it is hoped in this way to attract the very best of its citizens to the office.

Another very characteristic feature of the present city organisation is the position occupied by the legislative branch of the city administration, which comprises a common and a select council. The upper branch or select council is composed of 37 members, one being elected in each ward for a term of three years. The lower branch, or common councils, have 123 members elected in the several wards; the basis of representation being one member for every 2000 taxable voters of the ward. Councilmen must be residents of the wards from which they are elected. Each branch elects its own president, and these in turn appoint the 20 standing committees of councils. The committees consist of 12 members each, 6 from the lower and 6 from the upper chamber. The presidents are members of the standing committees.

Previous to the adoption of the present charter, the inferior position occupied by the mayor found its complement in the almost unlimited power of councils. To correct the abuses growing out of the exercise of executive functions by the legislative branch was one of the main objects the new charter had in view. It aims at restricting councils to legislative, to the exclusion of executive functions. All ordinances directing or interfering with the exercise of the executive functions of the mayor, departments, boards, or heads or officers thereof, are prohibited. Councils are furthermore deprived of all power of appointment, though the appointment of all officers drawing salaries from the city treasury requires the consent of select councils. Still this principle of relieving councils of executive functions has hardly been consistently carried out, for as regards certain city functions, especially the public highways, public sewers, and the like, councils still exercise distinctively executive functions.

Inasmuch as the city of Philadelphia is coterminous with the county, the duties of certain county officers form a portion of the sum total of the administrative work of the city. These are the county judges, pro-

[1] Two departments which seem naturally to fall within this one department have been expressly excluded by the present charter, viz. the board of revision of taxes, and the board of city trusts. The former is composed of three members appointed by the court of common pleas; the latter of fifteen members, viz. the mayor, president of the two branches of councils, and twelve citizens appointed by the supreme court, the district court, and the court of common pleas.

[2] Act, 1st June 1885, Art. vi.

thonotary, registrar of wills, recorder of deeds, clerk of quarter sessions, district attorney, coroner, and city commissioner. It has also been decided by the courts that the city treasurer and controller are to be regarded as county as well as city officers. These officers are all elected by the people at the fall election, whereas the election for municipal offices takes place in the early part of the year. To this rule the prothonotary forms an exception, as he is appointed by the board of judges.

In conclusion it may be said that the changes introduced by the charter of 1885, while hardly realising to the full extent the sound theories of government which the framers had in mind, still mark a great step in advance in the American municipal system. More recently Brooklyn has realised still more fully the principle of executive responsibility centred in the mayor and the restriction of the city councils to purely legislative functions. It is curious to note that while the principle of concentration of power is making itself so distinctly felt in American cities, some of the most efficient continental municipalities have been clearly tending towards a division of executive authority amongst a great number of bodies—committees and the like. It remains to be seen whether the American system which aims to give to the mayor a position of such great importance and authority, will be able to withstand the strain which the rapidly increasing sphere of municipal activity will necessarily place upon it.

MUÑOZ, ANTONIO, is the *nom-de-plume* under which D. Enrique RAMOS (second half of 18th century) published his *Discurso sobre la Economía Política* (Madrid, 1769). His predilection for agriculture displays some leanings towards physiocracy; according to D. Manuel Colmeiro (*Bibl. de Economistas Españoles*) his opinions on cultivation, population, taxation, and trade show discrimination and a sound knowledge of theory.

It was once thought that MUÑOZ was a pseudonym of CAMPOMANES (*q.v.*), but this opinion has been abandoned. E. Ca.

MÜNSTER, SEBASTIAN (1489-1552), was originally a Franciscan monk, then a teacher at the universities of Heidelberg and Basle.

He wrote in 1540 a German, and in 1550 a Latin, edition of his *Cosmographia Universalis*, which remained a standard book until the 17th century was already far advanced. Roscher (*Gesch. der Nat. Oek.*, p. 96), describes it as a collective work remarkable for its encyclopædic aims, the accuracy of its information on foreign countries, and the real insight it displays into the economic condition of the latter. E. Ca.

MURATORI, LUDOVICO ANTONIO (1672-1750), born at Vignola (Modena), a great man in Italian history and literature. His life, first in Milan, then in Modena, was given to study. He was a priest, and the author of many writings, among which the most noteworthy are: *Antiquitates italicæ medii ævi*, Milan, 1738-1743; *Rerum italicarum Scriptores*, Milan, 1723-1738 (xxvii. vols.); and *Annali d' Italia*, Milan, 1744-1749. Recently the importance of Muratori in economics has been recognised. Many of his writings touch upon economics, in the numerous investigations they contain on the economic conditions of mediæval civilisation, the condition of industry, trade, agriculture, and colonisation.

From the point of view of theory, Muratori's ideas on economics are neither original nor profound. He does not understand the nature and character of the laws of value, and, above all, he falls into the grosser errors of mercantilism regarding money and commerce. He confuses the nature and economic use of money, and advises a prince, in order to make his country prosperous, to do all in his power to get as much money as possible into the country and let as little as possible go out. As regards commerce, he combats the prohibition of import of foreign goods, high import duties, and privileges granted to producers in a country to promote its industries. He also advises restrictive measures in the interior. Though failing to understand thoroughly the deeper phenomena of economics, Muratori's mind, better suited to the analysis of historical facts than to economic deductions, succeeds most in researches relating to economic and financial policy, grasping firmly the relations between civil and political institutions and social conditions. Thus Muratori points out the baneful effect of very large holdings, of entails, and of committing properties to trustees. He studied taxation, and went deeply into the question of charity. In his writings on charity he ascribed much importance to benevolent works carried on by the prince of a country to provide for the happiness of his subjects, and studied, from a practical point of view, the organisation of charitable institutions to enable them to attain the object desired. For economists, Muratori's most important works are: *Della carità cristiana* Modena, 1723.—*Rudimenti di filosofia morale*, Modena (undated, probably about 1735).—*Trattato della pubblica felicità*, Modena, 1749.

[On Muratori as a literary man and historian there is an entire library. On Muratori as an economist, see E. Masè Dari, *L. A. Muratori, come economista*, Bologna, 1893.—A. Graziani, *Le idee economiche degli scrittori Emiliani e Romagnoli*, Modena, 1893.] U. R.

MURDRUM. This term was applied in Norman times to any secret murder, when the

criminal could not be discovered. William I. found it necessary to prevent the assassination of his Norman followers by special penalties. It was accordingly enacted that if the body of a murdered man were found and the murderer was unknown, either it must be proved that the dead man was an Englishman, or else a heavy fine was imposed upon the hundred in which the body was discovered. This is sometimes called the law of Englishry. In course of time the term *murdrum* was extended from the offence to the fine levied on the district. By the time of Henry II. the distinction between Norman and Englishman had become so obscured by intermarriage that the law could no longer be enforced in the old sense. The only class that remained distinctly English was that of the villeins, and therefore the *murdrum* was not exacted unless it could be proved that the dead man was a villein. As the motive which had led to the law had now disappeared, the penalty soon became obsolete.

[*Dialogus de Scaccario*, i. c. x.] R. L.

MURRAY, Robert (b. 1635), writer on trade, banking, and national revenue. His *Proposal for the Advancement of Trade* started from the position that as the circulation of money was stagnant and depressed trade, the circulation should be increased by using credit instead of money: storehouses on a kind of public pawnbroking basis were to be provided, in which traders were to deposit their "dead stock" at 6 per cent. per annum, and credit notes were to be issued on these goods at $\frac{2}{3}$ or $\frac{3}{4}$ of their then market value. Murray assumes that there will always be a steady market value for "dead stock" when convenient to the proprietor to sell. This assumption vitiates most of his economic suggestions. The *Proposal for the Better Securing our Wooll against Exportation* is based on a protectionist policy, and is a plea to revive and enforce the laws of the staples. All the unemployed are to be set to work, on a credit basis, in growing and working up wool, the object being to find a market by underselling and beating the foreign merchants out of the field. The *Proposal for a National Bank* was inspired by the basis, on public security and under public control, of the Bank of Amsterdam. Murray wished to see a similar bank established in the city of London, "so constituted that no little private sinister ends can possibly be advanced to the public detriment,"—he had failed to grasp the importance of the Bank of England established in the previous year (1694). Murray's bank was to be established on securities in land "or any other valuable securities or depositums"; it was to supply a public need, to remit money at safe and reasonable rates by means of cheques, and to discount bank, foreign, and inland bills. The *Reasons . . for Translating the Duty of Excise from Mault-Drinks to Mault*—a change which Murray considered would affect no one but the "consumptioner,"—is only worthy of notice owing to the plea for Free Trade towards the end. The government is asked to "take off all customs for import and export, except of such goods where the duty laid is intended to amount to a prohibition; this may make England become a free port, the great and good effects of which are too many and too obvious to stand in need to be repeated. This alone . . . will effectually secure our African and East India trade from any whatsoever competitors." In the *Proposal for . . . Advancing to the Crown any Fixed Sum*, etc. he suggests that the state shall issue bills of credit upon Tallies of Pro, struck upon a fund to be formed by settling some branch of the royal revenue to be charged by act of parliament with an annual payment for a limited term, *e.g.* £400,000 for eleven years, or £200,000 for twenty-two years, the bills to range in value from £5 to £100, and to be accepted as legal tender in trade, etc.

The following works were, so far as stated, all published in London:—

A Proposal for the Advancement of Trade upon such Principles as must Necessarily Enforce it, 1676, fol. pp. 7.—*Composition Credit, or a Bank of Credit made Current by Common Consent in London, more Useful than money*, 1682.—*Account of the Constitution and Security of a General Bank of Credit*, 1683.—*A Proposal for a National Bank, consisting of Land, or any other valuable Securities or Depositums; with a Grand Cash for Returns of Money, etc. . . . the whole to be under the Care, Inspection, Trust, and Controul of the Publick Authority, and Legal Magistracy*, 1695, sm. 4to, pp. 4 and 8.—*A Proposal for the Better Securing our Wooll against Exportation, by Working up, and Manufacturing the same. With the Method and Manner of Setting and Keeping the Poor in Constant and Full Employment. . . . Under the Government of such of the Principal Nobility and Gentry . . . who are willing to undertake so Good and Pious a Work*, n.d. (? 1695), sm. 4to, pp. 4.—*A Proposal for the more Easie Advancing to the Crown any Fixed Sum of Mony, to carry on the War against France; And Payment of the Debts Contracted thereby*, n.d. but probably 1696.—*Reasons Humbly Offer'd to the Honble. House of Commons, for Translating the Duty of Excise from Mault-Drinks to Mault; whereby may be Advanced to the Crown above Twenty Millions, for Carrying on the War against France*, n.d. sm. 4to, pp. 4 (another edition with slightly different wording).—*An Advertisement for the more easy and speedy collecting of Debts*, n.d.

[M'Culloch, *Lit. Pol. Econ.*, p. 159.—*Dictionary of National Biography*, art. "Murray, Robert."]

MURRAY, William. See Mansfield, First Earl of.

MUSCOVY CO. See Russia Co.

MUSHET, ROBERT (1782-1828), entered the royal mint about 1804. He became a recognised authority on the currency question, (see BULLION COMMITTEE, REPORT OF), and gave evidence before the committees of the Houses of Lords and Commons which sat in 1819, on the resumption of cash payments.

His works comprise *An enquiry into the effect produced on the national currency and rates of exchange by the Bank Restriction Bill*, 3rd ed. corrected and enlarged, London, 1811, 8vo, in this a seignorage of 10 per cent on the silver coin is recommended, and an arrangement for the management of the silver currency.—*Tables exhibiting the gain and loss to the fund-holders arising from the fluctuations in the value of the Currency from 1800 to 1821*, 2nd ed. corrected, London, 1821, 8vo, the best history of the variations between the value of the gold coin and the paper in circulation at this period.—*An attempt to explain the effect of the issues of Bank of England upon its own interests, public credit, and county banks*, London, 1826, 8vo.

[*Dictionary of National Biography*, vol. xxxix. p. 430.—See also Ricardo, *Letters to M'Culloch*, ed. by Hollander, American Econ. Association, vol. x. pp. 111-113, 1895. Ricardo criticised the *Tables* and Mushet incorporated his suggestions in 2nd ed. 1821.—*Reports from, and evidence taken before, the Committees of the Houses of Lords and Commons on the expediency of the Bank of England resuming Cash Payments*, 1819.] H. E. E.

MUTUAL INSURANCE. See INSURANCE, MUTUAL.

MUTUUM is one of the *real* contracts of Roman law. It is a contract of loan which is created by the lender delivering to the borrower a thing of an exchangeable kind, "*res fungibilis*" (see FUNGIBLES), such as money, so as to make the borrower owner of it, on the express or implied understanding that an equal quantity of the same kind of thing is to be returned. The lender cannot claim interest on the loan unless he makes a special contract distinct from the *mutuum*, entitling him to do so. It is distinguished from COMMODATUM, where the actual thing lent is the thing to be returned (see also LOAN, CANONIST DEFINITION OF). E. A. W.

Sir Francis Palgrave, K.H., and Elizabeth, Lady Palgrave

HIS PARENTS, TEACHERS, FRIENDS

THIS WORK IS DEDICATED BY

R. H. INGLIS PALGRAVE

PREFACE

THE aim of this work is the assistance of the English-speaking student of Economic Science to the better understanding of the questions in which he is interested. These questions, while dealing with matters of ordinary life, are often more abstruse and intricate than appears to a superficial observer, and they require careful thought and study to unravel.

The performance of this task, difficult and laborious enough in itself, has not been rendered more easy by the fact that the work has to cover an absolutely new field in English literature. There exists at the present time no completed work in our language which exactly fills the same place, or which could in any way serve as a guide. The laborious commencement made by MacLeod extends only as far as the letter C. The *Standard Library Cyclopædia of Political, Constitutional, Statistical, and Forensic Knowledge*, 1860, does not cover the same ground; nor does the *American Cyclopædia of Political Science, Political Economy, and United States History*, 1888, undertake what has been attempted here. In the French and German languages there are very valuable works on the subject, among which may be cited the *Dictionnaire de l'Économie Politique*, edited by Coquelin and Guillaumin, 1853; the *Nouveau Dictionnaire d'Économie Politique*, edited by Léon Say and Joseph Chailley, 1891; the *Dictionnaire des Finances*, edited under the direction of Léon Say by Louis Foyot and A. Lanjolley, 1889; and the *Handwörterbuch der Staatswissenschaften*, edited by Conrad, Elster, Lexis, and Loening, the first part of the first edition of which was published in 1890, the second edition having been commenced in 1898. These works have been studied and their arrangement considered. But the dictionaries which cover the corresponding ground in other languages, though written by very competent and erudite men, could not serve exactly as models for a book intended for the English student, whose requirements had particularly to be provided for. Yet, although specially written for the English-speaking races, it is believed that this book may claim that international or cosmopolitan character which should mark any work on economic science; for, among the contributors, besides the many very able English, are numbered some of the most distinguished American and foreign Economists.

I now thankfully bring my work to a conclusion, greatly indebted to the consideration of my publishers, Messrs. Macmillan and Co., who have kindly waited till a book, promised, with a sincere expectation of fulfilment, in three years, has

been completed in the twelfth year, and who have also, greatly to the advantage of the reader, allowed an extension of space from two volumes to three, thus permitting a greater fulness of treatment than could otherwise have been possible. The time spent in the actual construction of the work represents, however, but a comparatively small part of that period during which it has been the subject of my thoughts, a period which covers a very large part of my life. And yet after these years of labour I am most deeply conscious not only of omissions but also of imperfections inevitable in a work of this description.

I may now turn, and with more pleasure, to an explanation of the plan which has been followed. It was obvious that the limits of space did not permit an absolutely exhaustive treatment of most, if of any of the subjects contained in the Dictionary. Each heading, however, has been dealt with as fully as possible. Every effort has been made to give the most complete information attainable by means of cross-references to the other articles contained in the work which take up different portions of the subject and will thus assist the reader. Clearness has not been sacrificed to the exigencies of space. Where, indeed, clearness could not be attained without employing some considerable space or even some repetition, this has been allowed, and, equally wherever possible, care has been taken to supply an adequate bibliography of each subject.

It is thus hoped that the Dictionary will assist the student to carry out any special investigation, by giving him some preliminary information, and by referring him to the best authorities. In selecting these authorities, while due attention has been given to the more important writers, reference has also been made to many whose works, valuable in themselves, are less generally studied, and who may perhaps have only contributed a monograph on the particular subject under notice. The works of men comparatively unknown, remote from us through the countries where they lived or the period when they wrote, are often of considerable service in elucidating particular cases or illustrating special points in history. The same principle has been applied to the biographies. Considerable attention has been given to the less known writers, for the same reason. It is easy for the student to find out all that he requires about the works of the more celebrated men, while he frequently finds it difficult to obtain information about the more obscure, a knowledge of whose investigations, however, may be necessary to him. Better that fifty should consider an explanation superfluous than that one should find a difficulty unsolved.

It may be claimed for the Dictionary that it contains many examples of original research into the literary history of unknown English worthies whose writings have not hitherto been adequately discussed. The biographical articles have been confined to notices of writers no longer living with the single exception of Prof. Léon Walras, who so closely carried on the work of his father Prof. Antoine Walras that it was not possible to mention the latter without also describing the works of his son. The works of authors now living are quoted in connection with the subjects which they elucidate.

The turn which the study of economics has taken in recent years has necessitated corresponding developments in this work. The historical side of the study

has been constantly remembered as well as the more recent effort to gain greater exactness through the employment of mathematical methods.

In connection with the first branch of the subject, articles will be found both on the Historical Method and on the Historical School of Economists. The early history of economic movements has been explained with reference both to theory and to practice, as in the articles on the Canon Law and Gilds, and the Mercantile System—all of which may be claimed as still having survivals in modern thought. Some space also has been devoted to short histories, as of the trading companies formerly so powerful in this country, and of the Hanseatic League, whose influence on the continent of Europe extended so widely.

In connection with the employment of mathematical methods the use of Diagrams is also explained, as well as the Graphic Method. These articles show the use which may be made of Diagrams both in abstract theoretic exposition and in the explanation of concrete economic phenomena. A practical application of these methods for the use either of students or business men will be found in the article on Polegraphy, the name given to a graphic method recently devised to enable those concerned to obtain a clear view for practical purposes of complex combinations of operations either on the stock or produce exchanges. This article contains, it is believed, the first explanation of this method available for the English reader.

Whatever method we use we must ever bear in mind the necessity of constant, careful, and exact observation of facts. We must "classify our facts before we generalise, and seek for narrower generalisations and inductions before we aim at the highest."

As the limits of space compelled concentration, and this work is intended mainly for the service of students among the English-speaking peoples, the developments of economic thought in other countries, however interesting, have necessarily not received the same fulness of treatment as those which have taken place within our own shores. Yet these subjects have not been neglected.

The Dictionary contains, it is believed, the first attempt which has ever been made in a work of this description to give, under separate heads, an account of the labours of the principal writers and the characteristics of the different schools of economic thought throughout the civilised world.

The work of the economic Schools of England, in which last we may include the growing and powerful body of thinkers in America; the labours of the Schools of Austria, of France, Germany, Holland, Italy, Russia, and Spain, have thus formed the subjects of separate articles. These may be commended to the special attention of the reader. They will help him to understand the various modifications of doctrine and opinion which the study has undergone. And if, in all cases, opinions are not agreed, much may be ascribed to the different requirements of national life in different countries.

The student who examines these articles will find that he is able to carry his investigations further by means of the separate notices of the principal writers named, and of the special subjects to which reference is made.

Thus the reader of the article on the French School will have his attention called to the writings of the many able Frenchmen who have written on Economics,

to the work, for example, of the Physiocrats, and their organs, the *Éphémérides* and the *Nouvelles Éphémérides*—the only known complete set of which was liberally placed at the disposal of Dr. Bauer, who wrote the article on that subject. The many important writers referred to in the article on the German School show, especially in recent years, the influence of the great German thinkers, Kant, Fichte, and Hegel, who, though they can scarcely be claimed as economists, yet influenced and modified economic thought far beyond the boundaries of their own country. The student of Economics will do well to examine these articles carefully, as well as those on the Italian, Russian, and Spanish Schools.

These articles contain much information on points in the economic development of the countries concerned, which may be new to the readers of the Dictionary. In our own country, to give merely two examples, the spirit of enterprise which has marked British character and peopled British colonies has been largely influenced by the English Law of Wills, which has fostered the energetic side of life through the necessity for hard work. A reference to the articles on this subject will show how completely the English law differs in principle from the law of other European countries, and how far more free in this respect the power of bequest in this country is. Again as to agricultural matters it is well to be reminded that in our older English land-holding system the leases for a long term, formerly possessed by English yeomen, helped to develop a class whose existence strengthened an interest of the highest economic importance to the country.

The plan of the work has been set out all through as broadly as possible. Due consideration has been given to theory and method. That so often misinterpreted expression, the Laws of Political Economy, is explained—that these are not rules to be obeyed but scientific uniformities. There are also articles on the Method of Political Economy and on Political Economy itself, with explanatory articles on the main headings into which Economic Method is divided.

The practical side of Economics also has not been neglected. Articles are given on Business subjects, on Banks, Clearing Houses, Commercial Crises, Docks, Railways, Insurance, Bills of Exchange, and the Precious Metals, with a summary of recent events in Silver Legislation in the United States.

The use of statistics is also explained, with articles on the kindred subjects of Index Numbers and the Tabular Standard.

Financial subjects are dealt with, including Taxation, which, according to the manner in which it is levied, exercises so vast an influence on the welfare of a country. Articles will be found on the National Debt, on the Budget, on Finance generally, on Export and Import Duties, on the Income Tax both in England and abroad, on Graduated Taxation, on Death Duties, on Taxation as a whole, on the Internal Customs formerly in use in France, and on Octroi Duties.

But levying taxation, though one of the most important, is not by any means the only manner in which the powers exercised by legislation influence the welfare of a country. Government regulation of Industry, the Factory Acts, the laws affecting Labour generally, may be mentioned as subjects dealt with in this connection.

Perhaps in the legislation on the poor law the influence of economic thought is more perceptible than in any other branch of our administration. A reference to the economic writers of all ages and of all countries who have dealt with questions of charitable relief, and whose biographies will be found in these volumes, will show how universal the difficulty of assisting the poor without pauperising them has always been. The charitably-disposed have often had to deplore the injury which well-meant efforts have inflicted on those for whom help was intended.

The study of these volumes themselves will supply many and complete examples of what has briefly been recapitulated here. I venture to bring to an end this explanation of the object and scope of my work with a passage from one of my father's oldest friends, Mr. Henry Hallam, which I well remember reading with much interest in years past, little as I imagined then how closely it would describe my own feelings at this time.

"An author who waits till all requisite materials are accumulated to his hands, is but watching the stream that will run on for ever; and though I am fully sensible that I could have much improved what is now offered to the public by keeping it back for a longer time, I should but then have had to lament the impossibility of exhausting my subject. ΕΠΟΙΕΙ, the modest phrase of the Grecian sculptors, well expresses the imperfection that attaches to every work of literary industry or of philosophical investigation. But I have other warnings to bind up my sheaves while I may,—my own advancing years, and the gathering in the heavens."

In conclusion I have to express my sincere thanks to those who have assisted me by contributing to these volumes, and who have taken pains and trouble of which only the Editor can be aware. Specially my thanks are due to Dr. James Bonar, Prof. A. Caldecott, Prof. F. Y. Edgeworth, Mr. Henry Higgs, Dr. Ernest Schuster, and Mr. H. R. Tedder, who have helped in many ways as well as in preparing the work for the press, and to Miss Ethel Faraday for the labour and great attention she has bestowed on the Index.

My earnest hope as Editor is that this work may promote and facilitate the study of sound economic doctrine, the knowledge of which is essential to the lasting prosperity of our country.

R. H. INGLIS PALGRAVE.

BELTON, NEAR GREAT YARMOUTH.
Midsummer, 1899.

La Filosofia è scritta in questo grandissimo libro, che continuamente ci sta aperto innanzi agli occhi (io dico l'Universo), ma non si può intendere, se prima non s'impara a intender la lingua, e conoscer i caratteri, nè quali è scritto.—GALILEO, *Il Saggiatore. Opere*, vol. vi. (ed. 1811), p. 229.

As in going of a way we do not only gain that part of the way which is passed, but we gain the better sight of that part of the way which remaineth; so every degree of proceeding in a science giveth a light to that which followeth. — BACON, *On the Advancement of Learning*, vol. iii. p. 392 (Ellis and Spedding ed., 1857).

In short we are very greatly in want of a Johnson's Dictionary of Political Economy, and possibly it may be in reserve for some young man, now of twenty years of age, to supply the deficiency by the time he shall be five and thirty.—*Lectures on the Nature and Use of Money*, by JOHN GRAY (Edinburgh), 1848, p. 96.

DICTIONARY OF POLITICAL ECONOMY

NAPOLEON—NATION

NAPOLEON (Coin). The twenty-franc piece of France, issued during the reign of Napoleon I., bears that ruler's name. It is a gold coin of the millesimal fineness of 900, weighing 99·56 grains; its value in sterling is 15s. 10½d. (see Franc). F. E. A.

NASSE, Erwin (1829-1890), a distinguished economist, was born at Bonn, and studied there and at Göttingen. He was appointed professor at Basel in 1856, and within the same year at Rostock; in 1860 he became professor at Bonn. He took an active part in political affairs, and sat as a member of the Prussian house of representatives from 1869 to 1879. His most important publications were: *Bemerkungen über das preussische Steuersystem*, 1861;—*Die preussische Bank*, 1866;—*Ueber die mittelalterliche Feldgemeinschaft und die Einhegungen des 16. Jahrhunderts in England*, 1869 (translated into English by Col. H. A. Ouvry, and published by the Cobden Club in 1871, 2nd ed., 1872); *Geld und Münzwesen* in Schönberg's *Handbuch* (2nd ed., 1886); and *Das Sinken der Warenpreise während der letzten fünfzehn Jahre*, 1888. From 1874 till his death Professor Nasse was president of the *Verein für Sozialpolitik*, of which he had been one of the founders. He was associated with Ad. Wagner in the new edition of Rau's *Lehrbuch*, but his collaboration seems to have been, for the most part, merely nominal. He supplied to the *Verein für Sozialpolitik*, in vol. iii., "Die Personalbesteuerung," and in vol. xxvii., "Agrarische Zustände in Frankreich und England." He wrote largely on currency, banking, state-credit, prices, and taxation, contributing many articles on these subjects to economic and other journals. His memoir on the well-known work of "W. Stafford" is of special interest (Zeitschr. d. Staatsw., vol. xix.) (see W. S.). His writings are marked by cautious exactness and moderation. In his general views he was one of those somewhat loosely described as Socialists of the Chair (*q.v.*). He warmly eulogises the *Verein für Sozialpolitik*, which was created by that group of economists, as having been the product of the moral conscience of almost all Germany, and as having profoundly modified in a right direction the tendencies of public opinion. He insists on the insufficiency of a free field to individual interests, and the necessity of the application of moral ideas to the national economy through the action of the state (Lippert in *Handwörterbuch der Staatswissenschaften*). J. K. I.

In addition to his eminence as a general economist, Nasse is of particular importance in the history of economic thought for three reasons. His special studies in money, credit, and banking institutions, etc., have won for him a very high place as a monetary critic. In two other respects he must be regarded as a forerunner of movements which have now become very important. He was one of the early and professorial socialists, and did much to modify the mechanical and harsh direction which economic theory had assumed. In addition his studies in the Three Field System in England, though its conditions have been subject to much correction, drew attention to a valuable side of economic study. His remarks in this connection display considerable acumen, and though his methods and erudition have been severely criticised, he deserves great credit for seeing at an early stage the necessity of treating many problems from a historical rather than an abstract standpoint. E. C. K. G.

NATION. This word is used in a loose sense to signify any considerable aggregate of human beings, living together in one country, or under one rule. They are generally assumed, with more or less accuracy, to be of one race; but if other bonds are sufficiently powerful to have the same uniting effect as those of blood, the community so held together is regarded as a nation, though its people may spring from various stocks. Thus, we call the Swiss a nation, as well as the French, the Germans, and the Italians. Yet in Switzerland there are French cantons, German cantons, and Italian cantons, in which, not only do the bulk of the people belong to the stock indicated by the name, but they speak the French Ger-

man, or Italian language, as the case may be. The inhabitants of Switzerland are of different races, and use different tongues; but the political ties between them are so strong that they are constantly referred to as a nation. On the other hand, we often find that in common discourse governmental bonds are neglected where the term we are considering is used. No one calls the people of the Austrian empire a nation, though they all owe political allegiance to the occupant of the throne of the Hapsburgs. The usual phraseology describes Austria as a state made up of a number of nations or parts of nations—Germans, Magyars, Slavs, Poles, etc. Between the two ideas, that of blood-unity and that of administrative unity, ordinary speech hovers. The same person who has just mentioned Germans as one of the nations of the Austrian empire, will go on to maintain that the realisation of German unity under the Hohenzollerns in 1871 gave the German nation a leading position in Europe. In the first case he will be thinking of race only; and in the second, of race plus political allegiance. In fact, there is no generally received definition of a nation. Common descent, common language, common history, common religion, common interests, common ideas, hopes, and aspirations,—all these enter more or less vaguely into the current conception, but any one of them may be wanting, or two or three of them may be absent together, and yet the community which lacks them may be called a nation. Its people must, however, possess what Renan rightly regards as essential to nationhood, a common heritage of memories and feelings, and a present desire to continue their common life. A curious reversal of ordinary practice is furnished, at least as far as formal and official terminology goes, by the United States of America. Its people cherish in a remarkable degree the characteristics enumerated above, but their written constitution nowhere applies the term *nation* to them; and a few years ago, a proposal to introduce into the liturgy the versicle "O Lord, bless our nation," was defeated in the convention of the American Protestant Episcopal Church (see Bryce, *American Commonwealth*, ch. ii.). But it must be added, that in common speech and writing the Americans constantly call themselves a nation. If it be necessary to assign a technical meaning to a term so loosely used in ordinary discourse, we may perhaps conveniently define a *nation* as a community whose members are bound together by ties of blood, speech, feeling, and interest, such as do not subsist between them and the rest of the world, and who are also under a common government. This leaves us the term *nationality*, for aggregates of human beings who feel the ties referred to, but do not form one political whole (see NATIONALITY), and enables us to distinguish a *state* from a *nation* or a *nationality*, by laying stress upon the mere fact of political authority without reference to the conditions under which it is exercised (see INTERNATIONAL TRADE).

NATIONAL BANKS (U.S.). See BANKS.

NATIONAL DEBT.

1. Introduction, p. 2; 2. National Debt of United Kingdom, p. 3; 3. The Funding System, p. 4.

1. *Introduction.*

The economic evolution of the system of borrowing by the state proceeds along the same lines as the development of commercial credit in the community. The system of accumulating treasure against unforeseen emergencies was adopted by the ancient world, and is not unknown at the present time. Forced loans were the favourite expedient of mediæval monarchs. Anticipation, or pretended anticipation of taxes was the next step. As industry and independence increased, the despotic methods of the middle ages became intolerable. The growth of private credit suggested the use of public credit; the growth of public debt naturally followed. Holland, as the logical result of its advanced commercial development, was the first nation to contract public debt systematically. England and France followed more slowly. States whose commercial history, if not their existence, is more modern, have found a facility of incurring national debt ready made, so to speak, for their adoption. Consequently this method of acquiring ready money without trouble has been grossly abused, especially by the South and Central American Republics, which obtained large loans without the possibility of paying them, and for purposes utterly wasteful and corrupt.

The general questions of the gradual rise of public borrowing, its effects on industry and thrift, the policy of borrowing in national emergencies rather than increasing taxation, are explained in the article on DEBTS, PUBLIC; a very good statement of them will also be found in M'Culloch's *Taxation and the Funding System* (1st ed., 1845).

(*a*) It is sometimes suggested that a national debt should be permanent. But it is essential to pay it off as soon as possible. The old theories as to the benefit of having a large debt for purposes of investors are not yet exploded in commercial circles, but no economist could be found to support them. On this head see the essay, referred to below, in which Sir R. Giffen showed the propriety of making a serious effort to reduce the national debt of Great

Britain. With increasing population and wealth in any given country, the burthen of a debt previously incurred becomes proportionately less, and its repayment would therefore become easier. It is, however, matter of history that but few countries which have once incurred a debt have made the necessary effort to repay it. The reduction of the debt of the United States is the most striking instance of the recognition of this public duty: but in this case rapid development made the task specially easy. The high credit of many of the British colonies is partly due to the fact that from an early period in the currency of a loan provision is being made for its ultimate repayment. This point will be treated of under SINKING FUND.

(*b*) What is to be considered a heavy debt? The usual test is to compare the debt per head of population in various countries. This is done exhaustively in the article on DEBT, PUBLIC, STATEMENT OF. But it would probably be safer always to compare the proportion of the debt and debt-charge to the annual revenue. Even this fails, for a wealthy people can raise a given annual revenue with much less effort than a poor people. The real burthen of debt is a subject for close local inquiry.

The term "national debt," has been confined in practice to denoting debt owing from a state as an international unit to its own subjects or to foreigners. But debts incurred by municipalities and other local bodies are equally burthens on the industry of the nation; and there are few civilised nations which have not contracted some such. In the case of Great Britain such debts amount to about £260,000,000, or 31 per cent of the national debt proper; in the Australian colonies to at least £11,500,000, or 5¾ per cent of the public debt.

2. *National Debt of United Kingdom.*

Probably the last of the forced loans under the privy seal was obtained by James I. in 1604. After the Restoration the favourite method of raising loans was by the issue of tallies in anticipation of revenue. When William III. became king the only recognised debt was £84,888 : 6 : 9, borrowed on tallies in anticipation of duties on French linens. The increase of debt during his reign, which is amply capable of justification, led to "tallies of fictitious loans," and the issue of annuities for lives and terms of years, as well as to the creation of the permanent form of funded debt which gradually superseded all other methods. The low state of public credit at this time is illustrated by an unsuccessful attempt in 1692 to borrow one million on annuities for ninety-nine years at 10 per cent for eight years, and 7 per cent for the remainder of the term. William's government, however, took the first steps to establish public credit: the "banker's debt," raised and repudiated by Charles II. (see EXCHEQUER, CLOSING OF), was finally made part of the national liabilities in 1699: the Bank of England debt, which had its origin in this period, brought ulterior benefits with it.

The following figures account for the greater part of our national debt.

Incurred during William III.'s reign (1688-1702) .	£15,730,439
Anne's reign, war of Spanish succession, etc. (1702-13) .	37,750,667
American War (1775-86) .	121,267,993
French War (1793-1815) .	603,842,171

During the whole period the obligation of repayment was more or less borne in mind; but the net result of the operations in this direction was not very effective (see SINKING FUND).

The national debt of the United Kingdom, as it has stood during the last century, is composed of funded and unfunded debt.

(*a*) The funded debt comprises the debts on account of Bank of England and Bank of Ireland stock, and the South Sea and old East India companies, each of which has an interesting history. It reached its highest point in 1817, when it stood at £796,200,191 (the unfunded debt making up the total national debt of £848,282,477): since that time it has fairly steadily decreased except during the Crimean war. It stood in 1894 at £634,707,994, including the TERMINABLE ANNUITIES. Several schemes of recent years have been directed towards the reduction of capital or interest: the chief of these are the conversion of certain portions of the debt into terminable annuities and Viscount Goschen's conversion schemes of 1888-89, which chiefly affected the annual charge of debt. The national debt commissioners, first constituted under an act of 1786 (26 Geo. III. c. 31), the members *ex officio* being the Speaker of the Commons, the Chancellor of the Exchequer, the Master of the Rolls, the Paymaster-General, the Governor and Deputy-Governor of the Bank of England, have under them a permanent department, which is charged with the management of annuities and the purchase and cancellation of portions of the debt.

(*b*) The unfunded debt consists of issues of loans for short periods now usually made in order to supply the wants of the state in anticipation of the incoming of the ordinary revenue. It is often referred to as "FLOATING DEBT." It is created in three forms (1) EXCHEQUER BONDS, which have currency for a fixed term of years, not now usually exceeding three, but were first issued in 1853 with a currency of forty years. (2) EXCHEQUER BILLS which run for a few weeks or months as a minimum, and are thereafter liable to be called in at any time. (3) TREASURY BILLS, which are not very dissimilar

from the preceding class. The essential difference between Treasury bills, Exchequer bills and bonds, and funded government securities, is that on the former the State contracts to pay the principal as well as interest, and on the latter the interest only. The amount of unfunded debt in 1894 was £21,446,300 against a funded debt (excluding annuities) of £587,631,096; the average of the three years 1890-92 was over £34,000,000, or more than double the average of the seven previous years. But in the first quarter of 1892-93, £13,000,000 of the floating debt was funded.

The annual *Statistical Abstract* gives an interesting table showing the movement of the debt during the previous fifteen years. In 1880 the aggregate net liabilities of the United Kingdom were £739,501,605, in 1890 they were £684,954,150, and 1894, £664,163,141. The South African War and trouble with China increased this amount to £770,778,000 by 1903, reduced in 1907 to about £743,306,000.

3. *The Funding System.*

Any sketch of the history of Great Britain's debt would hardly be complete without some more particular reference to this term. The term "to fund" properly meant nothing more than to undertake a liability for the debt which in point of time should be indefinite, and therefore practically permanent; and to record it as such in the accounts of the state. This term apparently came into use in this country in the latter part of the 17th century, so that the popular title of "the funds" may be considered contemporaneous with our national debt itself. But in practice it became common in the early part of this century to associate the term with undertaking the liability for a greater nominal amount of debt than the amount actually lent to the state; and it was this form of inducing persons to lend money to the state which is specially indicated in the term "funding system." This expedient, resort to which was the natural result of the difficulty of raising loans, appears to have been first adopted in the year 1758: it afterwards became popular. The excess of capital liability incurred by the plan amounted to 75 per cent of the loans raised in 1781 when, in return for £12,000,000 in cash, the State issued stock to the amount of £18,000,000 at 3 per cent and £3,000,000 at 4 per cent, or £21,000,000 in all; this seems to have been the greatest of such excesses. This was the method which gave its particular meaning to the words "funding system"; but it was a mere accident of the system, and not of its essence. The method concentrated a great deal of criticism on itself, and was usually charged with gross extravagance (see M'Culloch's *Taxation and the Funding System*, pt. iii.): but to support the charge, it would be necessary to examine all the circumstances which bore on each issue of a loan. The commercial principle on which it is based is seen daily at work in the stock exchange prices, which are usually below or above par. Further it is constantly adopted in inviting tenders for colonial or foreign loans where subscriptions are called for at a minimum of say £96 or £98 for every £100 stock: and of the colonial loans at any rate it may safely be stated that all future as well as present contingencies are considered before such minimum prices are fixed; considerations of the rate of interest are of course a potent factor.

The amount of cash received for an obligation has an important bearing on the morality of writing down the nominal capital of the loan in the case of a poor state. For a full statement of the debts and charge of debt of the British Empire and foreign countries, see article on DEBTS, PUBLIC.

Excellent statements of the growth of the debt are found in *Fenn on the Funds*, and full information on many points in a *House of Commons Return* of 1869, 366, i., app. No. 13.—*Parl. Returns of the National Debt*, especially 443 of 1858, 366, i. of 1866, 312 of 1894.—Bastable, *Public Finance*.—Adam's *Public Debts*.—Giffen's *Essays in Finance*, 1st Series, Essay xi.] C. A. H.

NATIONAL DEBT, REDEMPTION OF. See REDEMPTION OF NATIONAL DEBT.

NATIONAL ECONOMY (and the German terms *Staatswirthschaft* and *Volkswirthschaft*, more or less equivalent to it) is used by many economists to designate that stage of development in which the economic life of an entire nation, or state, forms a united whole. It is distinguished from the preceding stages of a *territorial* or *provincial* economy (or, where a country did not go through that experience, of a *town* economy), and from the stage which may possibly follow in the future, of an *international* economy. Different writers lay stress on different characteristics; some, like Schmoller, upon the national regulation of industry and trade; others, like Bücher, upon the widening distance between producer and consumer, and the larger "circulation of wares." But these various features have been historically interdependent. The widening of the area of economic dealings between individuals has facilitated the substitution of national for local control; and the reverse is equally true.

"National economy" (*Nationalökonomie*) is also one of the several German designations of the science of political economy.

[G. Schmoller, *Studien über die wirthschaftliche Politik Friedrichs des Grossen*, in his *Jahrbuch*, N. F. viii. (1884), pp. 17 ff.; trans. under the title *The Mercantile System and its Historical Significance* (1896).—K. Bücher, *Entstehung der Volkswirthschaft* (1893), pp. 15 ff.—Ashley, *Econ. Hist.*, pt. i. 206, pt. ii. 7, 9, 42, 43.] W. J. A.

NATIONALISATION OF LAND. See LAND, NATIONALISATION OF.

NATIONALIST (U.S.A.). The term applied to a social reform movement crystallising in the United States about 1888, favouring collectivism and management of industries by the government. It had its centre in Massachusetts, and was in a considerable measure the result of the publication of *Looking Backward* (1888) by Edward Bellamy. Societies were formed in various parts of the United States, some of which still exist.

A magazine was established entitled *The Nationalist*, of which three volumes were published; 1890, pp. 274; 1891, pp. 346; 1892, pp. 576. This movement is educational rather than political, resembling the attitude of the Fabian Society in England. Its views have also been represented in a weekly publication in Boston entitled *The New Nation*, edited by Mr. Edward Bellamy, which has now suspended publication. D. R. D.

NATIONALITY. "A portion of mankind may be said to constitute a nationality if they are united among themselves by common sympathies, which do not exist between them and any others—which make them co-operate with each other more willingly than with other people, desire to be under the same government, and desire that it should be government by themselves or a portion of themselves exclusively." With these words John Stuart MILL opens the chapter on nationality in his work on *Representative Government*. He goes on to analyse the influences which unite peoples among themselves and make them wish to form one body politic. Race, religion, language, local contiguity, and "identity of political antecedents" are all-important, though it is quite possible that one or more of them may be absent when the feeling of nationhood exists, or present when it does not exist (see NATION). When a nationality has been placed under one rule, and that the rule of some of its own members, it may conveniently be called a nation. The doctrine of nationality asserts that liberty, progress, and order are best secured when states and nationalities coincide. It maintains that all the individuals who compose a nationality should live under the same government, or in other words that nationalities ought to be nations. In one sense it is a revival of the old theory of political union through blood-relationship; but it includes the more modern notion of territorial sovereignty, since its advocates hold that the districts inhabited by men of the same race should, as far as possible, be placed under the same rule. It came into being as a protest against the doctrine of a balance of power, which divided provinces among states without regard to the wishes or political affinities of their inhabitants. It has modified immensely the state-system of modern Europe. Mazzini made it the gospel of the champions of Italian freedom. It helped to unite the German peoples into one powerful empire. The pan-Slavonic and pan-Hellenic movements owe their vitality to its inspiration, and each is a force which statesmen know they have to reckon with in the future. In its crudest form it assumes what is not true, and asks for what is not possible. Community of language does not prove community of blood. Race is not the only bond which brings men together in political union, still less is it so sacred that all arrangements made in derogation of its claims are internationally null and void. Outlying parts of a nationality are sometimes separated from the bulk of their fellows by realms inhabited by men of different blood. In some territories races are so mixed that it is difficult to say what nationality prevails. But as stated and guarded by J. S. Mill, the doctrine does but express the commonly accepted view that a people sufficiently distinct from other peoples to form a distinct nation should be ruled according to its own wishes.

NATURAL AGENTS. See AGENTS of PRODUCTION.

NATURALIZATION. Down to 1844 (7 & 8 Vict. c. 66), the only way of passing from the condition of alien to that of natural-born subject was by act of parliament which, if private, naturalized certain people; if public, naturalized classes of people. In 1844 naturalization by certificate of the home secretary was introduced and has superseded the older method. The act of 1844 is replaced by that of 1870, 33 & 34 Vict. c. 14, under which any alien who has lived five years in the United Kingdom, or has served the crown for that period and wishes to continue doing so, may apply to the home office; he must prove the facts on which he relies by "statutory declaration," and must pay £5 : 5s. in fees, and must swear to be faithful to the British Sovereign. The Home Secretary may, at his discretion, refuse the certificate. From 1609 to 1825 an oath declaring the king supreme head of the church, and the taking of the sacrament according to the ritual of the established church was as a rule exacted, but in the American colonies and Ireland, Protestant dissenters need not observe the latter form; the first condition was abrogated by the acts of 1844 and 1870, and the second by the act of 1825. Colonies are authorized by acts of 1847 and 1870 to make their own naturalization laws.

(1) A peculiar interest attaches itself to the objects with which acts naturalizing classes of people were passed. A. Smith, after mentioning 5 Geo. I. c. 27, and 23 Geo. II. c. 13, under which the exportation of "living instruments of trade" —in other words the emigration of artificers—was forbidden, writes: "I do not observe at least in our statute book any encouragement given to the importation of the instruments of trade" (bk. iv. ch. viii. ed. 1890, pp. 502, 516). We can here supply A. Smith's omission. The English act of 1663 (15 Car. II. c. 15), after reciting that "vast quantities of linen, cloth, and other manufactures of hemp and flax, and of tapistry hangings are daily imported into this kingdom from foreign parts to the great detriment and impoverishment thereof, the monies and quick stock of this kingdom being thereby daily greatly exhausted and diminished," naturalized Protestant manufacturers of these articles if they would reside in England three years. Even the Irish plantation acts expressed the same economic object when they offered citizenship to any one who would condemn papal doctrine and acknowledge the royal supremacy; thus the Irish act of 1662 (14 & 15 Car. II. c. 13), begins: "Whereas much coin and ready money is carried out and transported for buying and purchasing of foreign manufactures, to the great exhausting and diminishing the treasure of this kingdom." Similarly the acts of 1732 (5 Geo. II. c. 28), etc., which naturalized foreign Protestants who served in the Greenland fisheries, etc., were passed in order that England might import commodities such as blubber without exporting money. The Fishery and Irish Acts were animated far more by political than by economic motives, but the MERCANTILE SYSTEM and the theory of the BALANCE OF TRADE are one root of those acts, and the taproot of the act of 1663. These acts were repealed by the Statute Law Revision Act 1863 and by the act of 1870, but had died a natural death at least half a century before. Other naturalizing acts were passed from time to time to carry out the pre-Malthusian idea that numbers meant wealth as well as strength (7 Anne, cap. 5, xiii.; George II. cap. 7 (preambles), and see *Reflections upon Naturalization, etc., by a Country Gentleman*, 1753. (2) Secondly as to the effects of naturalization, Francis Bacon wrote: "There be but two conditions native and alien—nam tertium penitus ignoratur." The first hint of an intermediate class is in the act of 1663, which taxed aliens naturalized under that act still as aliens, when they traded with foreign parts. The first political barrier between naturalized alien and natural born was raised by an Irish act of 1703, amending that of 1662, which deprived aliens naturalized under the principal act of the vote and of power to be magistrates, officers of a city, or members of parliament. In England, under the Act of Settlement and other acts, naturalized aliens (*a*) could not after 1714 be members of parliament nor of the privy council; (*b*) nor fill any office of trust; (*c*) nor receive grants of crown lands. The first disability (*a*) continued until 1870; (*b*) and (*c*) until 1844. A naturalized alien may still find himself at disadvantage if he visits his old country or a colony.

[Pollock and Maitland, *History of English Law* (1595), bk. ii. ch. ii. § 6 (mediæval).—G. Hansard, *Treatise on the Laws relating to Aliens* (1844) (modern English).—Henry Wheaton, *Elements of International Law*, ed. A. C. Boyd, 3rd edition (1889), § 82a (see ALIENS; DENIZEN).] J. D. R.

NATURALIZATION IN THE UNITED STATES. The constitution of the United States (art. 1, § 8) gives congress power to "establish an uniform Rule of Naturalization." The law of 26th March 1790 permitted naturalization after two years' residence, upon application to any common-law court of record and the taking of an oath of allegiance. In 1795 the law was revised so as to provide for a preliminary declaration of intention to become a citizen, to be made three years before admission to citizenship, and requiring a total residence of five years. Owing to the hostile feeling against the French, which became so violent toward the close of Washington's administration and during that of John Adams, an exceedingly stringent law was passed in 1798, providing that the declaration of intention to become a citizen must be made five years before admission to citizenship, and that the applicant must prove a residence of fourteen years in the United States, five in some one special state, before admission. This law was an outcome of the same feeling that led to the passage of the alien and sedition laws, which from their unwise severity were the chief influence in bringing about the downfall of the Federal party. Less than four years later, in 1802, the law was amended providing that the declaration of intention must be made three years before admission, and that the total period of residence should be five years. The law required, in addition to the usual oath of allegiance, also an abjuration of allegiance to any foreign ruler.

Though there have been since that time some slight changes, the law remains substantially the same, with the exception that the declaration need be made only two years before final admission as a citizen. Several provisions have been made regarding special classes of citizens. For example, during the time of the civil war it was provided, in 1862, that any honourably discharged alien soldier might be admitted to citizenship without previous declaration, upon proving one year's residence. Children of persons naturalized become citizens if under twenty-one years old at the time of parents' naturalization. Any alien under twenty-one who has resided in the United States three years before arriving at that age, may be admitted after five years' total residence without previous declaration of intention.

The right of naturalization in the United States carries with it all the rights of native citizens, with the exceptions that the President and Vice-president of the United States must be native born; and that the naturalized

citizen cannot serve as a United States senator until he has been a citizen of the United States nine years, or as a member of the House of Representatives until he has been a citizen seven years. The power to vote for the President and members of Congress in the United States depends upon the right given by the individual states to vote for members of the lower house of their legislatures, and no fewer than sixteen states grant this right to vote before the alien becomes naturalized. In one case, Indiana, if the alien has declared his intention of becoming a citizen and has resided one year in the United States and only six months within the state, he may vote. Minnesota requires only one year's residence and declaration of intention. In all these sixteen states an alien must have declared his intention of becoming a citizen; the period of residence varies from six months to four years. Twenty-eight states require that a man become a full citizen before he is permitted to vote. There can be no doubt, however, that even in some of the states where naturalization is insisted upon as a pre-requisite to voting, many frauds have been committed by political leaders for the sake of securing the too early naturalization of aliens in order that their votes may be obtained.

Many questions arose some years ago between the United States and several of the European states regarding the protection that should be extended by the United States to naturalized citizens abroad, especially in the state from which the naturalized citizen had emigrated. Several of the European countries, particularly Germany and Austria, insisted upon holding for military duty those persons who, before serving their regular period in the army, had emigrated to the United States. The United States, on the other hand, if the emigrants had become naturalized citizens, insisted upon protecting them against the government of their native country. In 1868 congress passed an act providing that "all naturalized citizens while in foreign states shall be entitled to and shall receive from this government the same protection in person and property as is accorded to native-born citizens in like situation and circumstances," a practical repudiation of foreign claims. Within the next three years treaties were negotiated with the leading countries concerned—England, Austria, Baden, Bavaria, Belgium, and others, which removed all such causes of controversy. States that before had not recognised the right of expatriation, under these treaties recognised it, with the proviso in ordinary circumstances that, if the person concerned had left unperformed, at the time of his emigration, any obligation then due to his native state, he might be held to the performance of that obligation, but of no other; or if he had committed any crime against that country he should be held for punishment. In one instance, the evasion of military duty was specifically mentioned. In certain cases, notably in that of Martin Koszta, the United States has extended a certain amount of protection in foreign lands to aliens who, not yet fully naturalized, had when resident there formally declared their intention of becoming citizens of the United States; but obviously this protection could not be carried far against the person's native state.

The necessity imposed upon the United States of protecting its naturalized citizens has been greatly increased by the great immigration into that country; and its readiness in granting such protection has doubtless had much influence in liberalising the views of other countries regarding the right of expatriation. J. W. J.

NAVARRETE, PEDRO FERNANDEZ (end of 16th and early 17th century), was chaplain to the royal family of Spain, and an officer (*consultor*) of the Inquisition. The miserable state of Spain had led the supreme council of Castile to submit to King Philip III. a Great Report (*Gran Consulta*) on the remedies to be applied; this report was delivered on February 1619, and gave rise to fifty *Discursos* or glosses from Navarrete, printed in 1626 at the royal press, and several times reprinted since under the title of *Conservacion de Monarquias*. They are included in Rivadeneyra's *Bibliot. de Aut. Españoles* (vol. xxv., Madrid, 1853).

Though a long-winded writer and rather too fond of learned quotations, Navarrete shows himself in many respects free from contemporary national and religious prejudice. Speaking of the expelled Moors, he says, "I am certain that if before driving them to desperation, it had been sought to admit them to some honourable offices without any note of infamy, it is possible that they might have been willing to be received in the Holy Church through the gate of honour" (*Discurso* VII.). In the same discourse, he wonders whether all the Irish refugees were bred to be noblemen as they show such reluctance to labour. He ascribes the depopulation of Spain to the numerous continental wars, and the passion for adventures excited by the discovery of America (*Disc.* VIII.) as well as by the ingrained indolence of crowds of vagrants "who are seen playing at cards the whole day in the streets of Madrid, awaiting by day the hour to be fed at the gates of convents, and by night to commit burglaries" (*Disc.* IX.). For a remedy he recommends the development of manufactures as in France, Italy, and the Netherlands, "which are rich countries, *though they reap neither gold nor silver*," and, "because human labour adds additional value to the primary value of natural produce" (*Disc.* XVI.). It would be useful to admit foreign artisans, provided they were not allowed to carry away all

their acquired wealth (*Disc.* XVII.). There are too many *mayorazgos* (entailed estates) (*Disc.* XI.), too many noblemen (*Disc.* XXI.), too many holidays; in some bishoprics, they cover one-third of the year, without including bull-fights and public rejoicings (*Disc.* XIII.). He sees no possibility of levying new taxes (*Disc.* XIX.), and considers that as regards sumptuary regulations "example (of the magnates) is better than imperative laws" (*Disc.* XXVIII.). In his fiftieth and last discourse, he concludes with a truth not much appreciated in the Spain of his days, namely that "the councillors of kings ought not to be like cooks, who only think of dishes to please the palate, but like physicians, who prescribe bitter and stringent pills and potions." E. Ca.

NAVARRUS DE AZPILCUETA, MARTINUS (d. 1586), one of the most distinguished Roman Catholic theologians and canonists of the 16th century, was a Spaniard by birth, and, after a long career as professor at Tolosa, Salamanca, and Coimbra, resided in Rome for six-and-twenty years until his death. To the economist he is of interest on account of his extremely liberal teaching in the matter of usury (see CANON LAW; INTEREST AND USURY). He not only justified the triple contract (see ECK, JOHANN, who also explained the principle on which, through the *Contractus Trinus*, the payment of a certain percentage for the use of money was held to be lawful), but was the first considerable theologian on the Roman Catholic side, as MELANCHTHON (*q.v.*) was the first on the Protestant side, to maintain that MORA or delay needed not to be proved to justify the payment of compensation for "interest."

[For an account of him and of his *Manuale Confessariorum*, see W. Endemann, *Studien in der romanisch - kanonistischen Wirthschafts - und Rechtslehre* (1874), i. 47, *et frequenter*, and, in English, Ashley, *Econ. Hist.*, i. pt. ii. 453.]

W. J. A.

NAVEAU, JEAN BAPTISTE (1716-1762), was a French official.

He wrote the *Financier Citoyen*, Paris, 2 vols. 1757. Although criticised by Voltaire in *l'Homme aux Quarante Ecus*, Naveau's book is still useful to consult on account of its copious information (Stourm, *Dict. Hist. des Finances*, 1895, p. 97).

E. Ca.

NAVIGATION ACTS. See NAVIGATION LAWS.

NAVIGATION CLAUSE. This is the clause found in many commercial treaties, whereby the privileges granted to the merchandise of the contracting powers are limited to goods carried by the ships of the powers or other privileged ships, or by certain fixed routes. This must be distinguished from the grant of reciprocal treatment to the ships of each power in the ports of the other. C. A. H.

NAVIGATION LAWS

I. History, p. 8; Chief provisions, p. 9. II. Policy, p. 10: (*a*) Naval Aspect, p. 10; (*b*) Commercial Aspect, p. 11.

Navigation Laws was the short title of a series of enactments designed to restrict the carrying trade of Great Britain to ships and sailors of native birth.

I. HISTORY

So far as we can ascertain, the idea of so restricting trade did not occur to the ancients, and Macpherson is correct in stating that the first instance of a navigation act was that of James, king of Aragon and count of Barcelona in 1227. This act prohibited all foreign vessels from loading goods at Barcelona for Alexandria and other parts unless no vessels belonging to Barcelona were ready and competent to perform the voyage. The object was to crush the trade of the Catalans to the Levant.

The first navigation act of the English parliament was 5 Ric. II. c. 3 (1381). In order to make better provision for an efficient navy, it enacted that no subject of the king should ship any merchandise outward or homeward, except in "ships of the king's allegiance," under penalty of forfeiture of the vessel and cargo. Within a year it was found necessary to modify this stringent enactment by the proviso, evidently borrowed from the Spanish act above mentioned, that it should be lawful to ship in foreign vessels if English could not be found.

A Scottish act followed this; it is not on record, but it was temporarily suspended for a year by an act of 1428, which allows Scottish merchants for that one year to ship in foreign vessels where Scottish are not available. At this period Scotland usually followed England closely in such a policy.

The policy which dictated these acts was a product of an age which assumed that everything could be effected by a king's decree, and viewed any progress on the part of another nation as a danger to England (cp. COMMERCE; EXPORTS, DUTIES ON). But occasional references show that the act was not entirely successful, and the attempts made from time to time to strengthen it point in the same direction. In 1485, a law was enacted for one year, that no one should buy or sell French wines unless imported in vessels belonging to England, Ireland, or Wales, and navigated principally by natives of England, Wales, Ireland, or Calais (this last is an interesting "footnote to history"). And in 1489, avowedly on account of the decadence of the English marine, a new act was passed to prohibit the charter of foreign vessels, except where there was no room for freight on English vessels. This last act seems to have fallen into disuse and was re-enacted in 1541.

A notable reversal of the policy took place in the first year of Elizabeth's reign (1558).

Since the making of the statutes," the preamble ran, "other sovereign princes, finding themselves aggrieved by the said acts, as thinking that the same were made to the hurt and prejudice of their country and navy, have made like penal laws . . . by reason whereof there hath not only grown great displeasure between the foreign princes and the kings of this realm, but also the merchants have been sore aggrieved and endamaged"; the growth of illicit traffic was also cited, and the law abolished prohibitions and made the ports of England open to foreign shipping on payment of a higher duty on goods so imported. Various breaches in this policy, even during Elizabeth's reign, were made from time to time to suit certain ideas, such as discouraging the export of corn, or to please special interests such as the TURKEY COMPANY (*q.v.*).

In 1646, the old idea re-asserted itself; the Long Parliament enacted that no duty should be levied on goods intended for the plantations, provided they were shipped in English bottoms. In this act, Macpherson finds the foundation of the navigation acts, which he hails as the "commercial palladium of Great Britain" (vol. ii. p. 431). Five years later, parliament determined that no merchandise, either of Asia, Africa, or America, including our own plantations, should be imported into England in any but English-built ships, belonging to English subjects, navigated by English commanders with three-fourths of the crew English. This is the first Navigation Act usually so styled. It was aimed against the Dutch, who were then on a free-trade basis, not only doing the carrying trade of Europe, but attracting English sailors into their service.

Chief Provisions of Acts.

As, however, this law was an enactment of the Commonwealth, it is the act of 1660 (11 Car. II. c. 18) which is usually called the Navigation Act, the *Charta Maritima* of Great Britain according to Sir Josiah Child. Its chief provisions were:

(1) The prohibition of importation or exportation into or from the plantations, except in national ships with English commanders and with at least three-fourths of the crew Englishmen.

(2) The prohibition of foreigners from becoming merchants or factors in the plantations.

(3) The prohibition of the importation of goods, the growth or produce of the plantations into England "but in such ships as doe truly belong to English people" and navigated as above.

(4) Restriction of the coasting trade to English owners only.

(5) The chief products of the English colonies to be shipped only to England, Ireland, or other plantations.

There were other restrictions and conditions which do not need mention here. The Scottish parliament followed suit in 1661, but wisely, amongst other exemptions, made the act inapplicable to the case of corn in time of dearth. In 1663 (14 Car. II. c. 11) an important extension of the act became law, excluding from the privileges of English ships all foreign-built ships, even if owned in England and manned as required by the act of 1660. This act also encouraged armament in Mediterranean vessels, chiefly because of the Barbary pirates.

For nearly two centuries the principle of these acts dominated the policy of England towards its shipping interests; it was interwoven in all acts whose chief object was the general restriction of trade to English channels, as in that of 1663, which required all commodities shipped from the plantations to pass through England to their destination. In 1675 it was found necessary to issue a proclamation to enforce the acts; in 1696, an attempt to re-enact them was made. All this shows that there was a good deal of evasion. On the other hand a sense of the weakness of the policy was shown in the partial relaxation of the acts in 1665 and 1693, in order to help English merchants to recover some share in the Greenland whale fishery. But public opinion was, on the whole, strongly in favour of the acts; hardly a voice except Richardson's (in 1750) was raised against their policy during the whole of the 18th century. The first organised attack upon them came from the colonies, and particularly the West Indian colonies, after the severance of the United States.

When the American colonies declared their independence, it seems to have been foreseen that their large trade with Great Britain, which had been fostered by artificial restrictions, would at once be lost if it were put on the footing of other foreign trade; accordingly American ships were, for the purposes of the direct trade, put on the footing of British ships. This amounted to a suspension of the navigation acts as regards this trade; and though at the time it attracted little attention, it was afterwards severely criticised as such. The order in council of 2nd July 1783, which conceded this favour, confined trade with the West Indian colonies to British ships, endeavouring to force it out of its natural channel, viz. with the republic of the United States to Canada and Nova Scotia. The West Indian colonies were not long in appealing against a restriction which, amongst other evils, made their supplies dearer and more precarious. On the 19th Nov. 1783, the legislature of Jamaica protested, and Barbados

and Antigua followed suit. The matter was referred to the Trade and Plantations' Committee in 1784, and again in 1791. They gathered information and evidence, and issued rather indeterminate reports, the gist of which was, in fact, that more harm was being done to America than to Great Britain. The matter dragged on from year to year, partly postponed by the frequent state of war, during which the navigation acts were continually suspended, as in 1803 and 1806. Very strenuous attacks were made by the shipowners upon these suspending acts, but no serious inroad was made on the principle of the navigation acts till Mr. Huskisson took the question up in 1821. He argued it very clearly and successfully. By an act of 1822 (3 Geo. IV. c. 44), the colonies were for the first time allowed to export their produce to any port, provided it were carried by British ships, and even in ships of the port for which it was destined, if that port was in one of the United States. By the same act a still more important step in advance was made; the old prohibition against the shipping of goods from the ports of certain European countries—notably the Netherlands and Germany—was at last abolished. In 1825 Mr. Huskisson carried a further reform, closely connected with his policy of reciprocal trade arrangements with other European countries; it was made legal to import the produce of any country in a ship of that country as well as in a British ship; the privilege which had been granted first to the United States, and then to Portugal, was made general, though with some sort of stipulation for reciprocal treatment.

The act of 1825 (6 Geo. IV. c. 109) practically brought the navigation act to that final form in which it was the subject of so much debate after the free-trade movement was established. The act was consolidated and re-enacted in 1833, and again in 1845 (8 & 9 Vict. c. 88). The latter was the last navigation act: it restricted the importation of certain enumerated articles to British ships or ships of the country in which these articles were produced; it prohibited the importation of the produce of Asia, Africa, and America, from any European port in any ship; it confined the trade between all parts of the British empire to British ships; and it required that a British ship should be navigated by a British master and a crew three-fourths of whom were British. The act should be read with those relating to the registration of ships and of seamen.

But every year the restraint became more irksome. The colonies and foreign countries were alike protesting, and volumes of bluebooks were filled with memorials. In 1847 the House of Commons appointed a select committee to consider the subject: five times they simply reported the evidence which they had taken; the conflict of testimony was so great that they seemed unable to proceed to a report. In 1848 the House of Lords did exactly the same. But in 1849 the movement in favour of repeal could no longer be withstood: by the act 12 & 13 Vict. c. 9, the old navigation acts and their policy were swept off the statute book as from the 1st of January 1850.

II. Policy.

The beneficial results claimed for the navigation acts by their defenders were two, viz.:

a. That they secured England's naval supremacy by forcing her people to become sailors.

b. That they laid the foundation of England's commercial greatness.

Even Adam Smith, pointing out that they probably had their origin in national animosities, wrote of them—"They are as wise as if they had been dictated by the most deliberate wisdom."

(*a*) *Naval Aspect.*

In making that statement Adam Smith was evidently thinking chiefly of the naval aspect of the question. The opinion that these acts had been the origin of England's naval strength, prevailed to modern times, and was much in evidence before the parliamentary committees of 1848 and 1849. Even at the present day, many would be found to support it. But the better opinion would seem to be that which contests this view. Mr. Labouchere, speaking in the House of Commons in 1848, referred to the above-cited statement of Adam Smith's, as "one of the few errors which Adam Smith ever made." We might expect such authorities as Macgregor and Porter in evidence before H. of C. committee, to be against the contention—but many would pay greater attention to Captain Sir John Stirling's view that the navy had derived no benefits from the acts. It is difficult to produce actual evidence for or against the view in question. A few general considerations certainly shake confidence in it. To go no further back, in Elizabeth's reign, when there was little restraint on shipping, the navy of England proved itself vigorous and efficient, both in the Channel and off the Spanish main. The Dutch, despite the acts, were powerful at sea long after 1650. Soon after the enactment of the Navigation Act, the navy was at the lowest ebb in its history, and Coke, writing in 1671, thinks the act had actually weakened it. And allowing that there is another side to the argument, we may nevertheless cite the facts (1) that in 1740, and again in 1803, one of the most vital provisions of the act, as to the proportion of British seamen, was suspended during war time; and (2) that foreign seamen

were for years employed surreptitiously in the coasting trade of Great Britain in spite of the law to the contrary.

Since the repeal of the acts, there has been no apparent decrease in England's naval strength. Further, the best school for the navy is in the mercantile marine, and that which cramps the development of the latter must injuriously affect the navy. So that Adam Smith himself, when, passing from the passage already quoted, he states that the navigation acts were bad for commerce, appears to furnish a refutation of his own previous statement.

(*b*) *Commercial Aspect.*

This second passage from Adam Smith is as follows: "The navigation act is not favourable to foreign commerce, or to the growth of that opulence which can arise from it." If we could accept as representative the opinion of an ardent supporter of the act, the advocates of the act had no care that it should be favourable to commerce. "Trade," he writes, "was considered principally as the means for promoting the employment of ships, and was encouraged chiefly as it conduced to the one great national object, the naval strength of the country" (*v. Collection of Papers*, 1807, noted at end of article). Not that the loud complaints of the shipping interest, towards the end of last century and onwards, show so much anxiety for the naval strength of the country as for their own private advancement. They would not, in fact, have agreed with Adam Smith. They alleged that the suspension of the acts was followed by decrease in shipping, and that they were at once handicapped in their competition with foreign shipowners. Some attempt was made to prove this by figures, but we have found it impossible to handle those figures as a simple indication of the separate effect of the navigation laws or their suspension. We can here only give some general statements.

Macpherson triumphantly quotes the Dutch remonstrance against the acts at Breda (1667) as an evidence of their value in wresting the trade from the Dutch; but we find nothing to show upon what lines the remonstrance proceeded, and it is at least as likely that it was directed against the general unfriendliness of the policy and the stringent powers of search given to British officers. It was to the gradual decline of the carrying trade of the Dutch that most of the advocates of the acts have pointed as evidence of their success; but they fail to consider the other reasons which led to the transfer of the sovereignty of the ocean. Thorold Rogers (*Econ. Inter. of History*), free trader as he was, states that the navigation acts of Cromwell transferred the supremacy of the seas from Holland to England.

On the other hand, Macpherson admits that there were very soon loud complaints of the acts from British subjects. Roger Coke (*q.v.*) (1671) states that within two years the act had lost England the Baltic and Greenland trade; and two or three times it was specially waived with a view to the recovery of that trade. Sir Josiah Child, the great advocate of the acts, gives much evidence of their impotence and interference with trade. Richardson (1750) found great fault with the working of the acts. A glaring instance of their unfairness is that quoted by the assembly of Jamaica, that in 1783, when there was great distress in the island, there were about 5000 barrels of flour in the harbour which could not be landed because of the provisions of the navigation act. Labouchere cites as a gross instance of their bad effect, a despatch from the government of Trinidad to Earl Grey. "When coolie labour was first proposed to be introduced, American vessels could have been procured to bring them at £9 per head whereas the present charge is nearly £18." More general instances may be found in the evidence before the select committees of 1847 and 1848. And the short allusion to them in the first report of the Commissioners of Customs is a severe condemnation.

That their relaxation did not injure British shipping may be shown from Mr. Huskisson's figures comparing British and Foreign ships entering English ports.

	British tonnage.	Foreign tonnage.
Average of 1814-1823	1,607,948	539,062
,, ,, 1824-1826	1,963,678	804,366
Actual number in 1826	1,950,630	694,116

The increase of British tonnage was greater in proportion than that of foreign tonnage. The year 1826 was one of depression.

That the abolition of the acts did not injure British shipping, is shown by the following returns.

	British ships trading to and from English ports.		Foreign ships trading to and from English ports.	
	No.	Tonnage.	No.	Tonnage.
1845	.....	8,546,090	.....	3,531,215
1850	44,698	9,442,544	32,045	5,062,520
1855	45,852	10,919,732	37,695	7,569,738
1860	52,643	13,914,923	50,503	10,774,369
1865	63,170	19,358,955	48,897	9,538,137
1870	70,587	25,072,180	49,116	11,568,002

The proportion of British tonnage in 1845 was 71 per cent; in 1865 it was about 67 per cent; in 1870 barely 70 per cent. Coming to 1880 there were 41,348,984 tons of British

against 17,387,079 foreign, or rather over 70 per cent, and at the present day the proportion remains much the same. As against these figures the only argument to be used is that the numerical increase of British tonnage would have been greater had the acts been maintained. This is contrary to the balance of evidence.

NAVILLE, FRANÇOIS MARC LOUIS (1784-1846), was born at Geneva and died at Vernier near that city. He was a Protestant pastor of French extraction; persecution having driven his family from their native land. Like many pastors he occupied himself with education.

In 1829 the French Academy offered a prize on the subject of Charity—two competitors were bracketed equal for it—DUCHATEL and Naville.

Naville's paper, revised and enlarged, was printed under the title *De la charité légale, de ses effets, de ses causes et spécialement des maisons de travail et de la proscription de la mendicité* in 1836, 2 vols. 8vo. The success of this work is due to its methodical arrangement and the clearness of its conclusions. It argues against charity dispensed by the state, in favour of private bounty. The sincerity of the author is shown in his declaration that when commencing to write he was quite of the opposite opinion, and regarded charity as one of the normal and necessary functions of the state. In working on his subject he felt the instability of the basis of his opinions, and argued against state interference. Within the limits of the subject the work is a masterpiece. A. C. F.

NEALE, EDWARD VANSITTART (1810-1892), Vansittart Neale's active connection with co-operation did not begin till he was forty years of age, though he was ripe for the work by a previous searching study of systems of socialism.

About 1850 he heard of and joined the well-known band of Christian Socialists (see CHRISTIAN SOCIALISM), and became a member of the "Society for Promoting Working Men's Associations" of which the Rev. F. D. MAURICE was then president.

His work for the co-operative cause during forty years was rather of a practical than of a literary character. Yet his literary work was considerable, and included a *Manual for Co-operators* and many magazine articles on social economics, the last, *Thoughts on Social Problems and their Solution*, appearing in the *Economic Review*, October 1892, after his death. He was also a constant contributor to the *Co-operative News*, and numerous pamphlets issued by the Co-operative Union were written by him. His practical work may be classified as follows:

1. *Promotion of Co-operative Societies.* He started the first co-operative stores in London, and the "Central Co-operative Agency," which anticipated, if it did not actually bring about, the present Co-operative Wholesale Society. He took an active part in the formation and management of many societies, distributive and productive, and helped them largely with funds. Amongst other attempts he, with his own capital, tried a large experiment in co-operative production at the Atlas Engineering Works. Though he thus lost a considerable fortune, the sacrifices made by Neale in the cause did perhaps more than anything to keep out class jealousy and distrust from the co-operative movement.

2. *Legal Work*, and especially the promotion of legislation to protect industrial societies. It was chiefly through the efforts of Neale and J. M. Ludlow that the first Industrial and Provident Societies Act was passed in 1852, which gave a legal status to co-operative societies —regarded hopefully by some as the "Magna Charta" of the labouring classes. He shared in the drafting of many amending acts, and was solely responsible for the great consolidating act of 1876. He also gave valuable assistance in framing rules for co-operative societies, notably those of the Co-operative Wholesale Society and the Co-operative Union, and he prepared the model rules under which most societies are now governed.

3. *Work in connection with the Co-operative Union.* With the rapid growth of the Co-operative Wholesale Society's business, it was felt that something other than a successful business concern was required as the "official and recognised representative organ of co-operation in England."

Congresses presided over by Vansittart Neale were accordingly held in London in 1868. They were the forerunners of the co-operative congresses, which are now of annual occurrence, and led to the formation of the Co-operative Union. In all this Neale took a very prominent part, and in 1874 he became secretary of the Union, living in lodgings in Manchester and devoting himself absolutely to the work. He retained this post until within a few months of his death, notwithstanding his advanced age, and his succession to a landed estate, which

would have drawn away most men from such arduous work.

In this position he was at the centre of the co-operative movement in England; he also attended congresses and corresponded with co-operators abroad. He helped to found, in 1884, the Labour Association for advancement of co-operative production and labour partnerships —which still exists.

It is perhaps needless to add that in the great question that threatens a division among co-operators, Neale held that the workpeople employed by co-operative distributive societies, wholesale or retail, were entitled to a share in the profits, and a voice in the direction, instead of being treated like the employés in any ordinary factory or workshop.

E. V. Neale wrote several religious works; among those on co-operative questions are:—*Association and Education: What they may do for the People.*—*Land, Labour, and Machinery.*—*The Economic Aspect of Co-operation.*—*The Three C.'s Co-operative Triologue.*—*May I do what I will with mine own?* 1851.—*The Economics of Co-operation.*

[Henry Pitman, Life, Co-operative Union, Manchester, 1894.—Notice by J. M. Ludlow, *Economic Journal*, vol. ii. 1892; and notices by Judge Hughes, *Economic Review*, 1893 (see also CHRISTIAN SOCIALISM; CO-OPERATION).]

H. HO.

NEBENIUS, KARL FRIEDRICH (1784-1857), was born near Landau in the Rhenish Palatinate. After studying law at Tübingen, he made himself acquainted with the Napoleonic methods of administration as a volunteer assistant to the prefect at Besançon, but would not accept a place in the French service. He became in 1807 private secretary in the Baden ministry of finance, in 1823 first councillor, and in 1838 president of the ministry of the interior. He supported a liberal policy, but the absolutist party under Blittersdorf gained the ascendancy, and he resigned office in 1839. He declined an offer from Frederick William IV. of a high position in the Prussian service. On the fall of Blittersdorf he became again in 1845 minister president. He retired in July 1849; suffered for some years from failing sight, and died at Karlsruhe.

Nebenius was the leader of reform in Baden for nearly forty years, constructing the new constitution of the state in 1818, creating its railways, remodelling its taxation and domain-management, introducing the metrical system of weights and measures, organising the system of popular instruction, and regenerating the higher teaching, especially in the university of Heidelberg, of which he was curator. But his name is chiefly associated with his energetic and successful efforts for the establishment of the ZOLLVEREIN—an event which Roscher pronounced to have been the most important in German history between Waterloo and Königgratz. List had done much, as a popular writer and indefatigable agitator, to recommend to the national mind the idea of such an institution; but Nebenius studied its conditions, conciliated its opponents, and devised a tariff for the general adoption of its component states, so that he has been justly called its intellectual founder. The perseverance, foresight, and tact with which he worked out the problem, merit hearty approbation.

As a scientific economist he was of the school of Adam Smith, and was an advocate of free trade as the general rule in practice; but he rejected the doctrine of the absolute non-intervention of the state in the industrial world. His principal theoretical work was *Der öffentliche Kredit*, 1820, 2nd ed., 1829, "perhaps," says Roscher, "the best monograph in the whole economic literature of Germany, and certainly the most important treatise on the subject of public debts which has been written in any language." His most noteworthy writings bearing on the question of the Zollverein were his *Denkschrift über das Deutsche Zollwesen*, written and privately circulated in 1819, but not published till 1833, and *Der Deutsche Zollverein, sein System und seine Zukunft*, 1835.

NECESSARII HEREDES. Members of the household of a deceased person, upon whom his inheritance fell, succeeded to him as universal successors or heirs without any consent of their own, and whether they wished to succeed or not. Hence they are called in Roman law necessary heirs—*necessarii heredes*, being opposed to heirs, who are not members of the household of the deceased, as these do not acquire his inheritance without an act of acceptance on their part, *hereditatis aditio*.

There are two classes of *necessarii heredes*: 1. *sui et necessarii*, descendants of the deceased under his paternal power, who become by his death independent persons, *sui juris*; 2. *necessarii heredes*, *i.e.* slaves of the deceased made heirs by him in his will. E. A. W.

NECKER, JACQUES (1732-1804), was born and died at Geneva. His character was an unusual mixture of qualities rarely united in one individual. A very able and honest banker, he established a house of the highest standing at Paris—Thélusson, Necker & Co.,—and rapidly accumulated a large fortune; satisfied with the wealth he had acquired, he retired from business at the age of forty to devote himself to politics and literature. He believed himself possessed of sufficient capacity to lead the political world, and that at a moment when it was in the utmost disorder. Dexterous in the use of expedients, and but slightly burdened with theory, he flattered himself that he would eclipse Turgot, whose inferior he was, especially in grasp of principle. His first work, the *Éloge de Colbert*, received a prize from the French Academy in 1773, he then wrote *De la législation et du commerce des grains*, 8vo, 1775, which, dogmatic in style and opposed to the views of

Turgot, had considerable success, and even contributed to the fall of that minister (19th May 1776). On Turgot's successor, de Clugny, dying, 30th October 1776, Taboureau des Reaux was appointed to succeed him, and compelled to accept Necker as his coadjutor. This led to his resignation 1st July 1777, when his duties were handed over to Necker under the title of *Directeur-général des finances*. Though acting as *Contrôleur-général*, he was not granted that title, as this would have admitted him to the council of state, and he was a protestant. In this, his first essay in finance, Necker showed marked ability, diminishing the expenses, simplifying the machinery of the administration, and, through his connection with the great Bank, obtaining exceptionally favourable terms for the treasury. The tide of public opinion began now to set in the direction of the convocation of the *États Généraux*. In 1781 Necker's famous *Compte Rendu au Roi* appeared, addressed rather to the public than to the head of the state. His popularity increased; the success of his report, the first of its class, though incomplete, was great. The condition of the finances of the country was improved, but an unexpected result occurred. Cabals were roused against him, perhaps fomented by Necker's extraordinary vanity and his folly in mixing praises of his wife, whose *salon* was celebrated, with his official reports. The court became hostile, and in 1781 he was compelled to resign. But the weaknesses of the best-known of his successors, Calonne, caused the public to think with regret of the fallen minister, and the publication of *De l'administration des finances de la France*, 3 vols. 8vo, 1784, contributed to strengthen his popularity. This work, like those which Necker had written previously, is marked by an absence of general principle; it was declamatory and exaggerated in style, but valuable to those who would study how the finances of France were managed in the last days of the old régime.

Necker was detested by the court as a protestant and a bourgeois, nevertheless Louis XVI. found himself compelled to recall him to power, 20th August 1788, this time also with the title of *Directeur-général des finances*. The financial position was serious. The payment of the interest of the public debt was suspended, the treasury empty; Necker's return to power inspired confidence, and, as if by magic, money reappeared. He had, however, to employ his private resources to sustain the public credit. Though the court was still hostile, the multitude applauded him. When he spoke of retirement the court was compelled to ask him to remain in office, but by one of those sudden turns of fortune so frequent at this period, the king intimated to him his dismissal, 11th July 1789, and ordered him to leave France secretly. Necker obeyed and returned to Geneva. The effect of his departure on public opinion was terrific. In the midst of these disturbances the Bastille was taken, and on 29th July, Necker was recalled by the court with the title of *Premier ministre des finances*, and was admitted to the council. His return was an unparalleled triumph. In every town that he passed through between Switzerland and Paris the horses were taken out of his carriage and he was drawn by the admiring people. This mad enthusiasm could not last. Some slight errors in judgment alienated public opinion, and on 8th September 1790 he was again compelled to leave office and France, this time for ever. The populace was indifferent, if not hostile. In a small town in Champagne, he, who had never deigned to accept the salary attached to his high office, was arrested as a malefactor. How little he had deserved this may be understood from the fact that he had left behind him at the treasury, to assist the public credit, £96,000, his own property, which was only returned to his daughter the well-known Madame de Staël-Holstein in the early years of the Restoration. An order had to be obtained from the national assembly to enable Necker to regain his liberty and to return to Switzerland.

Of Necker's later works we need only mention: *Sur l'administration de M. Necker par lui-même*, 8vo, 1791.—His work on *La législation et le commerce* is inserted in the economic collection of Guillaumin.

[Adam Smith called Necker "a mere man of detail,"—Sir J. Mackintosh is the authority for this. Rae, *Life of Adam Smith*, 1895, p. 206.]

A. C. f.

NEGATIVE QUANTITIES occur in economics, as in other sciences, when a variable, passing through zero, becomes less than nothing, so that the addition thereof causes not augmentation but diminution. Most economic quantities are susceptible of this *change of sign*. Thus wealth, affected with the *minus* sign, becomes debt. The utility attending the consumption of wealth being taken as positive, the disutility of labour incurred by the production of wealth must be regarded as negative. Consumption is negative production. Jevons proposes to employ DISCOMMODITY to signify any substance or action which is the opposite of *commodity*, that is to say, *anything which we desire to get rid of*, like ashes or sewage (*Theory*, 2nd ed. p. 63). Such an article may be said to have negative value. Among articles which have a negative value AGENTS OF PRODUCTION may occur. The loss attending the use of old-fashioned machinery and plant may be considered as a negative "quasi-rent" (Marshall). It is conceivable that, capital becoming superabundant, borrowers would pay a "negative interest," that is, receive a payment for safeguarding and keeping up the capital borrowed (Prof. Foxwell, The Social

Aspect of Banking, *Journal of the Institute of Bankers*, vol. vii. p. 71, 1886). The practical limit to this class of payment would be soon attained. The payment which a waiter makes in order to be allowed to serve in a fashionable restaurant where there is a prospect of gratuities might be described as negative wages.

The geometrical representation of a negative quantity, by reversing the direction of a line, is common in mathematical economics. Thus Jevons (*Theory*, 2nd ed. p. 187) represents the disutility of labour by ordinates measured downwards, the utility of consumption being represented by ordinates measured upwards. Of course the pleasure which may attend initial stages of labour is to be measured in an opposite direction from fatigue. A beautiful example of this construction is given by GOSSEN.

[The philosophy of the subject is stated ably and authoritatively by Cournot in his *Revue Sommaire*, in a passage directed against Mr. H. D. Macleod's peculiar use of negative quantities in economics.]

F. Y. E.

NEGOTIABLE INSTRUMENT. The standard definition of a negotiable instrument is that given by Lord Blackburn, who says, "It may be laid down as a safe rule that where an instrument is by the custom of trade transferable, like cash, by delivery, and is also capable of being sued upon by the person holding it *pro tempore*, then it is entitled to the name of a 'negotiable instrument,' and the property in it passes to a *bona fide* transferee for value though the transfer may not have taken place in market overt." As regards the custom of trade, it is to be noted that the question must be determined by the usage of the English money market, and not by the usage of the country where the instrument was issued, if it be a foreign instrument. The definition itself appears to require two qualifications. First, an instrument, not otherwise negotiable, may be made negotiable by statute; and, secondly, foreign government bonds to bearer may undoubtedly be negotiable, yet the holder cannot sue the foreign government upon them in the courts of this country. The main classes of negotiable instruments are, bills, promissory notes, cheques, bank-notes, exchequer bills, foreign bearer bonds, bearer debentures, and scrip. Postal orders are not negotiable.

[See COMMERCIAL INSTRUMENT; NOT NEGOTIABLE; Chalmers on *Bills of Exchange*.] M. D. C.

NERI, POMPEO (1707-1777). Born in Florence, a Tuscan economist and statesman. He was a minister of Leopold I. of Tuscany. He also held office in Milan under Maria Theresa and reformed the municipal government there. He presided at the commission of the taxation of the state of Milan, and at the conferences appointed to draw up a coinage convention between the Austrian states in Italy and the states of the king of Sardinia on the Italian side of the Alps. Neri's name is especially associated with the great Leopoldine reforms in which he played an important part; he was entrusted with the compilation of the civil laws for Tuscany; he then undertook economic reforms, suggesting to his sovereign the adoption of free trade in grain, which he was the first in Italy to support, and introduced gradually by the laws of 1763-64 and the edict of 1767—the corner-stone of the edifice of economic freedom in Tuscany. He abolished the duty on foreign corn, taxes and bounties on bread, and overcame the obstacles which hindered the free circulation of cereals in the interior.

Neri's work is of importance from a scientific point of view. In his *Discorso sulla materia frumentaria* he shows that absolute freedom for the corn trade is the only system suitable to Tuscany, and is the fundamental basis of its economic laws, whether agriculture or the general requirements of food production be considered. This treatise formed the basis of those Tuscan reforms on which an illustrious group of economists collaborated. Another important work of Neri's is on the value of money, in which, though he may not state much that is new, he expounds with brevity and clearness the principles regulating the choice of the material for the coins, and defines the regulations according to which money should be minted. He also wrote in 1750 a voluminous report on the basis of the Milanese taxation, a great work of proportionate assessment initiated by Charles VI. in 1718, and carried on by Neri. This report was continued by G. R. Carli in 1776. *Osservazioni sul prezzo legale delle monete*, Milan, 1751.—*Discorso sopra la materia frumentaria*, 1767.—*Relazione dello stato in cui si trova l'opera del censimento universale del ducato di Milano*, 1750.—See, concerning Pompeo Neri, J. Montgomery Stuart, "The History of Free Trade in Tuscany," in the *Cobden Club Essays*.—V. Cusumano, *La teoria del commercio dei grani in Italia*, Bologna, 1877 (Archivio Giuridico).—A. Morena, *Le riforme e le dottrine economiche in Toscana*, Florence, 1886-87 (in the Rassegna Nazionale).

U. R.

NEUMANN SPALLART, FRANZ XAVIER (1837-88). Ritter von Neumann Spallart was an Austrian economist and statistician of high ability whose comparatively early death at about fifty years of age was regretted by friends and colleagues not only in Austria but in all the leading countries of Europe. He was educated at the university of Vienna, where he studied law and economics, and took his degree as doctor of laws in 1862. After travelling for a time in Europe, he returned to Vienna. In 1864 he became professor of political economy at the Vienna commercial academy, and subsequently was appointed to other important educational positions. In 1871 he became an honorary member of the Imperial-Royal Statistical Central Commission, to which body he gave valuable services up to the time of his death. In 1876 he represented the

commission at the International Statistical Congress at Buda-Pesth, at Paris in 1878, in Paris again in 1885, and in London with Professor von Inama Sternegg in the same year, when the jubilee of the Royal Statistical Society took place. This meeting in London was remarkable for the foundation of the International Statistical Institute, the regulations of which Neumann Spallart drafted chiefly in concert with Dr. L. Bodio, though others had a share in that important work. The institute, at its first meeting in Rome in 1887, elected Neumann Spallart as its second vice-president; and though far from well at the time, he did much useful work on that occasion. In the winter of 1887-88, the chest complaint from which he had always suffered more or less grew rapidly worse and he died in April 1888.

Neumann Spallart was the author of a great many volumes and pamphlets, many of them having special relation to Austria-Hungary, as might be expected. A list of his works will be found in the *Journal of the Statistical Society* for June 1888. His most widely-known contribution to statistics is his admirable *Uebersichten der Weltwirthschaft* published at Stuttgart in various years from 1870 to 1883-84. W. H.

NEUTRAL MARKETS. It is one of the main objects of neutral states to keep their markets open for trade in time of war. On the other hand belligerent powers, in their anxiety to deal effective blows at their adversaries, are apt to strike at them through neutral commerce. Since the transactions of neutral markets take place on neutral territory, they cannot be directly interfered with by the states at war. But indirectly they can be injured by interference on the high seas with vessels which carry goods to and from their ports. Practice has varied from time to time, and sometimes an exceptional usage has been adopted for a while by powerful belligerents (see INTERNATIONAL LAW). Thus the right of confiscating not only enemy goods found on board a neutral ship, but the ship as well, was claimed and exercised by France and Spain at the beginning of the last century. A hundred years later England and France enforced their violent and illegal measures of mutual retaliation at the expense of neutral trade, and to the ruin of neutral markets (see CONTINENTAL SYSTEM; LICENSES (Continental War)). But commercial interests are now far too powerful to be harried with impunity. By the Declaration of Paris of 1856 both enemy goods laden on neutral ships and neutral goods laden on enemy ships are allowed to pass freely to and from neutral ports (see DECLARATION OF PARIS). Leaving out blockade which is *sui generis*, the only exceptions to the rule of freedom are found in the cases of enemy ships, enemy goods on enemy ships, and contraband of war carried in neutral ships. The two former would disappear if private property at sea were exempted from warlike capture. The latter will probably remain as long as wars continue; for no power is likely to deprive itself of the right to seize munitions of war on the way to an enemy. During the American civil war of 1861-1865, each side bought enormous quantities of arms and ammunition in England; and the neutral British port of Nassau in the Bahamas became the centre of a considerable trade in goods intended to run the blockade of the ports of the Southern Confederacy. In the war of 1904-5 between Russia and Japan the former power purchased all sorts of weapons and warlike stores in Germany, from where they were conveyed to her across her land frontiers. The law of contraband is powerless to deal with a trade of this kind which does not cross the seas and cannot be intercepted by the other belligerent.

[The references given at the end of the articles cited in the text will apply to the present subject. For the sudden rise of Nassau, and the trade in contraband of war between England and America, see the British and American *Cases* presented to the arbitrators at Geneva in 1872, and M. Bernard's *Historical Account of the Neutrality of Great Britain during the American Civil War*.] T. J. L.

NEUTRAL PROPERTY may be described as the property of neutral states, subjects of neutral states, or enemy subjects domiciled in neutral states. But if a neutral subject is domiciled in an enemy's country, his property connected with the enemy domicile is regarded as enemy property for purposes of belligerent capture, as also is property at sea owned by neutrals, not incorporated in enemy commerce or subject to enemy control. Moreover, if an enemy subject is domiciled in a neutral state, only his property connected with the neutral domicile ranks as neutral property. Neutral property in neutral territory is inviolable; but if the land forces of one belligerent occupy a district belonging to the other, they may subject neutral property found therein to all the severities of warfare. At sea neutral vessels, if public, are free from belligerent search, but, if private, must submit to it. They may be subjected to capture and condemnation for an attempt to run a lawful blockade or perform an unneutral service. The usual penalty for carrying contraband of war is confiscation of the cargo only; but in aggravated cases the vessel also is condemned. Neutral goods are not liable to confiscation unless they are laden on board an armed enemy vessel, or connected with a breach of blockade, or contraband in their character. On an ordinary merchantman engaged in ordinary traffic they are safe, even under the enemy's flag (see DECLARATION OF PARIS and the sections on *War* and *Neutrality* in INTERNATIONAL LAW).

See Hall, *International Law*, pt. iv. T. J. L.

NEUTRALITY. See INTERNATIONAL LAW.

NEVES, JOSE ACCURSIO DAS (1766-1834), a Portuguese economist.

He wrote *Variedades sobre objectos relativos ás artes, commercio y manufacturas* (Lisbon, 1814 ff. 2 vols.). He was a protectionist in his opinions, and possessed a very thorough knowledge of the economic history of Portugal.

[Cossa, *Introduction to Pol. Econ.*, English trans., London, 1893.]

NEW CUSTOMS. The title given to the additional duties on certain goods imported by Edward I. in 1302, in distinction to the duties termed "Ancient Customs — antiqua custuma" (see CUSTOM, CUSTOMS DUTIES).

[Dowell, *History of Taxation*, 2nd ed., vol. ii. p. 79 ff.]

NEW IMPOST. The name under which the EXCISE (*q.v.*) was known when that system of taxation was first introduced in 1643. At first "the prime necessaries of life, flesh and salt," were included, and the tax was, and long continued to be, very unpopular.

[Dowell, *History of Taxation*, 2nd ed., vol. ii. p. 9 ff.]

NEW SUBSIDY. The original import duties in England (see IMPORT DUTIES) were called the "subsidy" of tonnage and poundage. The subsidy of poundage was from 1373 onwards for a long time fixed at a shilling in the pound or 5 per cent *ad valorem;* so that in the language of the customs, subsidy came to mean a general import duty of 5 per cent *ad valorem.* The "new subsidy" was the duty at that rate imposed by 9 & 10 Will. III. c. 23 (1697) and appropriated to the civil list. It was long kept separate in the accounts of the exchequer.

[Hall's *History of the Customs Duties.*]

C. A. H.

NEWBURY, JACK OF, a hero of 17th century chap-books, around whose name gathered a multitude of absurd and mythical stories, was in fact a certain John Winchcombe, a wealthy clothier, who carried on business at Newbury early in the 16th century. "Winchcombe's kersies" were well known in the reign of Edward VI.; and his descendants afterwards made their way into the ranks of the county gentry. It is probable that, anticipating the later factory system, he made an attempt to gather a large number of workpeople under the same roof; but all such experiments must have been put an end to by the act of 1553 limiting the number of looms any clothier might possess.

[Ashley, *Econ. Hist.*, vol. i. pt. ii. pp. 229, 236.]

W. J. A.

NEWENHAM, THOMAS (1762-1831), was member of Irish parliament of 1798, and strenuously opposed the union. After its enactment, he settled in England and endeavoured by his writings to spread a better knowledge of Irish affairs amongst English readers. His works include *A Statistical and Historical Inquiry into the Progress and Magnitude of Population of Ireland*, London, 1805, 8vo, wherein, while holding that the population of Ireland tended to double itself in every forty-six years, and that its then population was nearly 5,400,000, he maintained that Ireland was capable of supporting in comfort a far greater population than this.—*A View of the Natural, Political, and Commercial Circumstances of Ireland*, London, 1809, 4to: this work is divided into four parts, the first dealing with the natural advantages which qualify Ireland for the acquisition of commercial wealth, and the latter three in a somewhat confused manner with the causes which frustrated these. These books were reviewed by MALTHUS (*q.v.*), *Edinburgh Review*, July 1808 and April 1809, vols. xii.-xiv. His last publication, *A Series of Suggestions Relative to Ireland*, Gloucester, 1825, 8vo, contained the substance of the evidence he would have given before a House of Commons committee on Ireland had his health allowed him. In this he advocated the establishment in Ireland of banking companies, and strongly opposed the introduction of a poor law (see NICHOLLS, Sir G.), and any system of state-aided emigration.

[*Dictionary of National Biography*, vol. xl.]

H. E. E.

NEWMARCH, WILLIAM (1820-1882). This eminent economist and statistician was a native of Thirsk, Yorkshire. He had but few of the advantages that a middle-class education now affords, and was mainly indebted for his general training to habits of self-culture, and to his association at an early period of life with men engaged in active business pursuits. His earliest bringing-up was as clerk to a distributor of stamps in his native county, then he moved into the service of the Yorkshire Fire and Life Office at York, and afterwards into the banking-house of Messrs. Leathem, Tew, and Co. of Wakefield. Marrying young, and anxious for a wider scope for the exercise of a talent for economical subjects, Newmarch removed to London. There he obtained constant employment on the staff of the *Morning Chronicle* newspaper, and became at the same time second officer of the Agra Bank established in London in 1840. His knowledge of the principles of banking and of general business gained him the influential support of leading men in the city, particularly of William TOOKE, whose close disciple he became in all that relates to economic science and banking. Newmarch in 1851 resigned his position at the Agra Bank to become secretary of the Globe Insurance Company. Tooke was desirous of continuing his book on the *History of Prices and of the state of the Circulation from 1792*, and upon Newmarch's offering to co-operate with him in writing two additional volumes, the offer was gladly accepted, in the same spirit as Mr.

Danson's offer of assistance had previously been welcomed in the case of the fourth volume, published in 1848. The fifth and sixth volumes in their turn demanded some years of careful study. A vast body of statistics had to be methodised on novel and original principles of treatment. At length, in 1857, the public obtained the advantage of these researches, and they were accepted with approval, both at home and abroad. In Germany, especially, the two volumes were thought worthy of translation and of use in several universities. In 1857, Newmarch gave evidence before the select committee of the House of Commons on the Bank Acts. Like Tooke, he was opposed to the fixing of legislative limits to the issues of the Bank of England, or to the setting aside of a fixed amount of bullion as a guarantee for the circulation. In place of this he advanced the plea that legal convertibility would adequately secure against over-issue. He also advocated a discontinuance of the separation of the issue and banking departments of the Bank of England.

Newmarch had long been associated with the Royal Statistical Society of London as one of its honorary secretaries, he took the utmost interest in its meetings, and in 1869-1871 became its president in succession to Mr. Gladstone. He was also for many years secretary of the Political Economy Club, and was elected a fellow of the Royal Society and a corresponding member of the academy of moral sciences of the Institute of France. In 1862 he quitted the service of the Globe Insurance Company and became the chief officer in the banking-house of Glyn, Mills, and Co., where he remained until shortly before his death in 1882.

Newmarch for more than thirty years contributed some of his best work to the public press, as mentioned previously, to the *Morning Chronicle*, where, in 1853, a series of his papors appeared on the new supplies of gold. Reprinted in London, in 1853, in a volume of 122 pages 8vo, with five additional chapters, they attracted a great deal of public attention, as containing by far the most valuable review attainable on the Californian and Australian gold discoveries, with facts and statements relative to their actual amount, and their present and probable effects.

In 1855 he published an essay *On the Loans raised by Mr. Pitt during the first French War, 1793-1801, with some Statements in Defence of the Methods of Funding employed.* The case was supported by elaborate calculations respecting each loan, supplied by Mr. Frederick Hendriks, and the main contention of the essay was that W. Pitt, in his plans of borrowing, did the best that could possibly have been done for England under the circumstances of the times. The arguments were controverted in a published series of lectures to the university of Oxford by Professor Rickards, but were warmly defended by Earl Stanhope in his biography of Pitt.

In 1861 Newmarch was president of the economic section of the British Association at the meeting in Manchester, and in his address he submitted that full as the thirty years then past had been of scientific achievements, those of economic science and statistical inquiry had a place in the first rank, and had arrived at an intermediate point, at which, after long debate, many of the earlier controversies are finally settled, and from which the way can be seen to a higher level, the least doubtful result of our experience being the discovery that the most solid progress is made by guiding ourselves in the main by close observation of facts, and by employing speculative and hypothetical reasoning under the most cautious conditions, and always with distrust and reserve.

Amongst the most important of Newmarch's contributions to the periodical press, journals weekly and daily, and reviews and magazines, which, although anonymous, did no little in furnishing the public with sound views on banking, free trade, and currency, and on business principles generally, may be mentioned his annual "Commercial History of the Year" in the *Economist;* this was commenced in 1863 and continued down to 1882. Besides this annual contribution of facts and figures on which a superstructure of able reasoning was raised, Newmarch had long been a valued contributor to the *Economist* during the editorships of Mr. Wilson, Mr. Bagehot, and Mr. Inglis Palgrave, and the suggestion came appropriately from the pages of that journal (during the editorship of Mr. Palgrave), that if his surviving friends desired to promote some public memorial of him, no better form of it could be devised than the foundation of a professorship under his name of economic science and statistics. In the result, a subscription was made by them with this object, and the sum of about £1500 contributed for the endowment of the Newmarch lectures at University College, London. F. H.

NEWTON, Sir Isaac (1642-1727). For particulars in regard to Newton's scientific, theological, and other work, reference must be made to the various biographical notices indicated below; it is here only proposed to deal briefly with his work in connection with the Mint and currency questions.

Newton's long association with the Mint arose primarily from the fact that his old college friend, Charles Montague, was Chancellor of the Exchequer in 1695, when the state of the currency was causing very grave anxiety through the prevalent practice of clipping and the impossibility of preventing

the good coins issued by the Mint from being immediately withdrawn from circulation and either melted or exported. The confusion which existed at that time is eloquently described in chap. xxi. of Macaulay's *History*, and some account is also there given of the steps taken to remedy the evil. Montague and Somers, the Lord Keeper, were associated with Newton and Locke in this great work, Newton being appointed Warden of the Mint by royal warrant dated the 13th April 1696, in succession to Benjamin Overton who had been made a Commissioner of Customs. On the death of the Master and Worker, Thomas Neale, Newton was promoted to that office by warrant dated the 3rd February 1700, the appointment dating from Christmas day, 1699. He retained this post until his death in 1727. The warrants confirming his appointment at the beginning of the reign of Anne and of George I. bear the dates 11th June 1702 and 1st January 1714 respectively.

It is hardly necessary to state that in Newton's day the Mint was located in the Tower of London, where it occupied the entire space between the outer rampart and the inner ward or ballium. As Master he was provided with an official residence situated immediately to the left on entering the Byward Tower, but to what extent he occupied it is not positively known. An interesting plan of the Mint buildings, prepared in 1700, is still preserved in the Royal Mint on Tower Hill.

In view of the fact that the last thirty-two years of his life were thus spent in superintending the currency of the country, it is remarkable that so little information of an important character has been published in regard to this portion of the great philosopher's work. Beyond the text of the several warrants referred to above, and occasional references to his attendance at board meetings, reports, etc., the Mint records are silent as to his doings, and even the voluminous life by Brewster, extending to upwards of a thousand octavo pages, dismisses the subject with a few pages, in chap. xix., and these deal with petty administrative difficulties rather than with larger questions such as that which led to his appointment in the first instance. On such questions Newton's opinion seems always to have been acted upon, and his classical Reports of 1702 and 1717 on the relative values of gold and silver and the rating of the GUINEA (*q.v.*), prepared at the instance of the Lord High Treasurer, have frequently been reprinted. The records of the Treasury, however, are rich in evidences of his wide knowledge of matters directly or indirectly relating to currency, and between the 2nd May 1696, the date of "Dr. Newton's oath as Warden of ye Mint," and the 10th November 1725, when he reported on "Portugal coins," the allusions to him in the *Calendar of Treasury Papers* are very numerous, numbering ninety-eight in all. It is impossible within the limits of a short article to discuss the many important matters dealt with in these papers, but a few may be mentioned in order to show at once their importance and their variety. Cases of clipping and counterfeiting are very numerous: he was called on to deal with many memorials, including one in 1697-98 from the well-known engraver Roettier, who supplanted Simon in the reign of Charles II., and, in 1722, to act as Comptroller of Wood's copper coinage for Ireland, rendered so famous by the abuse of Dean Swift, as well as of a similar coinage for the West Indies. Such questions as the watermarking of paper, melting of silver bullion with "pit-coal," and the artificial raising of the price of tin, were submitted to him for report, and it is interesting to note that in most cases the reports which have been preserved, many of considerable length, are entirely in the handwriting of Newton.

It will be convenient to enumerate here for reference his principal reports on currency questions, with their dates.—28th Sept. 1701. Memorial to the Treasury as to the influence of recent changes in the French currency on the relative values of gold and silver coins in England. —7th July 1702. Report to the Lord High Treasurer on the value of foreign gold and silver coins, and on the supply of silver coins in this kingdom. — 21st Aug. 1711. Report on a Spanish two Ryall piece.—7th Oct. 1712. On the rating of French money for the use of Her Majesty's forces at Dunkirk, and on the exchange with France and Holland.—21st Sept. 1717. On the state of the gold and silver coins of the kingdom, and on the relative value of gold and silver. — 12th April 1720. Report "On the value of Imperial dollars both intrinsically and by way of exchange with Sweden."—10th Nov. 1725. Report on five Portuguese gold coins varying in value from 4s. 4d. to £3 : 11 : 6½.

In regard to the views held by Newton on the general principles of currency, the claim sometimes advanced that he should rank as a bimetallist must not be overlooked. Jevons showed at some length, in an unfinished paper mentioned below, that this view is erroneous. He there states explicitly that Newton's "scheme is not bimetallism," and he adds, quoting from Cantillon, that in reducing the rating of the guinea to twenty-one shillings, "Newton" did not intend to determine between gold and silver moneys a strict proportion as to price, "that is a proportion corresponding with their market price." The currency troubles of Newton's day, complicated though they were, arose mainly from variations in the values of gold coins when measured in silver. the standard of the country, and it would be difficult to imagine more convincing evidence of his far-seeing judgment than the simple fact of our sovereign of to-day being the direct outcome of Newton's valuation of the guinea in 1717.

E. R.

NICÉRON, JEAN PIERRE (1685-1738), was a French Barnabite monk.

He compiled 44 vols. of *Mémoires pour servir à l'histoire des hommes illustres de la République des Lettres avec un catalogue raisonné de leurs ouvrages*, 1722-1745, full of copious and valuable bibliographical information extending to writers who have no claim to the title of illustrious. These *Mémoires* were translated into German a few years after Nicéron's death.

E. Ca.

NICHOLLS, CHEVALIER JOHN, pseudonym of Plumart de Dangeul (see DANGEUL, MARQUIS DE).

Born in the beginning of the 18th century, master of audits in France, published under this fictitious name his *Remarques sur les Avantages et les Désavantages de la France et de la Grande Bretagne par rapport au Commerce*, Amsterdam (Paris), 1754, supposed to be a translation from the English. He also published a real translation of Ulloa: *Le rétablissement des manufactures et du Commerce d'Espagne*, Amsterdam, 1755.

E. Ca.

NICHOLLS, SIR GEORGE (1782-1865), public servant, entered the maritime employ of the East India Company, at the age of fifteen. After retiring from that service (1815), he settled in 1819 at Southwell, Notts. His attention had been first drawn to the subject of the poor law by reading the Report of the House of Commons committee of 1817. In 1821 he became overseer of the poor for the parish of Southwell, and forthwith set on foot most valuable reforms in administration. The importance of this work is not to be gauged by the extent of the area over which it operated, but by the fact that the Southwell workhouse, together with that of Bingham, was the model on which the whole workhouse system of the new POOR LAW was based. Nicholls was for the most part absent from Southwell after 1823, and left it altogether in 1827, but his work survived, and he relates, with pardonable pride, how, on the occasion of a subsequent visit, he was cordially greeted by a group of labourers, who told him that he had been their best friend, because he had made them help themselves. It was therefore peculiarly fitting that, on the passing of the Poor Law Amendment Act, Nicholls should have been—in August 1834—selected as one of the three new commissioners. He was, at the time, the manager of the Birmingham branch of the British Bank of England, and, so great was their sense of his value, that he was offered an additional £500 per annum if he would remain in the bank's service. Although the broad lines of poor-law policy were settled by the act of 1834, the change to be effected was so great that it was necessary to leave much, with regard to the time and mode of enforcing that policy, to the discretion of the commissioners. The formation of unions, the provision of workhouses, and the issuing of orders for the guidance and government of boards of guardians, were matters requiring the exercise of the utmost tact as well as ability. In 1836 Nicholls visited Ireland, with the view of reporting on the expediency of introducing an Irish poor law. The act, as finally passed in 1838, followed mainly the lines of his report. From 1838 to 1842 Nicholls remained in Ireland, to supervise the introduction of the new law. Important as had been the work of the poor-law commissioners, it was generally recognised that their strength would be increased by coming more closely into touch with parliament. The powers of the board were therefore, in 1847—10 & 11 Vict. c. 109—transferred to commissioners forming part of the government of the day, the services of Nicholls being retained as secretary to the new board. In 1851 he retired, and was made a K.C.B. The loss to the country of his services was given ample expression to in the House of Lords, where Lord Fortescue, who had seen much of him in Ireland, eulogised his great abilities, "persevering industry" and "great self-devotion to the public service," and Lord Brougham, who had conducted the Poor Law Amendment Act through the House of Lords, expressly affirmed that he "was the great and principal agent in devising the new law, and in carrying it afterwards into execution." The first years of his leisure Nicholls devoted to writing the history of the law, in the administration of which he had borne a leading part. When he died he was an old man, and had become, as so often happens, to some extent forgotten. At the present time, however, we are better able to value his services. If, between the advent of democracy in England and its final triumph in our villages, there has been a breathing space of sixty years, wherein the steady and continuous, though incomplete, depauperisation of the labouring classes has gone on, under the operations of a law often ahead of the public opinion of the day, it is to Nicholls more perhaps than to any one man that the result is due.

Nicholls' writings include: *Eight Letters on the Management of our Poor and the General Administration of the Poor Laws*, by an overseer, 1822 (reprinted from the *Nottingham Journal*).

—*The Farmer*, London, 1844, and *On the condition of the Agricultural Labourer*, London, 1847, 12mo.—*Reports* dated respectively 15th November 1836, 3rd November 1837, and 5th May 1838, in connection with the proposed Irish poor law, the substance of which is given in Nicholls' *History of the Irish Poor Law.*—*A History of the English Poor Law*, 2 vols., London, 1854, 8vo.—*A History of the Irish Poor Law*, London, 1856, 8vo.—*A History of the Scotch Poor Law*, London, 1856, 8vo.

On Southwell Workhouse, Appendix A of Poor-Law Commission Report, 1834; Mr. J. W. Cowell's Report, pp. 613*a*-618*a*.] H. E. E.

NICOLAI (18th-19th century) undertook historical research on laws respecting food supply and finance in the papal states. In one of his most important reports, Nicolai discusses the organisation of the land tax, arranged by Pius VII., for all parts of the kingdom, bringing together the threads of economic and financial tradition in the papal states. Nicolai studies the different methods of taxation, reform in which was felt necessary by the government, and gives the preference to the land tax in agricultural districts, together with some indirect taxes on consumption to equalise the incidence as far as possible. He agrees substantially with the classical doctrine prevalent at the time, which regarded the land tax, established on the system of the CATASTO (*q.v.*), as the pivot of fiscal organisation. Nicolai's other treatises contain remarks on the supply of food.

NIFO, AGOSTINO (1473-1538), was born in Sessa (southern Italy) of a noble family. From 1492 to 1498 he taught philosophy at the university of Padua, then at Salerno and Naples. Many honours were bestowed on him by Leo X., and he was highly esteemed as a philosopher.

In his moral and political pamphlets he discusses economic subjects, and is a faithful follower of ARISTOTLE. Like other writers of his day, Nifo forms a moral rather than an economic conception of wealth. Riches, in his view, are not to be desired for themselves, but only as means to higher ends; thus wealth, taken as the foundation of prosperity in a state, can only be considered the means or instrument of its prosperity.

In the distinction of the different kinds of riches, and in the difference between riches and money, Nifo always follows ARISTOTLE, whilst on other points he adopts the ideas of St. Thomas AQUINAS. He makes a strong distinction between the aims of economic and administrative science and the importance to be assigned to the action of the state in increasing public wealth.

De vera vivendi libertate, Naples, 1530.—*De divitiis*, Naples, 1531.

[See Fornari, *Delle teorie economiche nelle provincie napoletane*, Milan, 1882.] U. R.

NIHILISM (RUSSIAN) is a term connoting various forms of social dissatisfaction, political and economic, mainly among the better-educated classes of Russia. As the name implies, its aim is the annihilation of existing social institutions, and in this respect it forms part of the negative movement of the present day, against all forms of traditional authority, and, so far, it coincides with ANARCHISM. In Russia, however, it is not capital and the *bourgeoisie* that are the object of attack, but government as such. Nihilism arises out of local causes—political, economic, and racial,—and is the outcome of two opposite tendencies of the Slave mind—absolute idealism and cynical realism,—which in combination produce impatient destructiveness and revolutionary passion. The former is represented by Herzen, the latter by BAKOUNIN. Philosophically, the early promoters of nihilism belonged to the Hegelian school (see HEGEL), in which they saw, like K. MARX and his followers, the basis for their own theories of social revolution. Nihilism also owes some of its ideas to the pessimistic scepticism imported with modern French literature, which easily assimilates with the indigenous tendency towards melancholy mysticism. These two act as dissolvents. The passionate cultivation of Physical Science by the fast-growing "literary proletariate" has much encouraged this tendency. The disciples of the materialists, Büchner and Moleschott, are ardent advocates of a complete demolition of the present social system. Politically, nihilism is a reaction against repression by despotic government and an oppressive and corrupt system of BUREAUCRACY, it is liberalism and constitutionalism in some of its aspects, but reforms initiated by "imperial nihilists," such as the liberation of the serfs, have encouraged the movement. To some extent, too, it is encouraged by pan-Slavism as a popular agitation in favour of a "federal united republic of all Slavonic tribes." Even the ancient institution of the MIR, as a relic of agrarian communism, serves as such as a type of democratic self-government, and suggests the extension of its method as the "rural commune" to the whole edifice of society. And, lastly, some of the boldest agents of nihilism are to be found among the Jewish youth, whose zeal has been enlisted in the cause as means of avenging the wrongs

done to their race by the official class. Having stated the causes of the movement, we may now proceed to follow its course. Nihilism proper begins in 1858, following immediately upon the military collapse of the empire, though the secret machinations of radicalism go back to 1846-49. The nihilistic creed, suggested in principle by PROUDHON, was not formulated till 1867, though a sanguinary manifestation of "the central revolutionary committee" appeared in 1862. The growth of socialism in Germany and France from 1863 to 1871 promoted Russian nihilism so much that in the years 1873-76 it displayed great activity, especially in publishing and disseminating periodicals, pamphlets, and appeals in various forms. Then, too, began the rage on the part of the aristocratic youth to "go among the people," living and working among them in disguise, thus to become "simplified" with a view to indoctrinate the operative population with nihilistic ideas. The result was that in 1873, some 156 of them came into collision with the police, whilst 3800 were more or less complicated in the "monster-process (trial) of 193" in 1874-75. Having suffered a slight relapse in 1876-77, in consequence of the Russia-Turkish war, nihilism revived in 1878, when Vera Sassoulitzsch attempted to assassinate General Trepoff, and thence began the duel between the nihilists and the authorities which led to the death of the Czar, Alexander II. (1855-1881), who was "condemned" by the "executive committee" in August 1879. In that year it is computed there were at least 20,000 suspects, the journal *Will of the People* being the organ of the secret conspiracy. Under the reign of the late Czar, Alexander III. (1881-1894), which has been termed the "social empire," and since, nihilism has not appeared much on the surface, but the political trial of five nihilists in 1890, as well as the methods adopted to protect the life of the czar against secret attack, show that the terror was by no means over.

The actual demands of nihilism, as far as they are put into distinct form, are, on the part of the moderate section, amnesty of political offenders, the abolition of the secret police, inviolability of the home, freedom of the press, of speech and meeting, religious equality, the autonomy of towns, communes, and provinces, and the control of public functionaries by county councils, the appointment of imperial commissions of inquiry into the economic condition of the people, and that of a ministry for the encouragement of industry, agriculture, and co-operative associations, with a view to develop the resources of the country. The demands of the new advanced section are, the abolition of monarchy, state-religions, and landed proprietorship; and a free soil for the sustenance of the whole population; and the discontinuance of a standing army and governmental administration; meanwhile the sentence of death is pronounced on all public functionaries hostile to these designs. A proclamation of the executive committee drawn up shortly after the attack on the emperor, Alexander III., sums up the demands of the terrorists as follows:—A representative democratic form of government; permanent parliaments, with full powers to regulate matters of state; extension of local government in the provinces; autonomy of rural communes; the land to be put into the possession of the people; means to be found for placing the factories into the hands of the ARTÉL, or artisan gild; transformation of the army into a militia; liberty of the press and industrial combination.

From this it will be seen that, in its economic bearings, nihilism resembles in many respects the more violent forms of socialism; though one of its most distinguished representatives, Prince Krapotkin, deprecates the collectivist programme, since he objects to authoritative communism, but demands a "free communism" which should secure "economic freedom." Thus the essence of nihilism is "absolute liberty," as Herzen said in 1849, "freedom from all received opinions and traditional hindrances and difficulties, the historical block which prevents the advance of intelligence and stops the way of western progress." The block is the impediment of historical continuity, but the application of this destructive principle of extreme nihilism, which is identical with the extremest form of individualism, would render the historical development of society impossible, it would put an end to society itself.

M. K.

NITZSCH, Karl Wilhelm (1818-1880), became in 1848 extraordinary professor of history at Kiel, in 1858 ordinary professor there, in 1862 professor at Königsberg, and in 1872 at Berlin. He was the author of several works on Roman and mediæval history, chiefly in their constitutional and economic aspects; and by these, as well as by his personal influence as a teacher, he gave a powerful stimulus to the study of economic history in Germany.

His most noteworthy works are those which give the results of his own minute investigations into German town life in the 11th, 12th, and 13th centuries. These are *Ministerialität und Bürgerthum im 11. u. 12. Jahrh.* (1859), published as the first volume of *Vorarbeiten zur Geschichte der Staufischen Periode* which was never completed; and then after a long interval the two articles *Ueber die niederdeutschen Genossenschaften des xii. u. xiii. Jahrh.*, and *Die niederdeutsche Kaufgilde*, printed in the *Monatsb. d. Berl. Akad. d. W.* for 1879 and 1880 respectively. A number of other papers of lesser importance are collected in *Deutsche Studien* (1873). In the *Geschichte des deutschen Volkes, bis zum Augsburger Religionsfrieden*, put together by his pupil G. Matthäe after Nitzsch's death, from his lecture notes and other papers (1882-83; 2nd ed. 1891-92), will be found a sketch, drawn in bold and masterly outline, of the whole development of German society and institutions. He was one of the earliest, if not the earliest, of the professional historians to make the economic element the dominating one in the story of national life. Some account and a criticism of his German history and of his views on mediæval social development are given in the *Econ. Journal*, iii. 686-690.

W. J. A.

NOBLE, a gold coin first issued in 1344, half and quarter nobles being issued at the same time. The following table shows the variations of the coin in different years:

Year.	Value.	Weight.	No. coined from Tower pound.	Fineness.
	s. d.	grains.		
1344	6 8	$138\frac{6}{15}$	$39\frac{1}{2}$	carats 23 grains $\frac{1}{2}$; alloy $\frac{1}{2}$ gr.
1346	...	$128\frac{4}{7}$	42	...
1351	...	120	45	...
1414 1422	...	108	50	...
1460	8 4	...	...	...
1465	10 0	120	45	...
1527	6 8	$71\frac{1}{9}$	...	...

An issue was ordered in 1470-71, but no specimens of it are known, and it was probably not executed. The coins of 1465 were also known as "royals" or "ryals," those of 1527 as "George nobles"; in the latter year there seems to have been also an issue of nobles worth 11s. 3d. These coins gave way finally to sovereigns and half sovereigns.

Note.—The Tower pound, which was abolished by Henry VIII., was $\frac{3}{4}$ oz. lighter than the lb. troy.

[Ruding, *Annals of the Coinage of Great Britain*, 1840.—Kenyon, *Gold Coins*. Where there is a difference in the dates the table follows Ruding.]

E. G. P.

NOBLE OF RAYMOND LULLY. There was a tradition as late as Camden's time that the first English nobles, coined in 1344, were produced by alchemy in the Tower of London by Raymond Lully, the famous mediæval "philosopher"; the inscription borne by the coins,—*Jesus autem transiens per medium eorum ibat*—in reality a charm, was supposed to be mystical. But Lully died many years before this coinage, probably in 1315, and hence could not have assisted in it. In his lifetime he was supposed to have practised the art of transmuting baser metals into gold.

[Camden's *Remains*, art. "Money."—Tyrwhitt's *Chaucer*, vol. iv. p. 183.—Ruding's *Annals of the Coinage of Great Britain*, 1840, p. 220.]

NOMINAL VALUE. See Value.

NORMAL VALUE. See Value.

NORMAN, G. Warde (1793-1882), a clear-headed writer on social, political, and economic questions of his day. In 1833 (reprinted in 1838) he published *Remarks on some Prevalent Errors with respect to Currency and Banking: and suggestions to the Legislature as to the Renewal of the Bank Charter*. The subject was treated under four distinct heads, as follows:

1. The principles on which a paper circulation should be regulated.

2. Examination of suggested remedies for the evils of the present system.

3. Remarks on the late and previous periods of commercial suffering connected with derangement of the currency in this and other countries.

4. The writer's view of the best course to be pursued in the actual state of affairs.

In 1841, *Letter to Sir C. Wood, Bart., on Money and the means of economizing the use of it*. This was published after the sitting of the Committee of the House of Commons, of which Sir C. Wood was Chairman, to enquire into the working of the Bank Charter Act, and at which Norman was examined at length.

In 1849 *An Examination of some Prevailing Opinions as to the Pressure of Taxation in this and other Countries* (4th ed. 1864), in which he established the following propositions:

1. That the financial burdens of England did not seriously press on her resources, and that,

when compared with her augmented wealth, their pressure had been greatly diminished since 1815.

2. That the pressure of these burdens, when compared with the means of bearing them, were heavier in other great European states than in England.

3. That on the whole a spirit of frugality is more apparent and influential in the English Government than in those with which it is usually brought into favourable comparison.

In 1860, *Remarks on the Incidence of Import Duties*. This was written fifteen years earlier, and was a reply to publications by Col. Torrens, called *The Budget* and a *Letter to Sir R. Peel*.

In 1869 *Papers on Various Subjects* (London, 1869, 8vo). This consists of reprints of papers published at various times and on various subjects, many being articles in newspapers—many very interesting, treating, amongst other things, of protection, the laws of partnership, the poor laws, the national defences, the new reform bill, the export of silver to India, the money market, the housing of labourers, the land question, and democratic government.

On almost all these questions he took a peculiarly advanced, and almost modern, standpoint. He pointed out the fallacies of protection and the mercantile system. A. L.

NORMANTE Y CARCAVIELLA, Doctor Lorenzo (second half of 18th century), was probably the first public teacher of political economy in Spain. The uncompromising tone of his lectures and the enthusiastic success of the public discussions which the Royal Aragonese Society organised under his inspiration in Saragossa, were near bringing him into trouble with the Inquisition. His *Discurso sobre la utilidad de los conocimientos económico-políticos y la necesidad de su estudio metódico* (Saragossa, 1784) is the inaugural address, which he delivered at the beginning of his course of lectures. The *Proposiciones de Economía civil y Comercio* and the *Espiritu del Sr. Melon* (1785 and 1786) were written to serve as subjects of debate in the above-mentioned disputations.

[Colmeiro, *Bibl. de Economistas Españoles.*]

E. Ca.

NORTH, Sir Dudley (1641-1690), entered, at an early age, the mercantile profession, and showed such aptitude that, when twenty-one, he became the leading merchant at Constantinople of the Turkey company. He returned to England in 1680, having made a large fortune. In 1683 he was appointed one of the commissioners for the customs, but was afterwards transferred to the treasury. In both these offices he carried out important reforms. At the accession of James II. he returned to the customs. He was the author of a bill imposing new duties on sugar and tobacco. Unlike most of the leading tories, he did not leave London after the landing of William of Orange. The remaining years of his life were occupied in private speculations and in the care of the affairs of his brother the Lord Keeper Guildford's children. We are told that he was much scandalised at the English Poor Law (*q.v.*), but unfortunately his views have not come down to us.

His importance, in the field of economics, rests on his *Discourses on Trade*, London, 1691, 4to, one of the earliest and most luminous statements of Free Trade (*q.v.*) principles. Trade is an exchange of superfluities. Wealth consists not in the precious metals, but in the power to satisfy wants. The error of the Mercantile System (*q.v.*) is thus clearly seen, but North avoids the opposite error. Gold and silver have *some* value in themselves, though their main importance depends on their convenience as a medium of exchange. Money is a commodity of which there may be a glut as well as a scarcity. The common cry of want of money involves a fallacy. The real mischief is the failure to get a profit. This may be the result either of a glut of goods, or of the sudden closing of accustomed markets, or of diminished consumption. It is these causes which require remedying, and the best remedies are activity and prudence. Laws against exporting the precious metals must react against the nation enacting them. "A nation in the world, as to trade, is in all respects like a city in a kingdom, or a family in a city." The main spurs to trade are the appetites of man; hence measures, *e.g.* sumptuary laws, which tend to restrain those appetites, clog industry. The rate of interest depends upon the proportion of lenders to borrowers (see D. Hume). "It is not low interest which makes trade, but trade increasing the stock of the nation makes interest low. To attempt to lower the rate by law is to go contrary to nature." As for the theological arguments, "by them 3 per cent is no more lawful than 4 or 12." North clearly demonstrates the folly of tampering with the coinage. He advocates a moderate seignorage, the wisdom of which advice was proved by the result of the free coinage of silver in 1696-98. The final conclusion of the whole matter is "that laws to hamper trade, whether foreign or domestic, relating to money or other merchandise, are not the means to make a people rich and abounding in money and stock. But if peace be procured, easy justice maintained, navigation not clogged, the industrious encouraged by indulging them in the participation of honours and employments in the government, the stock of the nation will increase, and consequently gold and silver abound, interest be easy, and money cannot be wanting."

[Roscher's *Political Economy*, 13th ed. trans. by J. Lalor, New York, 1878, 8vo, 2 vols., contains numerous references to North. See also Cossa's *Political Economy*, trans. by L. Dyer,

1893, 8vo, and M'Culloch's *Literature of Political Economy* and Introduction to *Tracts*, 1856. For biographical details see *Life of Sir Dudley North* by Roger North, 1744, 4to, and *Dictionary of National Biography*, vol. xli.] H. E. E.

NORTH, THE HON. ROGER (1650-1733), was the sixth son of the fourth Lord North. He read for the bar.

His connection with economic science lies in his authorship of *A Discourse of the Poor, showing the pernicious tendency of the laws now in force for their maintenance and settlement* (London, 1753, 8vo). In this work, after setting forth the existing laws and their inefficiency, North deprecated the use of punishments, which he thought did not influence offenders so effectively as laws of encouragement. He further maintained that the laws for the poor did not help but rather hurt them, and charges these laws with the following consequences: depopulation, enhancing of labour, fall of lands, decay of trade, and increase of the poor.

North proposed the repeal of the whole Elizabethan code.

His other publications are:

Examen: or an Enquiry into the credit and veracity of a pretended complete History, viz. Dr. White Kennet's History of England, showing the perverse and wicked design of it, together with some memoirs occasionally inserted, all tending to vindicate the honour of King Charles II., London, 1740, 4to.—*Life of the Right Hon. Francis North, Baron Guilford, Lord Keeper of the Great Seal under Charles II. and James II.; wherein are inserted the characters of Sir Matthew Hale, Sir George Jeffries, Sidney Godolphin, and other most eminent lawyers and statesmen of that time*, London, 1742, 4to, 2nd ed. 1808, 2 vols., 8vo. —*The Life of the Hon. Sir Dudley North, and of Dr. John North, Master of Trinity College, Cambridge, etc.*, London, 1744, 4to.

[For further notice of R. North, see his *Autobiography*, edited by Aug. Jessop, 3 vols., 1890, Bohn's Standard Library, 1846, 8vo.] A. L.

NORTHCOTE, SIR STAFFORD. See IDDESLEIGH, EARL OF.

NOT NEGOTIABLE. The method of crossing cheques with the words "not negotiable" was introduced by the Crossed Cheques Act 1876. That act is now repealed, and its provisions are replaced by §§ 76-82 of the Bills of Exchange Act 1882. The term "not negotiable" is a somewhat unhappy one, because it is often taken to signify that a cheque so crossed is not transferable. As a fact, however, the cheque is transferable, by indorsement on delivery like any other cheque. The effect of the crossing is that the person who takes the cheque does not acquire, and cannot give, a better title to the cheque than that which the person from whom he took it had (see § 81).

In order to render a bill, note, or cheque incapable of transfer, the drawer or indorser must add words to the instrument or indorsement clearly prohibiting transfer. For instance, a cheque may be drawn or indorsed in the form "pay John Smith only," and then John Smith cannot indorse it away (Bills of Exchange Act, § 8). M. D. C.

NOTABLES, ASSEMBLÉES DES. The *Assemblées des Notables* must be distinguished from the ÉTATS GÉNÉRAUX of the old French monarchy; the latter were more or less a national representative body, whilst the former were the result of an *arbitrary* selection and summons by the monarchs, when they desired to consult on important questions, but intended to keep free from the remonstrances and interference of the States General themselves. Higher officials of the state, lay and ecclesiastical, often made up the majority of the *Assemblée;* its decisions were purely consultative. The first *Assemblée des Notables* was called together by Charles V. in 1369; others were assembled by Louis XI. in 1470, by Francis I. in 1526 (to declare void the treaty of Madrid), by Henry IV. at Rouen in 1596, by Richelieu in 1626. They were convoked for the last time in 1787 and 1788 under Louis XVI. and led to the election of the States General of 1789, which was the first act of the French Revolution.

[See, besides works on the *États Généraux*, Beaurepaire, *Louis XIII. et l'Assemblée des Notables de Rouen en 1617* (Rouen, 1883).—*Collection des Mémoires présentés à l'Assemblée des Notables* (Versailles, 2 vols. 1787) and *Procès Verbal de l'Assemblée des Notables* (Paris, 1788).] E. Ca.

NOTABLES COMMERÇANTS. The first tribunal of commerce in France was instituted by an edict of Charles IX. (November 1563), inspired by the Chancellor de L'Hospital ordering the provost and *Échevins* (aldermen) to summon an assembly of notable *bourgeois* for the election of merchants to the position of consular judges. In 1565 this organisation was extended to the whole of the kingdom, and the articles 618 and 619 of the code of commerce of 1807 maintained it, declaring "that the members of the tribunals of commerce will be elected by an assembly composed of notable merchants, and principally of the heads of the oldest and most recommendable firms," with the proviso that "the list of notables . . . will be drawn up by the prefect (of the *département*) and approved by the minister of the interior." After 1840 it became usual for the prefect to take the advice of the tribunal and chamber of commerce and of the *maire;* in 1883 the electoral body was greatly extended, and now comprises all persons in trade being French citizens, paying their trade-license tax, *droit de patente*, and domiciled for at least five years within the jurisdiction of the tribunal. Since then, however, only a small minority of voters (say 1800 out of 42,000 in Paris) take part in the election.

In Belgium the system of *notables commerçants* has also been abandoned; a law of July 1881 declares that "all persons in trade being communal electors, and paying to the state on account of their *patente* [license] a sum of twenty francs, are entitled to vote for the formation of the tribunals of commerce." E. Ca.

NOTE CIRCULATION. The power of issuing notes, that is, of possessing a note circulation, was, in the early days of banking in this country, a privilege greatly valued, and highly profitable to the bank which possessed it. Deposit banking in its strict sense scarcely existed during the infancy of our credit institutions. In the first place, there was but little cash to deposit, and in the next, there were not many persons whose credit was so good that their neighbours would trust them with large sums of money. But to hold the note of a banker in good repute was much easier. The note formed a portion of the circulating medium. Any one to whom the holder owed money was very willing to be paid in that form, and hence, during the early part of the 19th century, the issues of the banks of this country, stimulated partly by high prices, partly by the restriction of specie payments, became very large indeed. Thus in the year 1814, the estimated note circulation of the country was nearly fifty millions, divided as follows:

Bank of England . .	£26,901,000
Country Banks . .	£22,709,000
	£49,610,000

(see Marshall's *Digest*, pp. 55-63). At the present time, April 1907, the figures are about as follows:

Bank of England . . .	£28,800,000
Banks in England, Scotland, and Ireland . . .	14,000,000
	£42,800,000

This diminution alone is evidence of the alteration in the banking habits of the country, but when we add to it the vast increase in the use of cheques, the clearing-house system, virtually built up within the last seventy years, and all the modern methods for economy of circulation, the difference is far greater, and the part played by the note circulation is now far smaller even than appears at first sight.

Yet it would be a great mistake to imagine that the note circulation is a thing absolutely useless to banks, or that its concentration in the hands of one issuer would be desirable. To a great credit institution like the Bank of England, possessing few branches and only coming in a very modified way into connection with the business wants of the country, the note circulation is a very different thing from what it is to the ordinary trading bank which serves the every-day business wants of the community. The subject is too technical and too closely allied with ordinary business wants to be discussed at further length here.

[For further details see articles on Banking and Bank Note, in vol. i.—Bagehot, *Lombard Street.*—F. A. Walker, *Money.—Money, Trade, and Industry.—Report, Banks of Issue, 1840, House of Commons.—Report and Evidence, Bank of England Charter, 1832, House of Commons.—First and Second Reports, Banks of Issue, Evidence and Appendix, 1841, House of Commons.—Report and Evidence, Commercial Distress, 1847-48, House of Commons.—First and Second Reports and Evidence, Commercial Distress, 1848, House of Commons.—Appendix and Supplemental Appendix, Commercial Distress, 1848, House of Commons.—Report on Banks of Issue, 1875, House of Commons.—Report on Bank Acts, 1857, House of Commons*, 2 vols.*—Report and Evidence, Bank Acts, 1858.—Correspondence, Chancellor of the Exchequer and Bank of England, 1861, House of Commons.*—R. H. Inglis Palgrave, *Notes on Banking and Bank of England Analysis*, London, 1873.]

NOTES, BOUGHT AND SOLD. This is the name popularly given to notes sent by stockbrokers to their principals, advising them of the sale or purchase of any stock exchange securities. A person who effects such a sale or purchase of the value of £1 or upwards, who omits to send a note of this description to his customer provided with the government stamp (1d. in the case of the value being under £100, and 6d. in all other cases), is liable to be fined to the extent of £20 (Stamp Act 1891, §§ 52 and 53). The contract notes in question generally contain a clause stating that the contract is made subject to the rules and regulations of the London stock exchange, but this provision has in some cases been disregarded by the courts. Thus it was held by the court of appeal that the rule of the stock exchange, which excludes the operation of Leeman's act, is unreasonable and not binding on a principal to whom it is unknown.

[Perry *v.* Barnett, 15 Q.B.D., 388.] E. S.

NOTICE. Notice sometimes means knowledge of a fact, however obtained, and sometimes knowledge conveyed in a formal manner. In sales of property, knowledge on the part of a purchaser of any defect of title causes him to take the property subject to such defect. But he who purchases *bona fide* for value without notice of any defect will as a rule be protected by the courts on the ground that if a person were liable to be deprived of his property because of secret defects in title, no one would be safe in effecting any purchase.

As an example of express notice, reference may be made to the notice of dishonour that has to be given in the case of a Bill of Exchange in order to make certain parties to the bill liable.

Notice to quit is required whenever a person holds a tenancy from year to year, as such a tenancy

does not by itself involve any fixed time of duration.

Express notices are often necessary during an action in order to give one party the benefit of various legal provisions as against the other party. J. E. C. M.

NOTING OF BILLS. By "noting" is meant the minute made by a notary public on a dishonoured bill or note on the day of its dishonour. The noting consists of the notary's initials, the date, the noting charges, and a mark referring to the notary's register. A label is also attached to the instrument on which is written the answer given to the clerk who makes the notarial presentment.

No direct legal effect is attached to the noting of an inland bill, except that the expenses of noting it can be recovered. It would be convenient perhaps if noting were made *primâ facie* evidence of due presentment. In the case of foreign bills, when protest is necessary, the noting is the incipient protest, that is to say, if the bill has been duly noted on the day of its dishonour, the formal protest may at any time be extended, antedated to the day of noting.

[Bills of Exchange Act 1882, §§ 51, 57, 93. —Chalmers on *Bills of Exchange*, 4th ed. p. 160.] M. D. C.

NOVATIO is the dissolution of an obligation by the formation of a new obligation, as when an informal contract is put an end to by the parties entering into a formal contract. But for the new obligation to put an end to the previous one there must be the intention that it shall do so (*animus novandi*). The object of a novation may either be to change the nature of the relation between the same parties or to substitute a new party in the place of an old one (see also NOVATION). E. A. W.

NOVATION. The substitution of one contract for another. 1. Where a new debtor or creditor is substituted in the place of the former one. For example, if A owes B £100, A may, with the consent of B, substitute C in his (A's) place. 2. Where the parties to a contract remain, but a new form of contract is substituted for the old one. 3. A judgment of a court of competent jurisdiction in favour of a plaintiff discharges the right of action arising from breach of contract. This result is sometimes called MERGER.

[See Hunter's *Roman Law*, London, 1885, and Sohm's *Institutes of Roman Law*, Oxford, 1892, for the Roman law doctrine; and Anson on *Contract*, Oxford, 1892, and Pollock on *Contract*, London, 1894, for the application of the doctrine in English law.] J. E. C. M.

NOY, WILLIAM (1577-1634), a very learned lawyer, was educated at Exeter College, Oxford. He entered parliament in 1604, and at first supported the popular party. In 1627 he was one of the counsel who defended Sir T. Darnell's comrade, Earl, for having refused to subscribe to the forced loan of that year; and in the following year he opposed the granting of TONNAGE AND POUNDAGE (*q.v.*) without conditions. In 1631, however, he became Attorney-General. Finding, by what Lord Campbell calls "musty records in the Tower," that in time of war the king had in the past pressed ships into his service, had further demanded from seaports the equipment of ships, and, on occasions, had ordered adjoining counties to contribute, he, "with his own hand, drew and prepared the writ for ship money," addressed to the sheriffs to provide ships of war, and to assess landholders and others, not having a ship or part of a ship and not serving in one; to levy such assessments by distress or other due means, and to commit to prison the rebellious.

Noy did not live to see the consequences of his measure, as he died in the year in which it was first enforced. He was also the author of the odious project of a soap monopoly. His character is sketched for us by Clarendon in a few vivid sentences. "The court made no impression upon his manners, upon his mind it did . . . of an affected morosity . . . Thinking that he could not give a clearer testimony that his knowledge of the law was greater than all other men's than by making that law which all other men believed not to be so."

Noy was the author of *A Treatise of the Principle Grounds and Maxims of the Laws of England*, London, 1641, 4to, which has passed through many editions. The latest, Albany, U.S., 1870, 8vo, contains a biographical notice. *The Compleat Lawyer*, 1661, 8vo.—*The Perfect Conveyancer*, etc., 1655, 4to.—*Reports of Cases taken in the Time of Queen Elizabeth, King James, and King Charles I.*, London, 1656, 4to; and *A Treatise of the Rights of the Crown*, first published apparently in 1715, 12mo. Noy also left behind him MS. collections he had made from records in the Tower of London, one on matters relating to the maintenance of the royal navy, the other on the privileges and jurisdiction of the ecclesiastical courts.

[*Dictionary of National Biography*, vol. xli. p. 266.—Clarendon's *History of the Rebellion*, vol. i. p. 129, new ed. NUDUM PACTUM. An agreement unenforceable at law. An agreement that wants that element the presence of which will make the law enforce it, is said to be *nudum*. *Ex nudo pacto non oritur actio*. In Roman law agreements were enforced when made (1) by formal words; (2) by delivery of a *res* in four cases; (3) by written entry in an account book: but in four cases, viz. sale, hire, mandate, and partnership, the later Roman law required an agreement only. In English law an agreement is not enforceable unless it is either (1) a con-

tract of record, (2) made under seal or (3) supported by a consideration.

NUMERICAL DETERMINATION OF THE LAWS OF UTILITY is the title given by Jevons (*Theory of Political Economy*, 2nd ed. p. 158) to an operation which he, like GOSSEN, regards as possible—the ascertainment of the form of DEMAND CURVES by statistics of prices and consumption. It may be objected to this phrase, that laws of utility cannot be deduced from laws of price, except on the assumption that price is the measure of utility —the Marginal Utility of money being constant (see FINAL DEGREE OF UTILITY). But, even upon this assumption, there are great difficulties in the way of the statistical operation. First, the utility derived from a set of articles is in general not the simple sum, but some unknown function, of the utilities derived from each. Thus the amount consumed of any one article will vary with the prices of others—especially of those which are substitutes for the one under consideration, as tea is for coffee, or complementary to it, as bats are to balls. Accordingly, to observe the changes in the demand for an article corresponding to the changes in its price is apt to be nugatory unless it can be assumed that the prices of all other articles are constant. Again, utility is not only a complicated function of the amounts consumed, but a variable one, changing its form with every vicissitude of taste and fashion. Professor Marshall has pointed out these and other difficulties (*Principles*, bk. iii. ch. iii.), and attempted to evade them (*ib.*, last section). F. Y. E.

NUYTZ, GAETANO (18th-19th century), was a native of Lombardy, and wrote a book on money of some interest. Nuytz follows the ideas common in his day distinguishing between intrinsic and current value of money. He condemns alterations in money and considers laws against the export of specie useless. He remarks on the conveniency of an abundant coinage up to a certain limit of saturation in the market, and he also recognises the use of paper money in limited quantity. He is not without mercantilist tendencies (see MERCANTILE SYSTEM), which he displays in his investigation into the causes that may increase or diminish money, and also in his proposals for increasing it. There are, in his work, several striking digressions on the theory of value and on luxury and financial matters.

On the whole, however, he has little scientific merit, particularly when compared with other and earlier writers, as well as with those of his own day whose economic ideas were already inspired by new modes of thought.

Forza della moneta nella società, Milano, Anno VI. repubblicano. U. R.

OASTLER, RICHARD (1789-1861), known during his lifetime as the "Factory King" on account of his services to workers in factories, was born at Leeds. His father, originally a linen merchant from Thirsk, afterwards became steward of the Fixby (Huddersfield) estates of T. Thornhill, who had property in land both in Yorkshire and Norfolk. Richard Oastler was the youngest of eight children, and inherited from his father both a reputation for generous sympathies and an active interest in public affairs. On his father's death in 1820 he succeeded him as steward, and in this capacity resided at Fixby Hall, near Huddersfield, where he remained during the most important part of his career. Oastler described himself as "a Tory and a Churchman," and it is therefore not surprising to find that during the agitation for the Reform Bill he strenuously opposed the popular party; even some years later he was averse to mingling personally among mill-hands because, he said, "they were usually Radicals and Dissenters." But his work soon changed this attitude. He first came before the public in Yorkshire as a supporter of William Wilberforce in the agitation for the abolition of negro slavery (see ABOLITIONIST); but though living in the heart of manufacturing Yorkshire, he was totally ignorant of the unhappy conditions of the factory hands in the mills near him. In 1830, however, while on a visit to his friend John Wood, a mill-owner, of Horton Hall, Bradford, Yorkshire, the latter remarked to him, "I wonder you have never turned your attention to the factory system, for I assure you there are cruelties daily practised in our mills on little children which, if you knew, I am sure you would strive to prevent." With characteristic energy, Oastler at once wrote a powerful letter on "Yorkshire Slavery" to the *Leeds Mercury*, then, as now, a highly influential West Riding paper. The letter, dated 29th September 1830, provoked a lengthy correspondence. More than this, it was the beginning of an agitation that lasted many years, for the reform of the conditions of factory labour, especially in the case of children and young persons, and for a reduction of hours of work, which finally resulted in the Ten Hours Bill, and other well-known FACTORY ACTS (*q.v.*). In this agitation Oastler took a leading part both in speaking and writing. Meanwhile, however, he had the misfortune to be imprisoned for debt at the instance of his employer, Mr. Thornhill. He had been dismissed from his stewardship in May 1838 owing to his using his influence in the Halifax and Huddersfield

districts against the new poor law, and though he had repaid all but a small portion of a debt which he owed Mr. Thornhill, he was, two years after his dismissal, thrown into the Fleet Prison (9th December 1840) for this remainder. Here he edited a journal called the *Fleet Papers*, devoted to the discussion of factory and poor-law questions. He remained in prison till his friends, including John Walter of the *Times*, W. B. Ferrand, M.P., John Fielden, M.P., and other well-known factory reformers, got up an "Oastler Liberation Fund" amounting to £3000 to pay his debt (£500 only) and other expenses. He was liberated in 1844, and made a triumphant public entry into Huddersfield, 20th February. He continued his labours as a reformer till the passing of the Ten Hours Act of 1847, but afterwards retired to a small cottage, "South Hill," at Guildford in Surrey, where he lived in poverty and seclusion till his death at Harrogate (22nd August 1861).

Oastler's claim to notice lies in his activity as a reformer of the worst evils of factory life, in spite of bitter opposition. In his opinions he was a protectionist, and opposed the new poor law. A statue was erected to his memory (1869), at Bradford, Yorks, the scene of many of his labours, but he is now almost entirely forgotten by the working classes to whom he gave his life.

[No proper biography of Oastler exists, but one or two sketches of his life have been issued: cp. *Sketch of the Life and Opinions of Richard Oastler* (Hobson: Leeds, 1838, many years before his death); Taylor's *Biographia Leodiensis*, pp. 499-503; *The History of the Factory Movement* by "Alfred" (the pseudonym of Samuel Kydd), London, 1857, gives as good an account of him as any other book, with many extracts from his speeches; and there is a fair biography in the *Dictionary of National Biography* (Smith Elder, 1895); cp. also Gibbins' *English Social Reformers*, (Methuen, London, 1892). Oastler issued numerous controversial letters and pamphlets, now forgotten, and besides *The Fleet Papers* (1841-44), edited a weekly paper devoted to the factory workers' cause, called *The Home* (May 1851 to June 1855).] H. de B. G.

OBJECTIVE EXCHANGE VALUE. See VALUE.

OBLIGATIO is a legal relation by which a determinate person has a legal claim against another determinate person to some act or forbearance on his part reducible to a pecuniary value. Such a relation may arise either from contract, quasi-contract, delict, or quasi-delict. E. A. W.

OBLIGATION. By the older writers on English law, the term "obligation" is used in a restricted sense. It denotes simply a bond under seal, with a money penalty. But now it is used in the wider sense of the Roman lawyers, who employed the term as correlative to *jus in personam*. An obligation is the legal tie (*juris vinculum*), whereby one person is bound to another, to do or abstain from doing some particular act or thing. There is probably a tendency to confine the term to obligations arising from contract, while the obligations arising from wrongs are more usually described as liabilities (see Holland's *Jurisprudence*, ed. iv. p. 199). M. D. C.

OBRECHT, GEORGE (1547-1612), the son of a *syndic*, mayor, of the city of Strasburg, studied law in Tubingen and in France, where he narrowly escaped death during the massacres of protestants at the time of the Saint Bartholomew. He was a celebrated professor of law in his native town, where the *gymnasium* founded by Johann Sturm, in 1538, developed (1621) into a university, and became, after the decay of the Saxon universities, a flourishing centre of academical learning very much under the influence of learned Frenchmen, especially of BODIN (*q.v.*).

Obrecht's economic writings were, after his death, privately printed in 1617 by his son. They were only published in 1644 under the title of *Funff underschiedliche Secreta Politica* They bear strong evidence of the influence of Bodin; thus Obrecht maintains that the property and not the persons of the subjects ought to be assessed, and that necessaries ought never to be taxed. At the same time, Obrecht remained free from any leanings to the mercantile school. He insisted on an honest monetary policy, as well as on the usefulness of population statistics, but under this last respect with fiscal, rather than scientific aims.

In imitation of Bodin, who himself had been influenced by the existence in Italy of institutions founded to endow young girls at the time of their majority, Obrecht suggests the foundation of an *Aerarium Liberorum* extended to children of both sexes, in which parents would be obliged to effect a deposit at the time of the birth; the deposit was to bear a yearly interest of 6 per cent, which being capitalised, the whole was to be repaid to the children at the age of twenty-one for the sons, and seventeen for the daughters. But here also, fiscal prepossessions were lurking under the appearance of a provident system, for in case of death in the interval, the larger part of the collected money was to accrue to the public treasury.

Obrecht has been considered as a striking personification of his time, but not in advance of it (Roscher, *Geschichte der Nat. Oekonomik in Deutschland*, pp. 150-158). For his standing as a jurist, see Stintzing, *Geschichte der deutschen Rechtswissenschaft*, vol. i. pp. 672-676, who also mentions that in 1617 an unauthorised and spurious edition of the *Secreta Politica* appeared in Rostock (1617) under the title of *Oeconomia Institutionum Obrechtiana*. E. Ca.

OBSERVATION AND EXPERIMENT. Every science is founded on experience. The scientific inquirer either may take experience as it comes to him, casually, or he may make experience for himself. In the former case he

learns by observation, in the latter he learns by experiment. Observation is our ordinary, and in some branches of science our only, resource, but experiment, where it is possible, affords a more direct access to knowledge. For if the student conducts his experiment in a scientific spirit, he knows all the conditions which can affect the result, whereas, when he merely observes, he can be far less certain that his observation has been exhaustive. The phenomena of nature are so complex and so interdependent that they usually admit of a variety of explanations, and even protracted and careful observation may not afford the crucial instances which would enable the inquirer to reject all the explanations which are unsound. At the same time observation and experiment are not to be regarded as distinct methods. Experiment is but a means of extending the field of observation.

In economic research both observation and experiment are attended with peculiar difficulties. The aid of experiment is rarely available. The close relation between economic phenomena and other elements of human welfare usually forbids the production of economic phenomena at will. Even when an economic experiment is tried, it is usually tried under circumstances which deprive it of most of its scientific value. An employer may introduce an eight hours' day in his works, or a board of guardians may suppress outdoor relief, and the results of either of those experiments may afford valuable information. The change may be made so rapidly as to produce its effect before the conditions, which may be comparatively simple, can be appreciably altered. Yet even in cases such as these we can by no means exclude the action of the plurality of causes. The workman whose day of labour is experimentally shortened may have a peculiarly strong motive to efficiency which might disappear if the reduction of hours had received the sanction of law or custom. The suppression of outdoor relief in one union may give idle and thriftless persons a motive for flitting into other unions. When we pass to innovations of wider scope, we find ourselves still more remote from the conditions of scientific experiment. The effects of an important law or a far-reaching invention are inextricably mingled with the effects of many other causes. That the effects of steam-power or of a policy of free trade have been immense, nobody will deny. But how much of our present economic state is due to the one or the other no one will attempt to describe with absolute accuracy. Many other potent causes have co-operated in producing our modern economic order, and the effects are inextricably blended and interfused. We may say, therefore, that experiments sufficiently accurate to satisfy the standard set by physical inquirers are practically impossible in political economy.

Observation, therefore, is almost the sole means of obtaining the knowledge of facts required by the economist. But observation, as a source of scientific knowledge, labours under two distinct disadvantages, the plurality of causes and the intermixture of effects. The same phenomenon may have been produced in different instances by different combinations of causes. And again the effects of many causes may be intermixed in the one phenomenon. Both of these disadvantages may be experienced in attempting the same economic observation. They may be partially overcome by enlarging the field of observation as widely as possible. But even then the observation which is most fruitful for economics "is in the main not observation of complex economic facts, but of elementary economic forces and the conditions under which they operate. It is by the agency of those forces that complex economic facts are built up" (Keynes, *Scope and Method of Political Economy*, p. 166). Thus little can be done by mere collection of instances towards ascertaining the respective effects of such forces, for example, as free trade and protection. Nor can the "personal error" of the observer be eliminated as in cases where more exact methods of "justifying" observation are possible.

Whether observation is complete or not, it cannot be carried out satisfactorily without the aid of theory, and the theory may require much modification after its first inception. When a theory clashes with a fact it must be modified or abandoned, but a new theory must inevitably take its place. Students of economic history who come into collision with theories derived from the experience of one age, and too hastily applied to explain the facts of another, are apt to forget that theorising is both inevitable and beneficial. Whether they are aware of it or not they are themselves theorists. For economic history involves, over and above the accumulation of facts, some criterion of the importance of those facts, and some scheme for their arrangement which must be supplied by the mind of the historian.

Yet the economist enjoys an advantage in observation which may be turned to good account. A student of human acti n, and himself a human being, "he starts with a knowledge of ultimate causes" (Cairnes, *Logical Method of Political Economy*, p. 75). The student of physical science does not possess this advantage. The man in the street knows why mankind desire riches. But the most profound inquirers took thousands of years to discover the nature of the forces which keep the earth in its orbit. The economist must indeed remember that human nature, whilst almost unchangeable in its primary attributes, is infinitely variable in its secondary manifestations. Inference from his own nature to the nature of other men is dangerous no doubt, but it is very helpful.

The economist may therefore proceed deductively so long as he is careful to test his results by recorded experience. Observation of external facts is rather the corrective than the basis of his studies. On account of this peculiarity of economics, a substitute for experience may, as Cairnes remarks, be found in the construction of hypothetical cases. In political economy hypothesis "is never used as a help towards the discovery of ultimate causes and laws; just as in physical investigation it is never used as a substitute for experiment" (*Logical Method*, p. 84). It is only right to add that we should never forget the abstract character of the results obtained in this manner.

C. M.

OCCUPATIO is the acquisition of ownership by taking possession of a thing belonging to no one, such as a wild animal, a derelict, or thing abandoned by its owner; property of a public enemy, etc. E. A. W.

OCCUPATION. In Roman law the (OCCUPATIO) taking possession of a thing that belonged to nobody with the intention of becoming owner of it gave the occupier the right of ownership. In this way ownership could be acquired over wild animals or derelict property. The doctrine has descended to modern law, and in England has been applied to the capture of wild animals, the appropriation of free natural elements, the collection of substances from the sea or shore, and the severance of articles from trees or from the soil. Probably it would also be applied to the finding of a thing which has been absolutely abandoned by, or has become irrecoverably lost to, its former owner. See Pollock and Wright's *Possession in the Common Law*, Oxford, 1888. In Roman law, however, there was no property in game.

The doctrine was applied to a limited extent in the case of real property. If A were granted an estate for the life of B and A died before B, the first person to occupy the land could retain it until B's death. This was abolished by 29 Car. II. c. 3, § 12; 14 Geo. II. c. 20, § 9; and the 7 Will. IV. and 1 Vict. c. 26, §§ 3, 6. The doctrine has also been applied to support the appropriation of new countries by European states. Discovery followed by occupation was considered to give a good title.

[For an account of the Roman law doctrine, see Hunter's *Roman Law*, London, 1892; and for its application in international law, see Maine's *Ancient Law*, London, 1886, and Phillimore's *Int. Law*, London, 1879-1889.] J. E. C. M.

OCHR-EL-GUERCH. The smallest denomination of the Egyptian currency, as reorganised by the Khedivial decree of the 14th November 1885, is the Ochr-el-Guerch, ten of which are equal to a piastre; while 100 piastres make an Egyptian pound, the standard of value.

Five coins bear the name Ochr-el-Guerch, as follows:

Nickel	5	Ochr-el-Guerch		Bronze	½	Ochr-el-Guerch	
,,	2	,,	,,	,,	¼	,,	,,
,,	1	,,	,,				

F. E. A.

OCTROI. France and (under the name of *dazii interni di consumo*) Italy are now the only countries where *octrois* or taxation of urban consumption play a prominent part in local finance. They began to spread in France during the 14th century, and as they required a royal concession or *octroi*, the kings always stipulated that their treasury should take a share of the proceeds—one half from 1663. Suppressed with all other indirect taxes in 1791, they were re-established for Paris in 1799 under the designation of *octroi municipal et de bienfaisance*, and the provincial municipalities were empowered to do the same by a general law of the following year (*loi de frimaire, An VIII.*); they have been several times the object of general legislation, especially in 1814, 1816, 1871, and 1884. In a general way, *octroi* duties are only allowed on (1) drinks; (2) eatables (wheat, flour, bread, and colonial produce, already liable to customs, excepted); (3) fuel; (4) fodder; (5) building materials, with legally fixed maximum rates graduated and rising with the number of the population. They may not assume the character of a local protectionist tariff, nor of a toll on transit and transports. To prevent contraband, smaller *communes* surrounding a large town may, with the preliminary sanction of government, be made subject to its *octroi*, but all monies levied on their territory must be paid over to them. A new *octroi* can only be established by a statute, and every increase of *octroi* duties must be ratified by the superior authorities. As the state levies taxes on drinks at the entrance of towns, the *octroi* duties on such may not, without its agreement, exceed those exacted by the state. Until 1855, one-tenth of the proceeds was made over to the latter. This forced contribution was then suppressed; since 1881, one-fifth is to be applied to primary education.

Owing to the latitude left within these limits to the 1500 great and small French communes possessing *octrois* in 1894, and representing together one-third of the population of France, owing to the complexity of local financial wants, of ways of perception (about one-half of the *octrois* being farmed or managed by the

state), and also of local consumption (varying, for instance, between wine, cider, and beer), average numbers convey a very inadequate notion of the sums paid per head of urban population, of the proportional cost of collection, etc. Taking the twenty chief towns of France, the cost of collection fluctuates between 5 per cent (Paris) and 14·65 per cent (Bordeaux), the general average being 8·09 per cent. In this respect a considerable improvement has been realised within the last sixty years; formerly the same average oscillated between 20 and 25 per cent. In Paris each inhabitant pays 58 francs (say £2 : 6 : 8) a year, of which 19 francs (15s. 10d.) is on wine, and 13 francs (10s. 10d.) on eatables, whilst for the rest of France the total average is only 13 francs (10s. 10d.); the gross proceeds amount to about £12,000,000 sterling, whereof one half for Paris alone. The staple articles are taxed as follows in Paris:

Wine (per hectoliter=22 gallons) . .	10·62 francs	(8s. 10d.),	yielding in 1890	47 millions of francs	(£1,880,000)
Pure alcohol (contained in spirits, liquors, etc.)	79·80 ,,	(£3 : 6 : 6)	,, ,,	13 ,, ,,	(£520,000)
Butcher's meat (per 100 ks. = 222 lbs.) .	9·73 ,,	(8s. 1d.)	,, ,,	10 ,, ,,	(£400,000)
Butter ,, ,, .	14·40 ,,	(12s.)	,, ,,	2·8 ,, ,,	(£112,000)
Cheese ,, ,, .	11·40 ,,	(9s. 6d.)	,, ,,	1 ,, ,,	(£40,000)
Coals ,, ,, .	0·72 ,,	(7d.)	,, ,,	10 ,, ,,	(£400,000)
Oats ,, ,, .	1·50 ,,	(1s. 3d.)	,, ,,	2·6 ,, ,,	(£104,000)

The *octroi* also collects on wine and alcohol, at their entrance in Paris, a supplementary tax of 8·25 (6s. 10d.) and 186·25 (£7 : 8s.) francs per hectoliter on account of the national revenue, thus burdening the ordinary beverage of the Parisian workman with a total tax equal to the cost of inferior wines when leaving their native vineyards. Objections have often been raised to the principle of an *octroi* duty, and its abolition demanded; but it would be a very arduous reform to carry out under the actual conditions of French finance, general and local. It would no doubt be feasible in smaller places, but in Paris, where it provides more than one half of the ordinary municipal receipts—145 millions of francs (£5,800,000) out of 267 (£10,680,000), —it seems well-nigh impossible to discover an appropriate substitute, and, invoking the plea of necessity, most French financial economists, though admitting that *octrois* are an evil, would endorse Prof. Wagner's dictum, that "its maintenance constitutes the financially least objectionable and relatively even the best system" (*Finanzwissenschaft*, iii. p. 915). Still, even those who do not see their way to a radical suppression, demand a mitigation of the dues on the so-called hygienic drinks (wine, beer, and cider), which, to influence retail prices, would, on account of the duties levied for the state, require an agreement between the state and the municipality. This plan is advocated by M. Paul Leroy Beaulieu (*Économiste Français*, 23rd and 30th April 1892, and 10th February 1894). M. Léon Say is willing to go further than this; he proposed, at a meeting of the *Société d'Économie Politique*, a general redistribution of general and local, direct and indirect taxation (*Journal des Économistes*, December 1891, pp. 449-461).

The most usual objection to *octrois* is that they press heavily on the means of urban consumers, especially of the working classes. This objection is undoubtedly valid in Paris as to the dues on drinks, but even including the latter, M. Paul Leroy Beaulieu comes to the conclusion that a working man only pays in Paris 22 or 23 francs (18s. 4d. or 19s. 2d.) for his yearly share; he, besides, enjoys exemption from the tax of 11 per cent on house rent, since he generally pays for himself and family 300 francs (£12), and all house rents under 500 francs (£20) are exonerated (*Traité des Finances*, i. pp. 735-737). It is not at all certain that this same workman would be appreciably benefited by the suppression of the moderate dues (say 5 per cent) on butcher's meat, butter, and the like articles, the difference between retail and average prices of these articles, when sold by the farmers and rural breeders, being enormous and out of all proportion to the dues. The same difference exists between the price of corn and the price of bread, both of which are free, and their dearness must be ascribed to bad trade organisation. It should also be noticed that, in Belgium, the abolition of *octrois* thirty years since produced no marked influence on the price of victuals, at least in large towns like Brussels, Antwerp, and Ghent. The suppression of low *octroi* duties, and a slight reduction of high duties, such as those on wine, would probably be far more beneficial to tradesmen and dealers than to the lower and middle class consumer; the latter would be much more pinched by an increase of the tax on house rents, an increase often pointed out as the financially most promising substitute. The plan followed in Belgium in 1860—the raising customs and excise duties, and paying over the surplus thus obtained as well as a percentage of the postal revenue to the *communes*,—would bring about the relief of the urban at the partial expense of the far more numerous rural population, which, in the present political state of France, would resent this method of reform. All these considerations render it probable that the total abolition of *octrois* is not to be expected in France unless in a very remote future. Still the municipality of Lyons has this year (1895) voted the principle of the abolition of its *octroi*.

Outside France and Italy taxes on urban consumption exist in a few continental towns,

for instance, in Bavaria, and in the chief towns of Austria, but here the "open country" (*das flache Land*) is also subject to them, although in a lesser degree than the "enclosed towns" (*geschlossene Städte*). For an instance of *Octroi* in Glasgow in the days of Adam Smith, see *Life of Adam Smith*, by John Rae, p. 67.

Besides the already mentioned works and the leading French treatises on finance, see, among recent works, Guignard, *De la Suppression des Octrois.*—Carré, *Suppression des Octrois de la Ville de Paris.*—Saint Julien and Bienaimé, *Histoire des Droits d'Octroi à Paris.*—Lesourd, *Législation des Octrois.*—Yves Guyot, *La Suppression des Octrois* (Report to the Chamber of Deputies, 1889).—Tramuset, *La Réforme de l'Octroi et de l'Impôt des Boissons.*—Cohn, *Finanzwissenschaft*, pp. 647 *et seq.*—Reitzenstein, *Conrad's Jahrbücher*, vols. xlii. and xliii.—Menger, *Zusammenstellungen zur Reform der Verzehrungssteuer* (Vienna, 1887).—Bastable, *Public Finance*, pp. 481-488. The abolition of the Belgian *octrois* led to the publication of an extensive official report, entitled *Abolition des Octrois Communaux en Belgique—Documents et Discussions Parlementaires.* E. Ca.

ODDY, J. Jepson (died 1814), merchant; was a member of the Russia and Turkey or Levant Companies.

He wrote *European Commerce*, etc., London, 1805, 4to, and *A Sketch for the improvement . . . as exemplified by the inland navigation of Europe in general and of England in particular, including details relating to the intended Stamford Junction navigation to unite the Eastern with the Midland and Western counties of England*, London, 1810, 8vo. Oddy unsuccessfully stood for parliament for Stamford.

ODEL TENURE. See Udal Tenure.

OFFICIAL RECEIVER. Under the Bankruptcy Act 1883, certain persons have been appointed by the board of trade "official receivers" of debtors' estates. When a "receiving order" is made for the protection of the debtor's estate, an official receiver thereby becomes receiver of the debtor's property pending the appointment of a trustee.

Under the Companies Winding-up Act 1890, the official receivers have to discharge duties in the winding up of companies similar to those they perform in bankruptcy.

[Robson's *Bankruptcy*, 1894.—Lindley on *Companies*, 1891.] J. E. C. M.

OFFICIAL VALUES. This term was for many years a survival from the earliest attempts to record the value of British imports and exports. The office of inspector-general of imports and exports was constituted in 1697, and about the same time an official tariff was prepared for his guidance in computing the values of goods passing through the customs. This tariff was based on the existing prices of commodities, and, doubtless, for some years very fairly represented actual market values. But as prices changed, the official rate of computation was continually diverging more widely from those actual values. When, towards the close of last century, statisticians came to deal with the figures of trade, it soon became notorious that they did not correspond to facts. Constantly in the closing years of the century the inspector of imports and exports would place separately on record his computation of real values. The first official step towards reform was made in 1798, when the new "convoy duty" (an export duty) was levied on declared value. From that time it was customary to record the exports both according to the official tariff and according to their "real value," as will be seen by the statistical tables from 1800 to 1854. In the latter year, computation according to real value in all customs statistics was inaugurated.

For some time it was argued that though the official values did not represent value, they were a guide to quantities: but the suggestion did not bear examination. The official value remains a statistical curiosity (see also Imports and Exports).

[First *Report* of Customs Commissioners, app. v. 1857.—*Sessional Papers*, vol. iii.—Porter's *Progress of the Nation*, 1847, § 3, ch. ix.—M'Culloch, *Account of British Empire*, pt. iii. ch. v., note.] C. A. H.

OGILVIE, William (1736-1819), after having completed his studies in Glasgow (1760-61) and Edinburgh (1761-62), became travelling tutor to Alexander, 4th Duke of Gordon, with whom he seems to have visited France and Italy; he was from 1762 to 1817 professor of philosophy and humanity at King's College, Aberdeen.

His anonymous tract, *An Essay on the Right of Property in Land with respect to its foundation in the Law of Nature. Its present establishment by the Municipal Laws of Europe, and the regulations by which it might be rendered more beneficial to the lower ranks of Mankind*, London, printed for J. Walter, Charing Cross, 1782, is alluded to in Godwin's *Enquiry concerning Political Justice*, 3rd ed. 1798, bk. viii. ch. iii. p. 459, and ch. ix. p. 515. "All riches," says Godwin, "and especially hereditary riches, are to be considered as the salary of a sinecure office, where the labourer and the manufacturer perform the duties, and the principal spends the income in luxury and idleness." In a footnote he adds: "This idea is to be found in an essay on the right of property in land, published about twelve years ago by an ingenious inhabitant of North Britain, pt. i. § iii. par. 38, 39. The reasonings of this author have sometimes considerable merit, though he has, by no means, gone to the source of the evil." Ogilvie, besides having inspired the father of English communism, may claim the honour to have been among the first advocates of agrarian reform, aiming at "an increase of the number of farmers, by favouring the movement of

day labourers and manufacturers, to the more animating and manly occupation of cultivating a small farm for their own account" (introd.). His theory, indeed, is more far-reaching. Starting from LOCKE's theory of property, he reasons that although "all right of property is founded either in occupancy or labour" (§ 1), "in every country where agriculture has made considerable progress, these two rights are blended together, and that which has its origin in labour is suffered to eclipse the other, founded in occupancy" (§ 8). The natural right to an equal share of the soil being thus in conflict, as in America, with the right to the additional produce of a fertile soil by labour, the problem of agrarian legislation consists in its solution. The present state of land-tenure not only allows the land-holder to monopolise the *original* and *accessory* or *improved*, but also the *contingent* or *improvable* value of the soil (§ 14). This is "a most oppressive privilege, by the operation of which the happiness of mankind has been for ages more invaded and restrained than by all tyranny of the kings, the imposture of priests, and the chicane of lawyers taken together, though these are supposed to be the greatest evils that afflict the societies of human kind" (§ 28); "a monopoly which tends not less to the starving of their fellow-citizens, than a monopoly of bakers without any control or inspection of the magistrate would do. It will not produce its effects very suddenly, indeed, it is only a lingering piecemeal famine, under which the individual languishes, and the race becomes dwarfish, debilitated, and deformed" (§ 33). "What other cause than this pernicious monopoly can be assigned why population has been so long at a stand in Europe, and does not advance with nearly the same rapidity as in America" (§ 34, cp. also § 36). This passage seems to have been adopted by Godwin, and the fact is known to have served as a battle-ground to MALTHUS. Ogilvie certainly first accentuated the well-known sentence of A. SMITH, with whom he sympathises in matters of free trade, concerning the unearned increment (see INCREMENT, THE UNEARNED). "Whoever enjoys any revenue, not proportioned to such industry or exertion of his own, or of his ancestors, is a freebooter, who has found means to cheat or to rob the public, and more especially the indigent of that district in which he lives. But the hereditary revenue of a great landholder is wholly independent of his industry, and secure from every danger that does not threaten the whole state" (§ 39). By the abolition of this monopoly, the poor laws would be rendered superfluous; the tendency of reform in land must consist in uniting "the essential equality of a rude state with the orders, refinements, and accommodations of cultivated ages" (§ 43). Laws limiting the extent of land acquired by individuals could be introduced in new settlements; but the author sets his highest hopes, similar to the PHYSIOCRATS, in absolute monarchs; his ideal is a military and social royalty, as the prototype of which he proposes Frederick the Great (§ 49, 61, 74). For such events he proposes a scheme, "a progressive agrarian law," as he calls it, the principal points of which are the following:—That every citizen aged twenty-one years or upwards may, if not already in possession of land, be entitled to claim from the public a certain portion, not exceeding forty acres, to be assigned him in perpetuity for cultivation and residence; that the claimant shall have right to choose the situation of his allotment on any farm, freehold, or uncultivated common within his own parish; this allotment shall be set apart, and its landmarks fixed by the magistrate, with the aid of an assize, etc.; the ground thus set apart shall be submitted to the cognisance of an assize, or of arbitrators, who shall determine what reserved perpetual rent the claimant must pay to the landlord, etc.; he is obliged to reside upon his farm, has right to transmit it to his heirs, but if he sells to another, who shall not reside upon it, one-tenth part of the price, or the reserved rent, shall belong to the public (§ 51). But if this reform would be made "wholly consonant to natural justice," it should be accentuated by the following provisions: "that lands acquired in this manner shall not be transmitted by will, but according to the established rules of succession to landed property, the original lord of the manor being *ultimus haeres;* no allotment shall be united to another by succession; it shall not be lawful to break down any such allotment in order to divide it among children, until in any county the uncultivated lands are wholly exhausted; persons acquiring such allotments shall be obliged to perform double service in the militia of their country; in every competition that may arise, orphans and those that have served in the army or navy shall be preferred to all others; finally, the acquisitors "shall pay to the lord of the manor certain aids and services of a feudal nature, so regulated as to produce that degree of connection and dependence which may be expedient for preserving order and subordination in the country without danger of giving rise to oppression and abuse" (§ 71).

In order to hasten the development of small farms, Ogilvie advocated a tax imposed on large farms and short leases, a tax on barren lands, and finally a tax on all augmentation of rents, which he seems to consider as an *impôt unique*, but within a sense approaching more to that of Mr. Henry George than of the physiocrats. Ogilvie also proposes the appointment of a special board, in order "to purchase such estates exposed to sale, and to divide them into small farms of a single plough only, to be given off in perpetual property for a full reserved rent" (§ 63). He suggests similar reforms to be introduced in India and Ireland (§ 74). Ogilvie's ideas, although insisting on the injustice of the landholder's monopoly, are rather similar to the aims of modern social politics with its "allotment," "homestead laws," with intended regulation of agrarian succession in Austria and Germany, than on the lines of land nationalisation. Like a modern Christian socialist, he appeals to an "alliance between the church and the plough" (§ 59). This explains as well the grounds of difference between him and Godwin, as the slender recognition of the merits of his little work among his English contemporaries.

The *Essay on the Right of Property in Land*

has been reprinted in 1838, 12mo, and recently edited with biographical notes by Mr. D. C. Macdonald, under the title, *Birthright in Land*, London, 1891. The editor has utterly failed to grasp Ogilvie's importance for economic history, but gives valuable references concerning Ogilvie and his contemporaries amidst much declamatory matter. He quotes: Pryse Lockhart Gordon, *Personal Memoirs*, London, 1830.—Donald Sage, *Memorabilia Domestica*, Wick, 1889.—Fr. Douglas, *A general description of the East Coast of Scotland*, Paisley, 1782.—Jas. Hall, *Travels in Scotland*, 1807.—M'Culloch, *Literature of Political Economy*.—Sir James Mackintosh, *Memoirs*, 1835.

[See M'Culloch's *Literature of Political Economy*, p. 310, for Sir James Mackintosh's unfavourable opinion of Ogilvie.] S. B.

OLIPHANT, CHARLES (19th century), writer to the signet, drew up the *Report on Friendly and Benefit Societies, exhibiting the law of sickness as deduced from Returns by Friendly Societies in different parts of Scotland, to which are subjoined tables showing the rates of contribution necessary for the different allowances, according to the ages of the members at entry, etc.*, issued by a committee of the Highland Society, Edinburgh, 1824, 8vo. The report is noteworthy as being the first serious attempt to work out a scale of contributions from trustworthy statistics. The inquiry was confined to the age and sickness of members, and was not extended to deaths. The tables of the average duration of sickness among persons of various ages were founded on the experience of 73 different benefit societies, belonging to 16 out of the 33 Scotch counties, both Lowland and Highland, and representing 104,218 years of life. The conclusions are to some extent vitiated by the fact that these societies contained many members who had joined from philanthropic motives, and had never made any claim to the benefits. In 1825 Oliphant gave evidence before the Select Committee of the House of Commons, which sat in that year and in 1827, the outcome of whose labours was the Act of 1829, 10 George IV. c. 56 (see FRIENDLY SOCIETIES).

[Baernreither, *English Associations of Working Men*, London, 1889, 8vo, p. 235, mentions the report.] H. E. E.

OLIVARES, DAMIAN DE (beginning of the 17th century). His *Memorial sobre las fábricas de Toledo*, presented to the *junta* or board convoked in 1620 by Philip III., in order to ascertain the causes of the decay of Spanish manufactures, gives statistical information on the quantities produced, wages paid, etc., in the silk and woollen manufactures of Toledo and the country around. An analysis of this *Memorial* was inserted by MARTINEZ DE LA MATA (*q.v.*) in his own *Memoriales* (pp. 22, 24, 34), themselves reprinted in CAMPOMANES' *Apendice á la Educacion Popular* (Madrid, 1775). "The opinion," writes Olivares, "that trade with foreigners ought to go on, must certainly be inspired by the devil, who is anxious to destroy a kingdom which God had preserved so Catholic and so Christian."

[Colmeiro, *Hist. Ec. de España*, p. 335.] E. Ca.

OLUFSEN, OLUF CHRISTIAN (1764 to early 19th century), was appointed in 1815 professor of political economy in the university of Copenhagen.

Olufsen was editor of the Danish *Economic Annals* (1797-1820). He published, in Danish, a *Treatise of Practical State Economy*, 1815, and an *Oversigt af National Industrien i Danemark*, 1819. The latter was translated into German, and published (1820) in Altona. E. Ca.

ONE POUND NOTE. An issue of the pound notes has taken place at various dates and under various circumstances in England and Wales. They still exist and form a large part of the circulation of the issuing banks of Scotland and Ireland, nearly £5,000,000 out of £6,900,000 in the former case, and £2,500,000 out of £6,600,000 in the latter, being below £5, which is practically understood to be £1 notes, in March 1907. In England they never appear to have formed proportionately so large a part of the circulation. The Bank of England was allowed to issue them for the first time by the act of 1797, in which year also the country banks were permitted to do the same. This power, as far as the country banks were concerned, was withdrawn by the act of 1822, and the Bank of England withdrew its notes about the same period. Since that date to the present time no serious proposal has been made, till that of Lord Goschen in 1892, to employ one pound notes in England. Lord Goschen's plan was connected with the desire to increase the gold reserve at the Bank of England. As the arrangement would have increased the fluctuations in the reserve, it does not appear that any great stability could have been looked for. Lord Goschen proposed his plan without apparently having much confidence in it, and the feeling of the business community on its withdrawal was, on the whole, one of satisfaction. The lowest denomination issued by the Bank of France is for 50 francs (£2); the Bank of Germany 20 marks (£1); the Bank of Holland 10 florins (16s. 8d.). These small issues are, we believe, by the desire of their governments. After 1872 the Bank of France issued notes for 20 francs and 25 francs (16s. and 20s.), but withdrew them as rapidly as possible from the fact that they were forged with much facility. In the speech on the bank charter in the House of Commons, 6th May 1844, Sir R. Peel expressed a very strong opinion against the issue of notes for a lower sum than £5, in order to preserve an adequate amount of specie in circulation throughout the country.

i.-vi.—Malachi Malagrowther (Sir Walter Scott) *on the Proposed Change of Currency, etc.*, 1826.—R. H. Inglis Palgrave, *The Bank Acts of 1844-45 and the Bank Rate*, Institute of Bankers, 2nd March 1892.]

ONELY, Rev. Richard (1723-1787), rector of Speldhurst, Kent, author of *An Account of the Care taken in most Civilised Nations for the Relief of the Poor*, London, 1758, 2nd ed., 1772, 8vo. The civilised nations dealt with are the Jewish theocracy, the early Christian church, the Egyptian, Greek, and Roman states. The pamphlet closes with a brief and bald epitome of the English poor laws. H. E. E.

ONEROUS PROPERTY, such as property consisting of land burdened with the payment of rent or other onerous covenants, shares on which there is a liability, unprofitable contract rights, etc., may be disclaimed by a trustee in bankruptcy within three months after his appointment, or within two months of his becoming aware of it. The disclaimer determines the interest of the bankrupt in the property, but does not affect the rights or liabilities of third parties (*see* Mortgagee). Leases may not be disclaimed without the consent of the court, and, as regards any onerous property, the power to disclaim is lost if the trustee, within a certain period of receiving a requisition from an interested party, fails to declare his intention. The damages arising through the operation of a disclaimer (*e.g.* the rent which a lessor loses by the disclaimer of a lease) are proveable as a debt in the bankruptcy.

[Bankruptcy Act, 1883, § 55.] E. S.

ONEROUS UTILITY. See Gratuitous Utility.

OPEN FIELD SYSTEM. See Manor and Three Field System.

OPEN POLICY (Marine Insurance). By a valued policy a valuation is put on the subject matter insured. On the other hand, an open policy does not fix the value of the subject matter insured, but, subject to the limit of the sum insured, leaves the amount payable by the insurer to be ascertained after loss. For the purpose of ascertaining the amount, certain more or less arbitrary rules have been worked out by the judges, who have hesitated between two conflicting principles of indemnity, but in the main have adhered to the principle that the assured ought to be put in the same position as he was in when the adventure commenced, and not in the position which he would have been in had it been carried to a successful termination.

[See Arnould's *Marine Insurance*, ed. 6, p. 67 *et seq.*] M. D. C.

OPERARIUS. A manorial tenant who actually worked for his lord on the land at various kinds of agricultural labour, and had not commuted his services for a money payment (see Manuoperationes). In the *Testa de Nevill*, p. 186, the annual services of a *villanus* are valued at 8½d., but those of a *nativus operarius* at 8s. 4½d. R. H.

OPIUM, as a State Monopoly. Opium, the inspissated juice of the poppy, is produced on a large scale in India, China, and Persia. The opium in common use in Europe for medicinal purposes is as a rule of the so-called Smyrna or Turkey variety, and is obtained mostly from Asia Minor and Persia. That which is produced in India and China is less rich in morphia than the former variety, and is used by many Asiatic races, including the Chinese and the populations of India, as a narcotic and stimulant. It is both eaten and smoked; the latter form of consumption being chiefly, though by no means exclusively, prevalent in China.

Opium is of interest to economists chiefly because, throughout that part of India which is British territory, it is the subject of an extensive state monopoly. This is of considerable antiquity, dating back to a period anterior to the establishment of British rule in India. Under the Mogul empire the trade in opium was an imperial monopoly, and farmed at a quit-rent. Up to the period of the British acquisition of Bengal and Behar, the Dutch were the chief purchasers. Instructions to make opium a part of the investment were first issued by the British East India Company in 1683. During the anarchy which prevailed throughout the decay and fall of the Mogul empire in the middle of the 18th century, the imperial monopoly fell into abeyance; trade was disorganised; cultivation fell off; and the opium produced was so generally adulterated that it yielded very poor prices. Even after the restoration of comparative peace in 1765, disorder continued. At length, in 1773, Warren Hastings, then governor-general of Bengal, assumed on behalf of the East India Company a monopoly of all opium produced in Bengal, Behar, and Orissa, subject to certain concessions secured to the Danes, the Dutch, and the French, which have now either lapsed or been commuted for a money payment.

The rights thus acquired were at first farmed; but in 1797 the direct or "agency" system was introduced, and is still in force. Under this system, as now administered, the cultivation of the poppy plant is generally prohibited throughout British Indian territory. It is permitted, however, in eleven districts of Bengal and twenty-nine districts of the North-Western Provinces under license; the cultivators, who receive periodical advances from government, are bound under penalties to deliver the whole of their crop to the agent at a rate previously fixed. This rate has fluctuated slightly. From 1881-82 to 1893-94 it was Rs.5 per *seer* (1 lb. 14 oz. nearly) of 70° consistence, *i.e.* 70 parts in 100 being pure opium, the remainder being water It is now Rs.6 per *seer*.

The opium delivered to the agents is manufactured at the two state factories, situated at Patna, and at Ghazipur near Benares, into "provision" opium, adapted for export to China, and "excise" opium, for consumption in India. The average cost of a chest (=140¼ lbs.) of provision opium has varied during the last ten years from Rs.412 to Rs.449. The same opium, when sold at the government auction for export to China, has realised average prices ranging from Rs.1037 to Rs.1251 per chest. The excess of the sale price over the cost price may be regarded as the duty which the existence of the state monopoly enables the government to impose. This at present exceeds Rs.800 per chest, *i.e.* is not far short of twice the cost price of the drug.

In most of the native states of India poppy cultivation is prohibited. But in an important group, the majority of which are situated in Central India and Rajputana, a large amount of opium—the so-called Malwa opium—is produced. In these states the British government has no concern with the cultivation, manufacture, or sale; but the native rulers levy a variety of imposts, among which is usually included a special rate of land-tax on land suitable for poppy. This opium is not permitted to enter or pass through British territory, for local consumption or export to China, save under passes granted by a British agent, and on payment of a heavy transit or import duty. The rate of duty has varied from time to time, and is now Rs.650 per chest (=140¼ lbs.) of 90° consistence. This is equivalent to Rs.527 on opium of the consistence of Bengal opium. The British government is enabled to levy this duty by reason of the fact that the opium cannot reach the sea for export to China without passing through British territory.

The propriety of maintaining the Bengal monopoly has been frequently considered by Indian and other authorities. Regarded from an administrative standpoint, the monopoly system is, it is now generally conceded, superior to any that could be substituted for it. In 1864 it was condemned, on purely economic grounds, by Sir Charles Trevelyan, then Indian finance minister, who held that its abolition would be "attended with the same good effects as the throwing open the India and China trade, and the abolition of the Bengal salt monopoly," *i.e.* by a large expansion of the trade. Such a result would not, at the present day, be ordinarily regarded as favouring the abolition of the opium monopoly. Other authorities, including Sir W. Muir, have attacked the monopoly on the ground that it casts upon government "the odium . . . of not only encouraging the growth of the poppy, but of itself being the direct trafficker in the drug and its monopolist." On the other hand, Sir J. P. Grant, a former lieutenant-governor of Bengal, has maintained that "the distinction, *as a question of ethics*, between raising a revenue from opium by an excise on consumption and a duty on exportation, and raising the same revenue by monopolising the manufacture, is fanciful and false." As a measure of finance, the abolition of the monopoly and its replacement by an export duty is easily shown to be disastrous. The state profit on a chest of Bengal opium is over Rs.800, whereas the export duty on a similar chest of Malwa opium is only Rs.527. It follows that if the quantity of opium produced remained the same, there must be an enormous loss of revenue; while if the revenue remained the same, the quantity of opium produced must be very largely increased.

The policy of China in regard to the local production and import of opium has varied from time to time, cultivation and import being alternately prohibited and permitted. It is known that the poppy was extensively cultivated in China, and opium imported from abroad many years before the English became concerned in the trade. It is frequently alleged that the Chinese wars of 1840-42 and 1856-58 were waged in order to compel that country to receive Indian opium. Two of the best authorities, however, Mr. H. N. Lay and Sir Thomas Wade, strenuously deny that this charge has any basis of truth. They affirm that opium was a mere incident of the first war, and had no concern whatever with the second; and that the object of both wars was to compel the Chinese to have political and commercial relations with us. The opium trade became legal after the Treaty of Tientsin (1858). The tariff duty and *likin*, or inland transit duty, are levied together and regulated under the Chefoo Convention (1876).

The Indian opium trade in all its bearings has lately formed the subject of an exhaustive inquiry by a royal commission appointed in 1893. The report states that the evil arising from the use of opium is less than has been represented in England, and that the commissioners have no evidence of extensive moral or physical degradation arising therefrom; that no case has been made out for prohibition, nor could such a measure with justice be extended to the native states; that the Bengal monopoly is the best system for regulating the production of opium in British India; and that the present treaties which govern the admission of opium into China have been deliberately accepted by the Chinese government, and admitted by the latter to contain all that they desire. The finding is, in substance, that unless China should hereafter declare a wish to prohibit import, there are no grounds for interfering either with the export trade, or with the production and local consumption in India.[1]

[1] There still exists, however, in the minds of many persons in England, a strong desire to see the British government in India cease to appear as the manufacturer of an intoxicant; but no corresponding desire has been expressed by them to supply a less objectionable source of revenue to the Indian government, to make up the deficiency.

[Dr. G. Watt, *Dictionary of the Economic Products of India*, London, 1892, vol. vi. pt. i. art. "Opium."—*Report of a Commission appointed by the Government of India to inquire into the Working of the Opium Department in Bengal and the N. W. P.*, Calcutta, 1883.—Mr. H. N. Lay, *Note on the Opium Question: a Brief Account of our Relations with China*, London, 1892.—Hansard's *Parliamentary Debates*, vol. liii. pp. 670-950; vol. cxliv. pp. 1391-1846.—*Correspondence relating to China*, presented to parliament in 1840.—*Final Report of the Royal Commission on Opium*, 1893-95.] E. N. B.

OPTIMISM. The term optimism is difficult to define. Strictly it should signify the belief that everything which exists is the best possible. But as there is scarcely any pessimist who denies absolutely the existence of good, so there is scarcely any optimist who denies absolutely the existence of evil. Optimism therefore can describe only the belief that good greatly preponderates in the world, or that evil admits of being resolved ultimately into good. Such a belief may be the result either of temperament or of a process of logical inference. In so far as it is the result of a happy temperament, it cannot be communicated to those whose disposition is less cheerful. In so far as it is the result of logical inference it may take various forms. All who regard the universe as the work of reason, in other words, all theists, must be optimists in one sense or another. But among theists even within the bounds of the Christian church there may be wide differences in the nature of their optimism. Some may concentrate their minds on the corruption of man and others upon the benevolence of his Creator. St. Augustine or Calvin would hardly be termed optimists in the ordinary use of that word. Paley was an optimist in every sense. Now one of the characteristics of the period in which modern political economy took its rise, the period between the close of the Thirty Years' war and the outbreak of the French Revolution, was a general optimism. Religious wars and persecutions had impressed the most active minds with indifference or disgust for the theological views which came down from the middle ages, and which were permeated with distrust of human nature and aversion to the pursuits of the world. In contrast to these views the antique conception of nature kept alive by the Roman law again attracted philosophers and became the germ of new moral and political theories. Natural religion took the place of revelation, and natural goodness of asceticism. Natural instincts were again regarded as innocent and deserving of gratification. Much stress was laid on those amiable and social instincts which find their fulfilment in promoting the happiness of others. Providence, it was held, had so ordered the world that each man in seeking to satisfy his own desires contributed to the general welfare. Virtue was identified with the rational pursuit of happiness, and thus was made to appear easy and natural. From these first principles the inference in favour of freedom was irresistible. Restraint or compulsion was in itself an evil because it was painful, and in most cases restraint or compulsion was unnecessary, since human instincts harmonised by divine wisdom tended of themselves to bring about the good of mankind.

This form of optimism pervades the discussion of education, of legislation, and of economics by the most celebrated writers of the 18th century. It is very noticeable in the writings of the physiocrats and of Adam Smith. Adam Smith cannot indeed be charged with taking too exalted a view of human nature. He assumes that men are generally employed in promoting their own interests, and he objects to any regulation that can be dispensed with, because he thinks that it is likely to be inspired by selfishness. Adam Smith's optimism lies rather in overrating the ability of the individual to perceive his interest, and in assuming a providential harmony between the self-interest of various individuals if placed in a state of legal freedom and equality. It is only after a prolonged discipline that the ordinary civilised man has attained even to his present imperfect knowledge of what is good for him, and even now the pursuit of his own welfare by each individual constantly brings him into conflict with others.

Since Adam Smith wrote upon morals and economics, optimism has been discouraged by several causes. In the first place, the French Revolution showed that the glorification of natural impulses might end in crimes and disorders as great as had ever been produced by fanaticism. In the next place, the struggle of nation with nation, and of class with class, for the last hundred years, has compelled us to see that there is no pre-established harmony between the appetites of different human beings. In the third place, the rise in the standard of comfort has produced an all but universal discontent. Mankind are probably more comfortable than in any former age, yet the difference between that which they enjoy and that to which they think themselves entitled is more noticeable than ever. Lastly, the progress of science has disturbed the cheery, old-fashioned view of nature. Malthus showed that nature has not provided an abundant subsistence for an indefinite number of persons. Darwin showed the evolution of life to have been a process of almost infinite length involving wholesale waste and destruction. Those who have adopted a formal and philosophical pessimism are few, but those who maintain the easy optimism of the 18th century are fewer. There are many who propose to make mankind

happy by political or economical changes, but as a rule they propose to do this by subjecting the individual to the community. For with the old optimism the old belief in liberty has also declined in strength.

The change in the tone of economic literature may be realised by comparing Smith's *Wealth of Nations* with J. S. Mill's *Principles of Political Economy*. Leslie Stephen, *English Thought in the Eighteenth Century;* Bonar, *Philosophy and Political Economy;* Ritchie, *Natural Law*, may be consulted for information respecting the philosophical optimism of the last century. F. C. M.

OPTIONS. An "option" is the right to conclude a bargain on a future date, at a certain price. A "buying option," called also "the call," is the right to demand a certain number of shares, or amount of stock, or quantity of some specified produce, within a given time, at a fixed price; and a "selling option" is the right to sell, or "put" stock shares or produce under the same conditions. A "put and call" is a right of either buying or selling at a fixed price. Upon this plan speculations may on one side be made with a small capital, and with only a certain limited risk. But the net profits of the speculation are diminished by the price given for the option; and the probability of any profit resulting is really very small, because the price demanded is sure to be large enough to cover all the chances which the dealer can foresee.

Options are chiefly dealt in on the Stock Exchange, but are also frequently used in the United States in transactions in wheat and other produce (see PUT AND CALL). R. W. B.

ORA (Anglo-Saxon). The ora was a money of account introduced into England by the Danes, and does not appear at any time to have been a coin in use in this country.

In the reign of Edward the Elder (901-924), fines imposed upon the English population were reckoned in shillings, while sums due from the Danes were calculated in ora. The Danes used the term to designate both a weight and a cash value. The weight is alluded to in one version of the Laws of Ethelred as one-fifteenth of a pound, and the value is frequently referred to in DOMESDAY BOOK (*q.v.*) as that of twenty shillings. Subsequently, however, record exists of a lower rating of sixteen shillings being also used. The modern Scandinavian ÖRE is doubtless the lineal descendant of this ancient money of account.

[R. Ruding, *Annals of the Coinage of Great Britain*, 1840.] F. E. A.

ORDER (bill or note payable to). At common law a bill or note could not be negotiated by indorsement unless it contained words expressly authorising transfer. But § 8 of the Bills of Exchange Act 1882 has adopted the Scotch rule, and now provides that a bill is payable to order which is expressed to be so payable, or which is expressed to be payable to a particular person, and does not contain words prohibiting transfer, or indicating an intention that it should not be transferable. The result is that if a bill or note is made payable to A. B. it is in legal effect payable to A. B. or his order. The same rule applies to indorsements. M. D. C.

ORDER AND DISPOSITION. The ownership of personal property, as a rule, can be transferred by delivery of possession. Possession of property is therefore evidence of ownership. Where a purchaser or a mortgagee of chattels permits them to remain in the possession of the vendor or mortgagor, the latter appears to the world at large as owner, and is therefore able to obtain credit as such. In order to protect creditors, successive bankruptcy acts have made all goods that are in the "possession, order, and disposition" of a bankrupt, in his trade or business, by permission of the owner, and of which the bankrupt is the reputed owner, liable for payment of his debts, even though such goods belong to some one else.

[Robson on *Bankruptcy*, 1894.] J. E. C. M.

ORDERS IN COUNCIL (retaliatory against France). The battle of Trafalgar (21st October 1805) annihilated the French fleet, put an end to all schemes for an invasion of England, and secured English supremacy at sea for the remainder of the war. Soon afterwards the battle of Austerlitz (2nd December 1805) broke up the great coalition which Pitt had formed, and gave to France an ascendency in Europe such as no power had obtained for centuries. From this time the two great belligerents, England and France, unable to strike each other directly, were forced to resort to the destruction of each other's commerce, and began a struggle limited only by their respective powers of endurance. The peculiar difficulty of this warfare against commerce, which now became the main object of both states, lay in the injury which it must necessarily inflict upon neutral powers, whose interests in time of war are always opposed to those of belligerents. Both in 1780 and in 1800 the Baltic states had shown their hostility to any infringement of their trading rights by forming an ARMED NEUTRALITY (*q.v.*). And there was now another neutral power to be reckoned with. The United States had become independent in 1783; since the outbreak of the war they had developed a considerable mercantile marine, and their geographical position gave them peculiar advantages for carrying on trade between the West Indies and Europe. The attitude of the United States becomes a factor of first-rate importance in the relations between England and France after 1805.

England took the first step when the Grenville ministry, which had been formed on Pitt's death, issued an order in council on 16th May 1806. This decreed a general blockade

of the whole coast from the Elbe to Brest, and a rigorous blockade from Ostend to the Seine. No neutral vessels could enter a port on the latter coast, and outside the narrower limits they were only admitted provided they "had not been laden at any port belonging to his Majesty's enemies." This order, which was not for the time an excessive straining of the maritime ascendency of England, gave Napoleon a pretext for issuing the famous Berlin decree (21st November 1806), which laid the foundation of what is known as the CONTINENTAL SYSTEM (*q.v.*). By this he declared the British Islands to be in a state of blockade, prohibited all trade with them, and decreed that all goods exported from them were lawful prize. This decree, which France would have found it extremely difficult to enforce, provoked the whig ministers to draw up the first of the great orders in council, which was issued on 7th January 1807. This document, which was condemned by the opposition as a very inadequate measure of retaliation, ordered "that no vessel shall be permitted to trade from one port to another, both which ports shall belong to or be in the possession of France or her allies, or shall be so far under their control as that British vessels may not freely trade thereat." This prohibition of the coasting trade went beyond any previous claim of England, which had hitherto aimed mainly at preventing the carriage of goods from French colonies to the mother country. It was bitterly resented by the Americans, who had discovered a lucrative business along the Mediterranean coasts from which they were suddenly excluded under penalty of capture and confiscation.

In March 1807 the Grenville ministry was driven from office and their places were filled by tories, who were more resolutely anti-French and less scrupulous in the choice of expedients. Soon afterwards Napoleon ended the northern war by the treaty of Tilsit (8th July 1807), by the secret articles of which France and Russia pledged themselves to effect the complete exclusion of England from trade with Europe. Napoleon now returned to Paris, and devoted all his energies to the carrying out of his continental system, which he had been compelled to neglect during the campaigns of Eylau and Friedland. Denmark, Portugal, Prussia, Austria, and Turkey were all coerced or induced to prohibit the entrance not only of English vessels but of all English products. French ships were instructed to seize the vessels of any power if they carried any goods of British origin, and French courts were instructed to declare the cargoes of such vessels to be lawful prize.

These vigorous measures gave the tories a pretext for that energetic retaliation which they had demanded when in opposition. On 11th November 1807 they issued another order in council which asserted that the "order of 7th January has not answered the desired purpose, either of compelling the enemy to recall his orders or of inducing neutral nations to interfere with effect to obtain their revocation, but, on the contrary, the same have recently been enforced with extreme rigour." The main provision of the order is that "all the ports and places of France and her allies, or of any country at war with his Majesty, and all other ports or places from which, although not at war with his Majesty, the British flag is excluded, and all ports or places in the colonies belonging to his Majesty's enemies, shall from henceforth be subject to the same restrictions in point of trade and navigation as if the same were actually blockaded by his Majesty's naval forces in the most strict and rigorous manner." Further "all trade in articles which are of the produce or manufacture of the said countries or colonies shall be deemed and condemned to be unlawful, and every vessel trading from or to the said countries or colonies, together with all goods or merchandise on board, and all articles of the produce or manufacture of the said countries or colonies, shall be captured and condemned as prize to the captors." This is obviously the direct and complete reply to the Berlin decree, and though the scope of the English prohibition is the more vast and comprehensive in proportion to the magnitude and number of her enemies, yet this difference was by no means out of proportion to the differing naval power of the two countries. The French men-of-war were closely confined to their harbours, so that the blockade of the British islands was purely verbal. England, on the other hand, though of course unable to enforce a blockade on the scale of the order, had such an overwhelming naval force at sea as to make the prohibited trade extremely difficult and dangerous.

To the sweeping prohibitions of its main clause, the order of 11th November made two important exceptions in favour of *bona fide* neutrals: (1) they might trade to or from the colonies of hostile powers provided their port of departure or destination was in their own country or in a British colony: (2) they might clear out from some British port, or from Gibraltar or Malta, or from the port of an allied state, to any hostile port, or back from such port to a British or allied port, so long as the hostile port were not actually blockaded by the fleet. In these exceptions, and especially in the second, lies the subtlety of the English policy of retaliation. Napoleon had prohibited the exportation of goods from the British Islands; the English government replied that France and her allies should not receive any goods whatever except from the British islands, and no goods were to leave France unless in the first place they went to Britain. Thus

not only was France to be weakened and humiliated, but all her imports and exports were to pay toll to the enemy, who would use the wealth thus obtained in strengthening her own forces and in subsidising the continental enemies of France. Napoleon was not slow to reply to a measure which was as insulting as it was damaging to his subjects and allies. On 17th December 1807 the Milan decree declared that every ship which suffered the search of an English vessel, or submitted to a voyage to England, or paid any tax to the English government, was by that act denationalised and deprived of the guarantee of her flag. Any ship, whatever its nationality or its cargo, was declared to be lawful prize if it was on its way to or from Britain, British colonies, or places occupied by British troops.

By these measures the two belligerents stood committed to a struggle for life or death, and also to a policy which imposed greater loss and restrictions upon neutral powers than the latter had undergone in any previous war. For Europe this was a small matter, as Napoleon would not allow any neutrals within reach of his military forces. The United States were the chief sufferers ; and they hastened to retaliate by closing their market to both the belligerent powers, and by depriving both of the benefit of American goods and carriers. An act of embargo (22nd December 1807) forbade American vessels to leave their ports except for another port in their own country. When this was repealed on 1st March 1809, it was succeeded by a non-intercourse act which prohibited all trade with Great Britain, France, and their respective colonies.

The policy and the morality both of the French decrees and of the English orders were hotly debated at the time, and have been a subject of much subsequent discussion. As regards morals, the measures were essentially military in character, and can be justified only on the grounds of advantage or necessity. From the point of view of policy, there can be little doubt that Napoleon's conduct was ill-considered and reckless, and the result justified England in imposing temporary hardship on herself, and in incurring the hostility of neutral states, in order to secure an ultimate victory. France, absolutely unable to defend her own shipping, was really dependent for important supplies upon neutral carriers, and ought to have done all in her power to aid and encourage them. Moreover the hardships imposed upon Europe by the exclusion of necessaries, or by the enormous increase of their price, raised a spirit of resistance to French domination, as an intolerable burden, which even Napoleon could not quell. The necessity of forcing reluctant subjects and allies to carry out measures which he deemed necessary for the destruction of his inveterate opponent compelled him to undertake those enterprises in the Peninsula and in Russia which first sapped and then overthrew his power.

One of the most curious features of the great struggle, which began in 1807 and practically ended in 1812, was that neither state could afford strictly to enforce its own decrees. England was determined to force its manufactures upon Europe in spite of Napoleon, and was aided in doing this by the reluctance of the northern states to obey the orders received from Paris. To facilitate the vast smuggling trade which went on on the coasts of the Baltic and North Sea, England resorted to a system of licenses by which merchants were allowed to carry on trade prohibited by the orders without running the risk of capture by English cruisers. From 2006 in 1807 these licenses increased to over 15,000 in 1809 and over 18,000 in 1810. Napoleon, on his side, found it impossible to dispense with the supplies which his decrees prohibited, and large sums were made by the French government by selling licenses. During the war with Austria in 1809 the evasion of the continental system was so general that its results were mainly seen in the height of prices and the heavy charges for marine insurance. England was so much the gainer by this relaxation that she endeavoured to conciliate the United States by a third order in council (26th April 1809), which narrowed the general blockade ordered in November 1807 to the coasts of Holland, France, and the Italian kingdom of Napoleon.

After his victory at Wagram (6th July 1809), and the conclusion of peace with Austria, Napoleon returned to France determined to draw tighter than ever the restrictions which the recent war had allowed to slacken. If he was powerless at sea, he was absolute on land, and instead of sending his veteran troops to Spain, where they might have ended the war, he employed them as a gigantic coast-guard along the northern and western coasts of Europe. As Holland had proved recalcitrant under his brother Louis, the latter was deposed and his kingdom annexed to the French empire. Other annexations, including the duchy of Oldenburg, followed, until the cordon of troops was complete from France to Russia. When all preparations were made, Napoleon issued a decree of Fontainebleau (19th October 1810), by which all English merchandise in the countries dominated by France was to be taken and burnt. This edict was ruthlessly carried out by the French soldiery.

Now for the first time England felt the full strain of the continental system. Licenses became useless when the exported goods were liable to prompt seizure and destruction ; and their number fell from 18,000 in 1810 to 7500 in 1811. It was calculated that "60,000 tons of coffee lay in the London warehouses, unsaleable at sixpence the pound, while the price or

the continent was from four to five shillings, and in some places even seven shillings." The closure of the American market and a series of bad seasons made matters worse, and the general depression resulted in the bankruptcy of many firms. The orders in council, which had been popular at first, were now objects of general detestation. The opposition denounced them in parliament, the great towns petitioned for their repeal, and the United States threatened war. The government could hardly hold out for long against the general clamour. Fortunately the strain was relaxed at the moment when it seemed to have reached the stage of cracking. The sufferings of France had been even greater than those of England, and she had far less capacity of endurance. The resources of credit taxation and conscription were alike exhausted by the demands which the emperor had made upon them. At this moment the chief French ally found it necessary to make a change of front. Russia was peculiarly dependent upon the English market for its produce, and Alexander I. refused to bring material ruin on his subjects as well as to endure the personal slights put upon him by Napoleon. In December 1810 he struck the first blow at the agreement of Tilsit by allowing neutrals to import to Russia a number of articles of British manufacture. In 1811 Russia abandoned the French system altogether, and entered into negotiations with England and Sweden. Napoleon had no alternative but to acknowledge defeat or to compel submission to his will. He chose the latter alternative, and in 1812 he started on that eastern campaign which led directly to his downfall. In the same year Wellington began the brilliant series of aggressive campaigns which ended in the expulsion of the French from the Peninsula. The warfare against commerce had ended in the defeat of France, and the orders in council had done their work. On 23rd June 1812 the orders of 1807 and 1809 were formally repealed. Unfortunately the repeal came too late to avoid a rupture with the United States, which had declared war against England on 18th June.

[See articles on CONTINENTAL SYSTEM; LICENSES (Continental War), and authorities there referred to. For fullest and best account of the warfare against commerce see Mahan, *The influence of Sea Power upon the French Revolution and Empire* (1892), vol. ii. chs. 17 and 18. It is noteworthy that Captain Mahan, though an American, approves on the whole of the policy of the orders in council.] R. L.

ÖRE. By the provisions of the Scandinavian monetary convention of 1872 the standard of value in Sweden, Norway, and Denmark, the CROWN (*q.v.*), value 1s. 1·215d., is divided into 100 öre.

Token silver coins of fifty, forty, twenty-five, and ten öre are in circulation. F. E. A.

ORESME, NICHOLAS (c. 1320-1382), the author of a treatise on the currency, was one of the most distinguished of the French scholars of the 14th century. In 1356 he became grand master of the College of Navarre at Paris; in 1361 he was elected dean of the church of Rouen; and in 1377 he was appointed Bishop of Lisieux. Without deserving a place in the line of great schoolmen, he was a man of interests as wide as the science of the time, and wrote upon many subjects with facility and force. In 1363 he preached before pope Urban V. at Avignon a vigorous sermon, on the evils in the church, which was in great repute towards the end of the middle ages, and was several times reprinted during the reformation. In 1370 he translated the *Ethics* of Aristotle from Latin into French at the request of Charles V., and was appointed in recompense one of the royal chaplains; and in 1371, at the same prompting, he translated the *Politics* and *Economics*. One at least of his theological works enjoyed a high reputation in the schools of Paris; and his numerous writings on mathematics deserve recognition in the history of that science. The date of the composition of his *Tractatus de Origine, Natura, Jure, et Mutationibus Monetarum* is unknown, but it was probably toward the middle or end of the reign of John II. (1350-1364); the translation into French, which was made by Oresme himself, appears from internal evidence to have been made after 1356.

[The data for the life of Oresme have been carefully gathered by F. Meunier, *Essai sur la vie et les ouvrages de Nicole Oresme* (Paris, 1857), where will be found a list both of his undoubted and dubious works with some illustrative excerpts. Meunier shows that there is no evidence for the assertion, in itself difficult to reconcile with chronology, that Oresme was the preceptor of Charles V. of France. For his mathematical writings, see M. Curtze, *Die math. Schriften des Nicolaus Oresmius* (Berlin, 1870).

His *Tractatus de Origine, etc., Monetarum* occupies some thirty octavo pages. It is composed of twenty-six brief chapters and a prologue. In the prologue he states that some are of opinion that the prince has a right to change the currency at pleasure, and make profit thereby. His intention, accordingly, is to set down what seems to him most necessary to be said *according to the philosophy of Aristotle;* and his hope is to bring about a common agreement. He begins by explaining the invention of money (ch. i.); the use for that purpose of the precious metals (ch. ii.); the use of more than one metal and of alloy for the smaller values (ch. iii.); and the necessity for a stamp (ch. iv.). Since money is instituted for the good of the community, it ought to be coined by "a public person"; and as the prince is "a person more public" than any other individual, he alone ought to undertake the work (ch. v.). This, however, does not make the prince "the lord or proprietor of the currency" (ch. vi.).

The expense of coinage is best met by a proper seigniorage (ch. vii.). The discussion of the main theme then opens with the general proposition that laws or customs affecting the community, including therein the currency, are never to be changed without evident necessity; and this is especially the case with money, on account of the common practice of fixed rents, etc. (ch. viii.). An alteration of the stamp may be sometimes desirable (ch. ix.), and also of the ratio of exchange between the metals, when any notable change takes place in their relative value as commodities ("Verumtamen ista proportio debet sequi naturalem habitudinem auri ad argentum in pretiositate": ch. x.). A change in the denomination of coins is only justified on such exceedingly rare occasions as not to be worth considering (ch. xi.). A change in the weight without a change of denomination is absolutely wrong and fraudulent (ch. xii.); and the same is true of a debasement of the material (c. xiii.); in both these ways the prince unduly draws to himself the substance of his people. The gain to the prince from the alteration of the currency is unjust (ch. xv.), unnatural (ch. xvi.), worse than usury (ch. xvii.), and such evils are of their very nature intolerable (ch. xviii.). Debasement of the currency involves much dishonourable embarrassment to the prince (ch. xix.); impoverishes the subjects, leads to the withdrawal of the precious metals from the country, and disturbs trade (ch. xx.); it benefits chiefly those who follow base occupations, such as money-dealers; and in divers ways it demoralises the people (ch. xxi.). It might seem that as the currency belongs to the community, the community has a right to raise money by an alteration of the currency, especially as such a method satisfied "quasi omnes bonas conditiones requisitas in aliqua tallia" (which are much the same as Adam Smith's canons of taxation). But unless the need of money is very great and the sum raised is to be expended in a far country, so many evils will follow therefrom that to do so will be an abuse of power (ch. xxii.). The prince cannot plead necessity or the grant of the community; the necessity of the community itself should decide, and the community cannot transfer its rights (ch. xxiii. xxiv.). A tyrant cannot long endure (ch. xxv.); and to make gain from a debasement of the currency is prejudicial to the royal power itself (ch. xxvi.).

The reputation of Oresme among modern economists is chiefly due to the enthusiastic praise of W. Roscher in his paper "Un grand économiste français du xiv. siècle" in *Comptes Rendus de l'Acad. des Sc. morales et politiques* (1862). This led L. WOLOWSKI to bring out an edition of the treatise in both its Latin and French forms, with an introduction, in 1864. Ten years later ROSCHER described Oresme as "the greatest economist among the scholastic writers, for two reasons: first, the truth of his views, and secondly, his freedom from pseudo-theological system and pseudo-philosophical argumentation" (*Gesch. der N. O.*, p. 25). Professor Cunningham has more recently spoken of Oresme as the earliest economic writer to explicitly adopt national wealth and national power as the very basis of his argument (*Growth of English Industry and Commerce*, i. (1890), 322), and has reprinted the *Tractatus* as an appendix to his history.

On the other hand, as early as 1863 W. Endemann (*Die nationalökonomischen Grundsätze der canonistischen Lehre*, 1863, in HILDEBRAND'S *Jahrbücher*, i., and separate; n. 331) declared that Roscher's "discovery" only showed how ignorant economists were of the older juristic literature; that the tractate was neither a "source" for later times, nor anything wonderful for its own; and that the ideas were not at all original, but taken from Azo and Accursius and the glossators. In his *Studien in der romanisch-kanonistischen Wirthschafts- und Rechtslehre*, ii. pp. 164-189, (1883), Endemann returns to the charge, and asserts that Oresme's ideas were essentially the same as those of Aquinas and many who followed him, and that there is no reason whatever to regard him as an economic writer of the first rank.

It were unwise to attempt a final judgment until the literature of the 14th century has been more carefully examined. It seems, however, clear that Oresme's general ideas were common to the theologians, canonists, or legists of his time; it is probable also that the special feature of his argument, the insistence upon the right of the *community* to control the currency, was common to him with other representatives of the constitutionalist party in France. The currency had been again and again debased during the century; the states-general had repeatedly protested against such measures, and demanded that the currency should be restored to purity, *e.g.* in the *Grande Ordonnance* of 1357. These considerations need not, however, prevent our recognising the vigour and (on the whole) the clearness of Oresme's tractate, and the courage which was probably required for so unmistakable a declaration. It is not impossible that the treatise was itself composed during the constitutional agitation of the years 1355-1357: Oresme was then residing at Paris, where the states-general assembled; and we know that on the general subject of taxation he agreed with the constitutional party. If this be so, Oresme's place is not in the history of the theory of currency, but in the history of the theory of constitutional government.] W. J. A.

ORGANISATION OF INDUSTRY. See INDUSTRY, ORGANISATION OF.

ORTES, GIAMMARIA (1713-1790), a Venetian monk, left his cloister on the entreaties of his mother after his father's death, but remained in holy orders and was ever a strenuous defender of the clergy. It is with this purpose that he wrote his *Errori popolari intorno all' Economia nazionale*, his *Lettere sulla Religione* and his treatise *Dei Fide-commessi a famiglie e a chiese*, with the scope of upholding the existence of clerical property in mortmain.

In his *Economia Nazionale* (vols. xxi. xxii. and xxiii. of Custodi's *Scrittori classici italiani di Economia Politica*, Milan, 1802-1816) Ortes endeavours to demonstrate that as "the wealth of a nation is determined by the (previous) wants of its members, the riches of one of them

cannot increase unless at the expense of another one; the bulk of existing riches is in each nation measured by its wants, and cannot by any means whatever exceed this measure" (*Discorso Preliminare*). From this rather startling proposition, Ortes, who certainly was an original thinker, deduces the condemnation of the principles on which mercantilism was based. "Money is only a sign of wealth, and must never be considered as being wealth itself. The error of those who mistake money for wealth, proceeds from a confusion between the equivalent of a thing and the thing itself, or between two equivalents which they consider as identical things, although they are not" (ch. ix.).

In his *Riflessioni sulla Popolazione* (Venice, 1790, and vol. xxiv. of Custodi) Ortes controverts the prevailing opinion that an increase of population must necessarily increase the wealth of a nation, and maintains that "in any nation whatever the population is compelled to keep within fixed limits, which are invariably determined by the necessity of providing for its subsistence" (*Prefazione*). In his very first chapter he asserts that, if natural instincts were allowed full play, population would increase in a *geometrical* progression (doubling every 30 years), and calculates that a group of 7 persons composed of three old people, two young men and two young women of 20, would be the ancestors at the end of

150	years of	224	living persons
300	,,	7,168	,,
450	,,	229,376	,,
900	,,	7,516,192,768	,,

Sheer violence keeps down the numbers of animals within the necessary limits, but among men, "generation is limited by reason" (ch. iii.), especially by voluntary celibacy, which affords Ortes an occasion of extolling the provident discipline of the Roman Catholic church. Ortes is a harbinger of MALTHUS; first by his law of the geometrical increase of population, and secondly by the influence which he ascribes to human reason as a prudential check against over-population.

Ortes was a fervent mathematical student, and expresses himself in algebraical formulæ in his *Calcolo sopra il Valore delle Opinioni umane* (vol. xxiv. Custodi). In the same work he illustrates his meaning by curves, which, if not actually traced, are at least minutely described.

[See also Lampertico's monograph of *Giammaria Ortes e la Scienza Economica al suo tempo*, 1865. A very complete analysis of his writings in Professor Errera's *Storia dell' Econ. Pol. nella Repubblica Veneta* (Venice, 1877, pp. 92-156), and especially for his decided views in favour of free trade, Gobbi, *La Concorrenza Estera e gli antichi Economisti Italiani* (Milan, 1884), pp. 197-202.] E. Ca.

Ortes is undoubtedly the most eminent of the Venetian economists of the last century; his genius—original and sometimes paradoxical, is often opposed to the general tendency of the ideas of his time, and though his researches are occasionally faulty in their method, he has left a deep impress on the history of economic theory. He regards economic laws as immutable, like those of nature; he maintains this in opposition to the opinion usually accepted in his time, which regarded economics only in relation to special interests. Perhaps it is this idea which leads him to distrust the action of the state, considering it not adapted to promote the wealth of a country.

While Ortes applied a mathematical method to economics, his arguments are based throughout on abstract theory, disregarding the study both of facts and of history as not appertaining to economic science. This detracts from the value of his labours. Still his works are of weight in the history of economic theory. He did not adopt the doctrines of the PHYSIOCRATS, and he also recognises the importance of division of labour, and the important place taken by production in economic theory. Contrary to the prevailing ideas of his day, Ortes upholds universal free exchange.

ORTHODOX ECONOMISTS. A title sometimes applied to those writers known as the CLASSICAL ECONOMISTS (*q.v.*). This description appears preferable. Orthodox is a term suggestive of controversy, and of the existence of an ascertained norm — a frame of mind uncongenial with that calm spirit in which economic questions should be approached.

ORTIZ, JOSÉ ALONSO (second half of the 18th century), published in 1794 a Spanish translation (with notes) of Adam Smith's *Essay on the Wealth of Nations*, under the title of *Investigacion de la Naturaleza y Causas de la Riqueza de las Naciones* (Valladolid, 4 vols.). Two years later he printed an essay on paper money and public credit (*Ensayo económico sobre el sistema de la moneda papel y sobre el crédito público*, Madrid, 1796), in which, according to Colmeiro's *Bibl. de Economistas Españoles*, he follows closely the theories of Smith. E. Ca.

ORTIZ, LUIS (second half of the 16th century), accountant (*contador*) of Castile, published in 1558 a *Memorial al Rey para que no salgan dineros de estos reinos de España* (Memorial to the King to prevent the export of Money from the Kingdom). Although Ortiz is imbued with the notions of his times on the usefulness of the craft organisations and sumptuary laws, the extraction of precious metals, etc., he is praised by Don Manuel Colmeiro (*Bibl. de los Econ. Españ.*) for his temperate views, rather favourable to protection than to absolute prohibition, and for his practical insight into the causes of the Spanish decay during this period. E. Ca.

OSCAR I. (1799-1859), king of Sweden, a son of Bernadotte, endeavoured to bring the system of criminal law of his country into accordance with modern ideas.

With this object he wrote, on the punishment of criminals, a book published in German under the title of *Ueber Strafe und Strafanstalten.*

[*Dictionnaire de l'Économie Politique*, Paris, 1864.]

OUNCE (Coin). The money of account of Morocco is the ounce.

The following is a list of the coins in circulation in that country:

Denomination.	Weight. Grains.	Fineness.	Value at 5s. 6d. per ounce.
Silver—Ten ounces	285·80	900	5s. 0d.
Five ounces	192·90	835	2s. 4d.
Two-and-half ounces	96·45	835	1s. 2d.
Ounce	38·58	835	5½d.
Half-ounce	19·29	835	2¾d.

F. E. A.

OUT-DOOR RELIEF. See Poor Law.

OUTLAW. If a person formally charged with an offence by an indictment is not in custody and cannot be found, he may be outlawed, *i.e.* put out of the protection of the law. The practical results are that he becomes incapable of taking the benefit of the law, and his property is forfeited to the crown. In England outlawry was abolished in civil cases by 42 & 43 Vict. c. 59, and has fallen into disuse in criminal cases, but in Scotland the absence of the prisoner on the day on which he is summoned to appear and stand his trial is always followed by sentence of outlawry.

[Stephen's *Commentaries*, bk. vi. c. xv. As regards outlawry in Scotland, see Bell's *Digest of the Law of Scotland*, Edinburgh, 1890.] J. E. C. M.

OUVRARD, G. J. (1770-1846), a Napoleon in the field of finance, started his fortune in 1789 by anticipating the demand for paper that would follow the enactment of the freedom of the press. He further amassed great wealth by contracts for provisioning the French armies, and on one occasion we find him making a treaty with the king of Spain as though a sovereign power. He quarrelled successively with the government of Napoleon and that of the Restoration, and was imprisoned at least four times. Neither Napoleon, however, nor the Restoration government could dispense with his help. He wrote in prison three volumes of memoirs, *Mémoires de G. J. Ouvrard sur sa vie et ses diverses opérations financières*, Paris, 1827, 8vo. He was a severe critic of Napoleon's system of leaving to the invaded country the finding food for his armies, and offered an elaborate plan of his own before the Russian campaign. In addition to these memoirs, he was the author of various financial pamphlets. He severely criticised Napoleon's neglect of credit, and was a fervent believer in the expediency of national debts, when safeguarded by sinking funds.

[See his memoirs as above, and *Dictionnaire de l'économie politique*, Paris, 1858.] H. E. E.

OVER-PRODUCTION has been supposed to exist both with respect to consumable commodities and capital. But "the theory of general over-production is an absurdity" (J. S. Mill), in the obvious sense which would justify the recommendation to increase unproductive consumption or to diminish saving.

There are, however, some phenomena which partially resemble the description which is given of over-production. For instance, in a commercial crisis, when there is a deficiency of ready money, there seems to be a plethora of goods; as J. S. Mill has pointed out (Essay 2, *Some Unsettled Questions*). A similar appearance, as he observed, may be produced by a derangement of currency; and it may be added by an appreciation of money consequent upon a great increase in production. Those who suffer from having to meet fixed charges with shrinking incomes are apt to complain of over-production. In general, improvement in production, when accompanied with "sudden changes in the channels of trade" (Ricardo), causes loss to some classes of producers. Workmen may be displaced by machinery (Ricardo, *Pol. Econ.*, ch. xxxi., Mill, *Pol. Econ.*, I. ch. vi. § 2); the native workman by the foreigner (Sidgwick, *Pol. Econ.*, III. ch. v. § 4). These phenomena, if they occurred on a large scale, might present the appearance of general over-production.

The impossibility of a "general glut" has been demonstrated by almost all the authoritative writers of this century; with particular clearness by J. Mill, J. B. Say, and J. S. Mill. On the other side are the weighty names of Malthus, Chalmers, and Sismondi; followed by a crowd of inferior writers. Some edification is no doubt to be derived from examining these writings, and in Mill's phrase (Essays, *loc. cit.*), "seeing that no scattered particles of important truth are buried and lost in the ruins of exploded error."

OVERSEERS (OF THE POOR). A parochial office created in 1601 by the poor law of Elizabeth (43 Eliz. c. 2). Under that act the parish was made the area for poor relief, and the overseers of the poor were to act along with the church-wardens in the administration. They were to be from two to four in number, and to be appointed by the justices of the peace. Later acts gave power to appoint a single overseer in small places. Where there were no church-wardens the overseers acted by themselves. They were to be good and substantial householders. Women were eligible. If there was no inhabitant fit for the office, an inhabitant of a neighbouring parish might be appointed with his consent and at a salary. Vestries had power to elect a paid assistant overseer. So long as the administration of poor relief was parochial, the office of overseer was highly important. Since the passing of the new poor law of 1834 the overseers have little to do beyond levying the poor rate and making out the lists of persons liable to serve on juries or entitled to the parliamentary or municipal franchise. For the changes affecting overseers in rural parishes made by the Local Government Act 1894, see PARISH.

OVERSTONE, LORD. See LOYD, S. J.

OVERT-MARKET. See MARKET OVERT.

OWEN, ROBERT (1771-1858), was born at Newton, Montgomeryshire. His father was saddler, ironmonger, and post-master. Between 1781 and 1790 he was assistant to an old-fashioned Stamford ex-pedlar and linen-draper, M'Guffog; then to Messrs. Flint and Palmer of Ludgate Hill, shopkeepers of the new school, who often worked their employees from 8 A.M. to 2 A.M. Next we find him in Manchester earning £40 a year, at Satterfield's; then setting up for himself without capital, without knowledge of machinery, with an equally inexperienced and indigent partner, in the business of making spinning mules. In 1790 he became manager to Drinkwater, one of the earliest cotton-mill owners at Manchester, with £300 a year, a prospect of partnership, and 500 men under him. In this capacity, he was the first person to spin North American cotton on rollers (1791). In 1794 or 1795 he threw up Drinkwater's employment, and started the Chorlton cotton twist factory. While on a commercial visit to Glasgow in connection with this business, he met Miss Dale, daughter of Dr. Dale, proprietor of New Lanark. She told him that New Lanark was for sale; he went to her father, and bought it at £60,000 for himself and his partners (1797). In the same year he married Miss Dale. It was not until 1st January 1800 that he "entered on the government" (that was his phrase) of New Lanark. The description of New Lanark during Mr. Dale's régime (1784-1800) is derived from Robert Owen's autobiography (1857), his *New View of Society* (bk. i. ii., 1813), and Dr. Macnab, who, in 1819, examined and confirmed Robert Owen's statements in his report to the Duke of Kent. This description was subjected to the most searching criticism at the time by streams of visitors, including the future Emperor Nicholas, Lord Stowell, and others; and was never doubted until Mr. Packard, in 1866, published in his life of Owen an anonymous letter saying that, in 1796, the children were never overworked, that there was no crime and no punishment.

Robert Owen's and Macnab's accounts are as follows:—In 1784, Dale set up one spinning-mill near the Falls of the Clyde. In 1786 work began. He could not get any one to come and work; so he imported 500 workhouse or charity children, whom he fed, clothed, and educated. He took them at six or seven years of age, and worked them from 6 A.M. to 7 P.M.; so that education (say for half-an-hour), began after 7 P.M. Many children, after seven or eight years of apprenticeship, ran away. Further, he got some grown-up people together and built a village of one-roomed cottages with dunghills in front of each (see *Rob. Owen, by a Former Teacher*, 1839). These grown-up people turned out to be thieves, drunkards, and criminals of every sort, as respectable people would not take to manufacture. In 1797 there were four mills at work, and about 700 children and 1000 adults employed; and Mr. Dale, who presided over a bank at Glasgow, over forty

chapels, and over cotton-manufactures all over Scotland, used to spend a few hours every three months, but no more, in New Lanark.

The plan upon which Owen worked was twofold:

First, as to the children. He took no more children from workhouses, and allowed no child under ten to work. He established a normal working-day for children, and adults, of ten-and-a-half hours exclusive, twelve hours inclusive of meals (Macnab, 111). His method of education was borrowed from Bell, whose pamphlet on education was published in 1797, and Lancaster, whose schools were started in 1798, each of whom he had assisted with £500 and £1000 respectively. But he borrowed their method with improvements. Both Lancaster and Bell tried, like Owen, to make instruction mutual and recreative. Owen went further, and abolished rewards and punishments, and his teachers taught their pupils by precept and example "to make one another happy." All taught from objects and observation. Owen, however, although he kept at his own expense a clergyman on the establishment, and allowed Bible reading and Sunday schools, excluded theological instruction from the compulsory curriculum. Drill was instituted for boys, domestic economy for girls, singing and dancing for boys and girls. Further, he extended instruction to infants of two years, then at their mothers' request to infants of one year of age—this project (1809) was only completed in 1816; and these, the first infant schools in the united kingdom, were the models of the first English infant schools set up by Lord Brougham and others in 1819 (Hansard, third series, vol. xxvii. p. 1309; *New Moral World*, vol. i. p. 11). Owen believed they were the first in Europe. But Oberlin started schools for infants of two or three years old at Ban de la Roche, apparently at the end of last century (*Memoirs of Oberlin*, p. 87). Owen continued education up till twelve years of age. The expense of education was 3s. per annum per child, paid by the parents, and £700 per annum paid by the employer (R. D. Owen's *Education at New Lanark*, 1824).

Secondly, Owen declared that healthy surroundings were as necessary to the character of adults as to the character of children. He wrote: "In pity to suffering humanity either keep the poor in the state of the most abject ignorance, or at once determine to form them into rational beings, into useful and effective members of the state." Institutions must be adapted to perfect the manufacturing community as a whole, not merely the immature portion of it. First, in order to extirpate theft, he put before each worker "a silent monitor"—a small patch of coloured wood symbolising the black, shady, or white character of the worker; *e.g.* if black, it meant that the worker had committed theft which Owen by some system of his own had discovered. A register of character was kept. Then, night watchmen paraded the streets to take down the names of drunkards; three bad cases of drunkenness incurring dismissal (*R. D. Owen*). Drink-shops were gradually abolished, and in 1819 had long been extinct. Again, an elected committee, nicknamed by the housewives "bug-hunters," inspected domestic cleanliness once a week. Then illicit intercourse was fined; fines being paid to "the support fund," and not more than twenty-eight illegitimate children were born there in nine years (Macnab's *Report*, p. 110). The support fund for sick and old, and those injured by accident, was subscribed to by all the workmen, who had to set apart $\frac{1}{60}$th of their wages — although their wages were considered by the Leeds committee of 1819 low, 9s. 11d. a week for men, 6s. a week for women. Voluntary thrift was also encouraged in two ways: special residences were set apart for those who laid by money; and a savings bank started, which in August 1819 had £3193 deposits, the population being 2481 in number. There was also a common store. Owen bought wholesale and resold at moderate profits to his workpeople, thereby underselling the former shopmen by 20 or 25 per cent, and substituting good for bad goods. This method killed the dram-shops and every other shop in the place. Further, in 1812 (see *Statement*) he projected a common kitchen "in order to save his men some £4000 a year" wasted on separate fires, cooking, etc. The kitchen dropped out of sight, and was not quite ready on 26th March 1819 (see Dr. Griscom's *Travels*, ii. 384). The effect of these arrangements was that none of the workmen were convicted of crime between 1803 (Hansard, 41, 1203) or 1804 (Macnab) and 1819. Nor according to the *Former Teacher* did Owen dismiss wrong-doers or opponents. R. D. Owen's statement as to drunkards being dismissed indicates an exception to this rule.

But these arrangements could not be carried out except in a building which should focus and be set apart for the common needs of every-day life. The projection of this "New Institute for the Formation of Character" in 1809 had frightened his old partners away, and created such hostility in his new partners that in 1813 Owen went to London to find new partners, published the first two essays of his *New View of Society* (all four essays were at first sent to every government, religious minister, etc., in 1814, and were only issued to the general public in 1816), became acquainted with the leading men of the day, and finally returned to buy in New Lanark, at a cost of £114,000, for himself, BENTHAM, Walker, J. Foster, W. Allen, J. Fox, and Michael Gibbs. The name of the institute embodied what Hazlitt called Owen's "fixed idea"—the idea which first struck him when

on his Highland tour in 1802—that "circumstances" form character. Buying cheap and selling dear, are "circumstances" which deteriorate character; they must be counteracted by some "circumstance" which brings peace, unity, and intelligence. Ties between master and man were loosened by factory labour; some new bond must be forged. The factory system was necessary, because "it is the interest of society to ensure the creation of riches with the maximum of comfort to the producer" (*Address to Powers at Aachen*, 1818), and because it was too late to go back; but it had evils, and one evil was that labour was "depreciated" by excessive competition between labourer and labourer, and, as he afterwards wrote, machinery and labourers; this evil must be met by tackling the question "how the excess of riches may be generally distributed throughout society advantageously for it" (*ib.*); and by pushing forward institutions able to raise and reunite those whom the new productive mechanism had sundered and coarsened. Hence the institute with its lectures, dances, libraries, and other instruments of rational recreation. It was the complement of the factory, and answered the character-wants which factories created. Owen advocated an ideal—a word which by the way he does not use—but an ideal in which profit is an ingredient. Griscom found the partners drawing 12½ per cent profit in 1819. Owen preached philanthropy, but not that of the Duc de La Rochefoucauld, whom he saw in France making cotton 4 per cent dearer than his own; philanthropy and a minimum of 5 per cent was to him the Law and the Prophets. This was the double bait which hooked Bentham and the Quakers, Walker, Allen, and Foster. Owen's ideal was imposed on the employees from without, and did not grow from within. But it won its way with them by persuasion, not coercion. The *Teacher's* stories of Owen's forgiveness and tolerance are conclusive on this point. Again, in 1806, when cotton imports were stopped, he paid his unemployed employees full wages, and wished to go under if they went under. As it was he only lost £7000. Again, he always foresaw that a patriarchal system of industrial government must lead to industrial self-government, and that his measures introduced "a more just equality of our race," and therefore, he said, the Duke of Kent stuck to him till the last, and men like Lord Lauderdale fell away from him. In spite of this, he never took any step to substitute the delegates for the patron at New Lanark. But then, he would have answered, "New Lanark is but a half-way house, a compromise, a second best." He had other schemes brewing. The following are two notices of the condition of New Lanark after 1828, when the opposition of his Quaker partners to his religious views forced him to retire from the firm; (1) from the *Glasgow Free Press* cited in the *Crisis*, iii. 29, which alleged that the "ornamental parts" of education had been dropped, but that dancing and singing were still taught (1833). (2) From R. Owen's "Address to Infant School Societies" in 1830, which praised the school for its elder children, but alleged that the rational infant school was no more. New Lanark seemed to be forgotten, except as a school for children.

R. Owen's further schemes may be considered under two heads:

(1) First came the tentative state socialism defined by the *New View*. Abolish state lotteries; allow licenses to sell drink to fall in without being renewed; set up national education under a department which will soon be of primary importance in the state, because that state is best governed whose members are best educated. Collect labour statistics, including the price of labour and the number of the unemployed, and keep some useful work on hand (*e.g.* on roads and canals), as a reserve for the unemployed; who if employed on these works should receive less than the market rate of wages. He was the earliest advocate, in January 1815, of the original Factory Bill, introduced by the first Sir R. Peel later on in that year. His pamphlet on the bill (1815) claims the entire credit of it. Both pamphlet and bill advocate the New Lanark day of ten-and-a-half hours exclusive, twelve hours inclusive, work, and the prohibition of children-workers under ten. The bill, not the pamphlet, limits the normal working day to young persons under eighteen, the pamphlet adding that this would practically involve all the workers in its scope; the pamphlet, not the bill, prescribes an educational test as the condition precedent of child-work, also half-time for children between ten and twelve years of age, in order that they might continue their education at their employers' expense. Owen travelled all over England to collect evidence against the white slavery, as he called it, and attended nearly every meeting of the committee which sat, as he says, for two years to inquire whether it was unhealthy for children of six and upwards to work fourteen or fifteen hours a day in stifling rooms. The subsequent limitation of the act (1819) to textile industries attests the opposition which the bill evoked, and the crucial character of Owen's evidence. The bill was brandmarked "New Lanark," and the Lanark workmen described it as a measure to extend their privileges to their fellow-workers (see their address to Owen, 7th May 1818); but whether Owen drew the bill and gave it to Sir R. Peel, as he asserts, may be doubted.

(2) But secondly, the views in the *New View* were described as a first dose, which should prepare for a second and stronger dose. This last was contained in his report to Archbishop Sutton's Committee on Distress, which sat in the London Tavern during 1816, and was referred by them to Sturges Bourne's poor-law committee, and published 1817. It recommends "villages of union and mutual co-operation," mainly agricultural but partly manufacturing, and containing (say) 1200 people. The odd plan of a parallelogram within which the villagers were to live

recalls BELLERS' "Colledge of Industry," which PLACE unearthed for him (1817 ?); and still more that characteristic outcome (in 1807) of the "l'esprit rectangulaire," as REYBAUD calls it, of the then unknown FOURIER, the phalanges. The villages were to carry on collective industry and to provide out of its profits, or better still its produce for the wants of the workers and of the infirm. They were to become first self-governing, then self-sufficient, and the ultimate goal was communism. [*Autobiog.*, ii. 303. *Explanation of Causes of Distress* (1823), § III.] Common life was to lead to common profits, and he should have added, but did not add, common losses. Now, for the first time, he advocates the integration of industry, an advocacy which ripened in his Lanarkshire Report (1820), and Dublin Reports (1823), into opposition to division of labour. The *New View* appealed to "laws of nature"; now he poses as the sole experienced "economist"; in the 1820 Report he announces that he has discovered "a new science—the science of the influence of circumstances, which is the most important of all the sciences." He was in France in 1818. Macnab speaks of his views as "social" in every page of pt. 1 of his report (1819); but M. Reybaud's assertion that the word "socialist" was not invented to denote these views until after Owen formed "the association of all classes of all nations" (1835), has not been refuted. The socialism embodied in these reports (1817, 1820, 1823), involved three distinct proposals.

(*a*) His first proposal was that 100 "philanthropists" should each invest £1000 at 5 per cent in starting a scheme. The Duke of Kent's committee, which included RICARDO, TORRENS, and others, recommended this scheme, but only £8000 having been subscribed on 1st December 1819, it was abandoned. Again, as the result of his Lanarkshire Report, operations began at Motherwell, with a capital of £50,000 advanced by the British and Foreign Philanthropic Society, but fell through from want of funds. Here the projectors expected, Peabody-fashion, to redeem the capital as well as pay interest, and then devote their profits to starting new institutions of the same character. Vandeleur's Ralahine (1831) was the outcome of Owen's Irish visit, and broke down through the bankruptcy of Vandeleur, who was patron-landlord, long before the community of tenants bought their freedom (see CO-OPERATIVE FARMING). A more important scheme was set on foot by Abram Combe and Hamilton of Dalzell, who were disciples of Owen, at Orbiston. The founders subscribed £25,000 and opened their barrack-like establishment of some 300 members in September 1826. The members soon resolved on trying communism after the founders were paid off; but long before this, Combe died (August 1827), and the business in a few months went bankrupt and the barrack was razed. But Owen had neither scot nor lot in this scheme. He was launching his scheme at New Harmony, Pennsylvania. Owen's attention had, in 1817, been called to a communistic settlement of Shakers in the New World. In 1812 John Melish printed his travels, which contained an account of a sect of "Rappites" who settled in 1805 at Harmony. Each village of 800 or so converged to a central square, and radiated into cottages where each family lived separately, had separate gardens, poultry and hogs, but in other respects lived a common life, worked mainly on agriculture, and enjoyed the profits of their work in common. In 1824 Owen went to America, bought Harmony from the Rappites for £28,000, and advertised for settlers, 900 of whom came. On 27th April 1825 he laid down as principles for the new community that (1) each should hold his goods as part of the common stock, but might withdraw at any time; if so, his goods or their value were restored to him; (2) all should work, but as a temporary provision, Owen should value the work done by each. He left for England in June, returning on the 12th of January. On the 5th of February the New Harmonists enacted (1) that all property should be held upon trust for the community; (2) a member withdrawing was only entitled to such compensation as a general assembly awarded him for his services; (3) other than this, services, etc., were not valued. On the 8th March Owen, who had not taken part in creating the new constitution, was once more despotic manager. The February constitution had meanwhile driven out malcontents into the neighbourhood, where they formed sub-colonies. In most cases, Owen granted long leases to the sub-colonists, or advanced money at 4 per cent interest for the necessary buildings and purchases; and the land so let or sold was subject to restrictive conditions against touching profits till the debt was paid off; and after that, against the division by members of profits amongst themselves, and also against spirituous liquors. And there were colonies modelled on New Harmony,—thus Miss Frances Wright advanced money to found a colony in which black and white men were equal, and permanent marriage was abolished. The latter, but not the former principle was extended to New Harmony on 4th July 1826; a date signalised by the *N. H. Gazette* as the 51st of American and 1st of Mental Independence. In another case, a Mr. Maclure advanced money to buy land and to found schools after the manner of Pestalozzi. In all these cases some one was landlord or mortgagee, subject to options to redeem or purchase; but no redemption or purchase took place. In spring 1827 Owen declared the New Harmony experiment closed. Next Maclure's, and then (1st February 1828) Miss Wright's scheme was abandoned. A few weeks later Owen resumed the last leases of the sub-colonies on the ground that their stores competed against one another, and that their external trade was run by monopolists. After these dates, the colonists and sub-colonists left, or had to support themselves. Owen, by an expenditure of £40,000, or ⅘ths of his fortune, had helped to keep his colonists going for one or two years mainly on charity—a satirical commentary on his favourite dictum that the rich deceive themselves when they think that they support the poor, since the poor support the rich. Experiments are not communistic, because workers receive subsistence in lieu of wages; communism implies the division of produce; here, so far from there being a net produce to divide, there was a

large net loss which fell almost entirely on one man.

(*b*) Nearly ruined in America, Owen returned to England to find a second branch of his scheme of 1817, 1820, and 1823, blossoming and fruitful. He had urged artisans and others with £100 (the third class in his reports), to mass their capital and elect a committee of members to superintend its application to work. Interest was payable on capital. He believed that this scheme would soon pay hugely, and that those who took part in it "began their journey near their journey's end." Co-operative capitalistic industries scarcely existed in England before 1817. Owen now returned (August 1829) to find co-operative stores in full swing, with an admirable organ of their own in Dr. King's *Co-operator* (1st May 1828 to 1st August 1830). In setting to work to develop and federate them, he employed two characteristic methods: (i.) he tried to merge them in a wider movement, and for this purpose formed a centre of culture with lectures, a paper (*The Crisis*), annual co-operative congresses, social festivals, etc.; the Mechanics' Institute, Bromley's Bazaar (Gray's Inn Road), Burton Street Chapel, and 14 Charlotte Street, were the successive "Meccas" of the new movement. The burden of the lectures was usually economical, *e.g.* "do without the middlemen." "If work is organised, an eight hours' day will be possible" (this idea first appeared in a letter by Owen, dated 9th August 1817). "The land belongs to the people." "That country is happiest which has most producers and fewest distributors." "A graduated property-tax is the best form of taxation." "International congresses should be promoted," etc. Feargus O'Connor lectured for them once, and in May 1833 the Magna Charta of social regeneration was issued partly under Owen's auspices. In 1834 a "Grand National Consolidated Trades Union," or union of all the working classes, was started. On May day 1835 the association of all classes and all nations was formed, with paid lecturers, etc. A man attended its lectures for three months, and was examined in Owen's philosophy before being elected member. It was a forestalling of university extension tacked on to co-operative and trade unionist movements. Owen's energy as a lecturer was fabulous; and in 1836, according to the *New Moral World*, ii. 214 (its new organ), there were 100,000 members. The new phasis was wrecked partly by Owen being called to superintend a new abortive Owenite community at East Tytherley, Hants (1839 to 1844), whose members alternately elected and deposed Owen as despotic manager, and had, as usual, to be kept going by other people's capital, partly by the socialists, as they called themselves, transferring their attention from economy to marriage and religion. Owen's ideas on these subjects are clearly indicated in the report by the Home Colonisation Society of his public discussion with Brindley at Bristol (cp. *Observations on the Manufacturing Systems*, 3rd ed. app. p. 42). In 1840, the bishop of Exeter and Duke of Wellington advocated, in the House of Lords, prosecutions for blasphemy; the East Tytherley community drained their funds; and the rank and file threw mud at them, which stuck (see *e.g.*, *Socialism as it is*, by Giles, 1838; *The Human Eccaleobion or New Moral Warren*, 1842). Finally the movement worked itself out, while political chartism, free trade, and trades unionism in its modern sense came to the fore. (ii.) A second colouring was given to the co-operative movement by Owen's currency craze. The 1820 report first puts into the forefront (1) Falla of Gateshead's rediscovery of the value of spade industry in cultivating wheat as the agricultural counterpart of Arkwright's discovery; and (2) the abolition of coined money as the counterpart in distributive economics of machinery in productive economics. As to this last nostrum, it was perhaps due to a misunderstanding of Ricardo's dictum, that labour is the measure of "real value" (as to which see MILL'S *Pol. Econ.* iii. xv.; M'Culloch's *Pol. Econ.* ii. i.), and to a belief in the superiority of paper to coin, which he shared with ATTWOOD and PEEL, whom he had aided in opposing the resumption of cash payments by the Bank of England in 1819. In 1830 (address to merchants) he reads these ideas into non-co-operative movements. "The wholesale and retail trade of the kingdom will soon be absorbed by a few great houses, which principle will continue to obtain until the whole business shall be taken up by *banking* bazaars." Between 16th June and 3rd September 1832 he converted his central offices into an "Equitable Bank of Exchange," which was afterwards called "The National Co-operative Trades Union and Equitable Labour Exchange," and was meant to substitute labour, which he called "intrinsic value," for money as the measure of value (see LABOUR EXCHANGE). The average hour's work "contained in commodities" was to be the unit of measurement (cp. *Autobiogr.* ii. 302; see Karl MARX). Say, a pair of boots contained "twenty hours'" work, and a pair of trousers "forty hours'" work; the cobbler would come to the bank, deposit his boots, and receive a note for twenty hours, and return next week with a second pair and receive a second note; and then if he wished, receive a pair of trousers for his two notes. For this purpose, it was essential to equalise every one's hour's work. Pending the difficulty of getting workmen to submit to this levelling, he adopted a provisional scheme which had two features: (i.) if the boot-maker who brought boots said, "I paid five shillings for materials"; the valuer wrote him down ten hours; money value of materials was the gauge of hour-credit; (ii.) bad work was counted as "containing" fewer hours than it actually took; there was a despotic valuer at headquarters. Further complications arose when (iii.) provision merchants and farmers fought shy of the system; and (iv.) 9000 hours' value was purloined from the store—a loss which Owen made good, though not legally liable.[1] After this last event (27th July 1833), Owen was superseded at headquarters; and the

[1] R. Owen's Rotunda in Gray's Inn Road: "I did not witness the introduction of the millennium, and I believe that soon after this time the Rotunda, with its happy auguries, came to an end. The excellent and truly philanthropic founder [R. Owen] spent three or four fortunes on his efforts to raise his fellow men, and his failures were in consequence of his implicit trust in human nature, and his conviction that any one may

central organisation broke up in 1834. This scheme first inflated then ruined the co-operative societies to whom it was, in the first instance, addressed. They were the principal victims. On 1st August 1829 there were 70 (King's *Co-operator*), on 1st February 1830 there were 172 (*London Co-op. Mag.*), on 30th June 1832 there were over 400 (*Crisis*, i. 59), on 27th October 1832 there were over 700 co-operative societies (*Crisis*, i. 135), between which Owen forged these paper links; three or four years later, the number had dwindled to fifteen or so. The organisation of co-operators by means of a central exchange might have been of great help; as it was, Owen's splendid follies acted as an advertisement which stimulated co-operation to an abnormal and evanescent excess.

(*c*) The third branch of the scheme (of 1817, 1820, and 1823) was that poor-law authorities should set these communities going. He based this plan on the "just and legal right" of the poor to relief which does not degrade, and to employment (cp. TURGOT'S *Droit au Travail*); and added provisions for gradually converting paupers into co-operators, and making (*c*) lead to (*b*). The government obviously seized hold of Owen's speech against the disuniting effects of churches (21st August 1817), to reject the motion made to give this scheme a trial (see speeches of Wilberforce and VANSITTART, in House of Commons, 14th December 1819). The Leeds committee rejected Owen's pauper scheme as based on *a priori* grounds, New Lanark being a manufacturing village, not an agricultural paradise of a parallelogram (1819). The Lanarkshire committee in 1820 approved of the scheme as the basis for starting a county Bridewell, then shelved it. It was not so overseas. Leigh Hunt's *Examiner* (25th April 1819), *The New Moral World*, 3rd July 1841; Mary Hennell's *Social Systems*, etc. (1844), and J. Wolber's *R. Owen* (1878), attribute the institution in 1818 of farm colonies for the unemployed in North Holland, at Frederiksoord, etc., by benevolent societies quite as much to Owen's as to General Van den Bosch's initiative; and the subsequent incorporation of "beggar colonies" of paupers in this scheme (1820-1859) was clearly due to this portion of Owen's reports (see INDUSTRIAL COLONIES).

But the reorganisation of industry was the only thing he cared about. Political reform was a matter of indifference; although power he knew would ultimately shift to the productive workers (see, *e.g.*, *Crisis*, iii. 114). He first addressed a manifesto to the working classes as such in April 1819, and urged a plea for vested interests. The short passage in the first three editions, and the Scotch and American editions of the *New View*, opposing reformers as premature, was afterwards struck out. In the *Crisis*, iii. 114, 3, he indicates the supreme importance of strikes and trades unions as compared with mere political movements. He scarcely alludes to revolution in his earlier works; but deprecates that of 1830, as expressing only individualism and competition (*Crisis*, i. p. 49, etc.), and with absurd ignorance accuses Mazzini of fostering revolutionary tendencies of the same competitive and individualistic character (*Robert Owen's Journal*, 22nd November 1851). Cold rather than hostile to any political movement, he thought industrial experiments the only social factor of paramount importance, and was as confident of success for his scheme, which he said had never been tried, in his addresses to the first two Social Science Congresses (1857 and 1858), and until he was led out of the latter, leaning on Lord Brougham, home to die, as he was at the very first outset of his career of reconstruction. "Owen," said Bentham, "begins in vapour and ends in smoke." His style is vapoury, from the time when he preached the Millennium (1st January 1816) at New Lanark, until the date of his journal entitled *A Journal Explanatory of the Means to Well Place* (*and Well Feed, Well Clothe, Well Lodge*), *Well Employ and Well Educate* (*Well Govern and Cordially Unite*) *the Populations of the World* (1850 to 1852), or until the date of his *Millennial Gazette* (1856-57). But we prefer Lord Brougham's description of his good humour and childlike simplicity (see Hansard, 14th December 1819); or Torrens's allusion to his "moral grandeur" (cited in Macnab's *New Views Examined*); or Leigh Hunt's "Yet I could at any time quit these writers, or any other, for men who in their own persons, and in a spirit at once the boldest and most loving, dared to face the most trying and awful questions of the time—the Lamennais and Robt. Owen, the Parkers, the Fosters, and Newmans."

attain perfection in any line if properly educated" (*Mrs. de Morgan's Autobiography*, p. 160).

[For illustrations of the notes in use and further details, see Art. on LABOUR EXCHANGE.]

[Robert Owen, *Autobiography* (1857-58) (ends 1823, and contains nearly all his writings down to 1832 in appendices, needs corroboration in his vivid dialogues and his dates).—A. J. J. D. R.

OWLERS were smugglers of wool or sheep to the continent when the exportation from England was prohibited, between the Restoration and the beginning of the 18th century, in the interest, as was supposed, of the home manufacture of cloth. The chief export station for rough wool was Romney Marsh, but much went also from Sussex, Essex, and Hampshire, and combed wool was smuggled in considerable quantities from Canterbury. French boats well armed received the wool at night, and their captains generally succeeded in eluding the armed sloops which guarded the Channel, and the severe penalties which were enacted against them, and of course enacted in vain as long as the owlers could make a net profit of 3d. on every pound of wool they exported. It is uncertain whether the term "owling" is a corruption of "wooling," or is derived from the smugglers' practice of carrying on their trade by night.

[John Smith, LL.B., *Chronicon Rusticum Commerciale, or Memoirs of Wool*, 1747, ii. 30, 206, 324, 536, 546, 561, with reference to Rapin, *Continuation*, p. 371.—*England's Interest Asserted*, 1669, and *England's Interest by Trade Asserted*, 1671, both by W. Carter.—*Abstract of Proceedings of W. Carter*, 1694.—*Excidium Angliae* and *Anglia Restaurata*, both by the Cheshire Weaver, 1727.—Bischoff's *Woollen and Worsted Manufactures.*—Dowell's *Hist. of Taxation*, iv. 433.—Rogers's *First Nine Years of the Bank of England*, p. 32.—Stephen's *Criminal Law*, iii. 228.]

E. G. P.

PACIOLI or PACIOLO, FRA LUCA (15th century), sometimes called Luca da Borgo, from his native village in Tuscany, was a Franciscan monk and distinguished mathematician.

He published at Venice in 1484 his *Summa de Arithmetica, Geometria, Proportioni e Proportionalita*, republished at Toscolano 1523. This contains much information on the commercial practice of his time, especially on partnership, sales, interest, drafts, and bills. His own leanings are towards a liberal interpretation of the doctrines of the CANON LAW (*q.v.*) on these subjects; he also explains clearly the method of book-keeping by double entry, particularly developed in Venice, thence called *alla Veneziana.*

A new edition of the part of this treatise relating to book-keeping was published by Vincenzo Gitti (*Fra Luca di Pacioli: Trattato di computi e scritture*) Turin, 1878; according to Goldschmidt, *Handbuch des Handelsrechts*, Stuttgart, 1891 (p. 246, note 36), it is very defective. See also Libri, *Histoire des sciences mathématiques en Italie*, iii. p. 133.—Jäger, *Lucas Pacioli und Simon Stevin* and *Der Traktat des Lucas Pacioli*, Stuttgart, 1878, who has in the latter followed the defective text of Vincenzo Gitti.

PACKMAN. A term applied to pedlars who carry their goods in a pack (see PEDLAR).

J. E. C. M.

PACOTILLE: *Fr.* (maritime trade). Seamen's ventures, or goods captains and crews were formerly allowed by custom to take with them in small quantities, on trading voyages, to sell on their own account. They were free of freight, and the practice was tolerated to interest seamen in the expedition. In the early days of maritime discovery, before the creation of factories or depots of merchandise in distant countries and colonies, the word *pacotille* was also employed to describe cargoes of various commodities taken on voyages of circumnavigation to barter with or sell to the natives. By extension cheap common goods carried by pedlars are called *pacotille*, and the word is now used in disparagement to describe any merchandise as being of inferior quality.

T. L.

PAGANO, FRANCESCO MARIO (1748-1799). Born in Brienza (Basilicata); a distinguished jurist and a martyr for Italian liberty. At twenty he began to publish his legal works. He commenced by teaching criminal law at the university of Naples. Persecuted for the ideas expressed in his writings, and exiled, he went to Rome and taught public law at the university there. He was recalled to Naples in 1799 to take part in the provisional Neapolitan government—he arranged the plan for the constitution of the republic, and presided at the legislative council. When the Neapolitan revolution was quelled he was condemned to death and executed. Pagano's memorandum on the trade in fish is of importance to economists; he follows the ideas of the physiocrats, and demands domestic freedom of trade.

In this treatise, written to convince the people of the advantage of continuing the abolition of the excise on fish, which some wished to re-enforce, Pagano observes that the price of goods is naturally determined by their quantity, and the demand for them, and that nature—through freedom of trade, not law—must fix the price. Price, established by law, may be wrong, and may damage both buyers and sellers. He would also remove the monopoly of sale granted only to a few, and would allow the fishermen themselves to sell—this right to be accorded to others as well as to fishermen; all crafts to thrive in freedom. Thus Pagano desired the abolition of all the corporations of arts and crafts, and of all obstacles and restrictions on the home trade.

Ragionamento sulla libertà del commercio del pesce in Napoli, Napoli, 1789.—*Saggi politici dei principii, progressi e decadenza della società*, Napoli, 1789.

[Fornari, *Delle teorie economiche nelle provincie Napoletane*, vol. ii. Milano, Hoepli, 1888.—Alberti, *Le corporazioni d' arti e mestieri e la libertà del commercio interno negli antichi economisti italiani*, Milan, Hoepli, 1888.] U. R.

PAGE, FREDERIC (1769-1834), a Berkshire country gentleman, author of *Principles of English Poor Laws Illustrated and Defended*, Bath, 1822, 2nd ed., London, 1829, 8vo, and of *Observations on the State of the Indigent Poor in Ireland*, London, 1830, 8vo. In the first, he insists that, *through the intervention of the State*, the indigent have a right to relief from the possessors of property. He advocates the extension of select vestries under the Sturges Bourne Act 1819 (see POOR LAW), and a strict discrimination in granting relief, according to character. The pamphlet is chiefly interesting as describing the working of the old poor-law system, under the most favourable circumstances. The later pamphlet is written to advocate a poor law for Ireland. H. E. E.

PAGET, AMÉDÉE (died about 1850), was a disciple of C. FOURIER (*q.v.*), and wrote :—

Introduction à l'étude de la science sociale (Paris, 1838 and 1841), which is considered one of the best statements of his master's doctrines.

É. Ca.

PAGNINI, GIOVANNI FRANCESCO (1715-1789), born at Volterra in Tuscany, held office in the financial department of the Tuscan government. He was a member of the "Società dei Georgofili" of Florence, a skilful agriculturist, and an able writer.

Well acquainted with the writers of the school of natural right and some English philosophers, he translated (published at Florence, 1751, two vols.) Locke's works : *Two Treatises of Civil Government* (1690) ; *Some considerations on the lowering of Interest*, etc. (1691) ; *Further considerations concerning raising the value of Money* (1698). He then reprinted parts of the *Manuali pratici*, which the two bankers Francesco Balducci and Giovanni da Uzzano had written in the 14th and 15th centuries *for the use of merchants*.

In his essay "On the right price of Commodities, etc.," he demonstrated that the Romans, who sought wealth only through war, adopted some provisions which were quite contrary to that principle which, as he says, "is able to procure its citizens or subjects the power of using advantageously the produce of its territory, as well as to protect and forward manufactures and facilitate the export of both manufactures and natural products ; and as far as possible to prevent the introduction and consumption of foreign goods." And as the system of conquest was no longer possible, and by themselves the states could no longer provide for agriculture and war, Pagnini praised and suggested such measures of government as were not designed to procure the state abundance of foreign commodities and goods, but to save it also "the expense which the consumption of the same would imply, and to enable it also to acquire the gold and silver of other nations." In his remarks on the question of value, Pagnini did not follow the doctrines of LOCKE, whom he had translated, but those of PUFENDORF. He admitted the existence of an actual market value only, not that of a natural or normal value ; and he maintained, though he gave it a special meaning of his, the theory of supply and demand as VERRI, ORTES, GIOIA, GALIANI, and others had done. He also maintained that the ideas of the Romans about the origin and functions of money were altogether opposed to the theories of modern economists, a thesis which was completely refuted by NERI and CARLI (see PAULUS JULIUS). In his work *Della Decima* (see DÉCIMES), Pagnini gives a history of that tax and the trade of the ancient Florentines, with a digression on the value of gold and silver, and on the rate of prices of commodities in the 14th and 15th centuries compared with those of the 18th century. This work is still of use in the study of prices—*Saggio sopra il giusto prezzo delle cose, la giusta valuta della moneta e sopra il commercio dei Romani*, inserted in Custodi's *Raccolta*,—*Scrittori classici d' economia politica*, modern part, t. ii., Milano, 1813.—*Della Decima*, Lisbona e Lucca, 1765, and Firenze, 1756-66. A. B.

PAGODA, HISTORY OF. A gold coin of southern India, known also by the native names of *varâha* or *hûn*, the former word indicating the "Boar" *avatâr* of Vishnu, figured on south Indian coins from the 5th century onwards, whilst *hûn* (=gold) is their later Mahommedan name. From the 16th century onwards this was the Portuguese "pardao de ouro," perhaps meaning "a quarter" of a gold rupee. The name pagoda is sometimes derived from Persian words meaning idol-temple, but more commonly from the Sk. *bhagavat*=holy, for the reason given in Fra Paolino's *Viaggio* of 1796 that the coin bore "the effigy of the goddess Bhagavadi, a name corrupted into pagoda by Europeans" (cp. Linschoten's *Travels* of 1596):—"They are Indian and Heathenish money with the picture of a Diuell upon them and therefore are called Pagodas." The effigy in question was that of Krishna, or Swâmi, whence the "swamy-pagoda" of Madras, containing about 46 grains of fine gold. Still better known was its successor, the "star-pagoda" of Madras, which was the standard coin of south India till 1818. This coin, bearing the eponymous device of a star, contained by law 42·048 grains fine, and was therefore worth about 7s. 6d. There were also Pondicherry and Porto Novo pagodas worth about 1s. less. All these three varieties were familiar at the beginning of the present century throughout the Indian currency area, which then included not only Ceylon and Mauritius, but also the Cape and St. Helena. Even in New South Wales, in 1800, the pagoda was constituted a legal tender. By proclamation of 7th January 1818 in Madras the coinage of the gold pagoda

was stopped, in view of the establishment of the silver rupee as the standard coin of the presidency. With the pagoda gold disappeared from normal circulation in India.

Yule, *Hobson Jobson.*] R. C.

PAINE, THOMAS (1737-1809), born at Thetford (Norfolk), died in New York; held an appointment in the excise, on his dismissal from which in 1774 he went to Philadelphia; there, through introductions from Franklin, he made friends and obtained employment in journalism. He took an active part in the American War of Independence, and in 1777 was made secretary to the committee of foreign affairs. His *Crises* (1776-83) were acknowledged by Washington and others as having powerfully assisted the cause of separation. Leaving America in 1787, he visited Paris and London, where he published his *Rights of Man* (1791 and 1792), a reply to Burke's *Reflexions on the French Revolution*. He was thereupon elected to the convention, and subsequently to the committee for framing a new constitution. His association with the Girondins aroused the enmity of Marat and Robespierre, and he spent the greater part of 1794 in prison, where he completed his *Age of Reason*. He returned to America in 1802.

Paine's merits and defects are those of a partisan. In his economic, as in his political and religious writings, his aim is not the complete investigation of a subject with a view to the discovery of truth, but the application of foregone conclusions to particular cases; he displays, however, moral though not intellectual sincerity, along with much originality and acuteness of observation. His style is clear and vigorous, and he is a master of telling and suggestive phrases, like his definition of government as "a mode rendered necessary by the inability of moral virtue to govern the world" (*Works*, vol. i. p. 71), and his anticipation of the spirit of the Monroe doctrine—"Nothing but continental authority can regulate continental matters" (*Works*, vol. i. p. 107). The *Crises* (1776-83), the *Forester's Letters* (1776), and the *Letter to Raynal* (1782), which deal with the subject of colonial and imperial relations, are still of interest as an exposition of the disadvantages arising from too close a connexion between the mother country and a fully developed colony. But Paine was obviously mistaken in regarding political independence as the only means of freeing colonial trade from vexatious restrictions, and in denying that the colonies had derived any benefit from British protection during the wars of the 18th century. How little he realised the force of the imperial idea was shown by his attempt to prove that Canada and Halifax were possessions useless to England, and inevitably destined to amalgamation with the States (*Works*, vol. ii. pp. 123-5). The value of another group of works, treating of administration and its relation to economics, and including *Common Sense* (1776), *Prospects on the Rubicon* (1787), *The Rights of Man* (1791), *Address to the Addressers* (1792), and the *Dissertation on the First Principles of Government* (1795), is diminished by the prevalent fallacy that "every civil right grows out of a natural right" (*Works*, vol. ii. p. 307). Paine, however, is in harmony with modern thought in his refusal to identify society with government (*Works*, vol. i. p. 69), in his support of the principle, first perceived by the PHYSIOCRATS, that the prosperity of a commercial nation is regulated by the prosperity of its rivals (*Works*, vol. ii. p. 457), and in his condemnation of illicit trade (*Works*, vol. i. p. 379). He was the author of several ingenious schemes of taxation, including one for the abolition of the poor-rate (*Rights of Man*, pt. ii., 1792). In the *Dissertation on Government, the Affairs of the Bank, and Paper Money* (1786), according to Mr. Conway, he overwhelms "the whole brood of heresies—State privilege, legal tender, repudiation, retrospective laws" (*Life*, vol. i. p. 217). But, like some other advocates of "honest money," Paine is not free from the heresy of regarding abundant currency as a disadvantage (*Works*, vol. i. p. 226). Among his other works may be mentioned the *Letters* (1779), in which he argues for the "natural right" of the United States to the Newfoundland fisheries; *Public Good* (1780), dealing with the question of state sovereignty; and *Agrarian Justice* (1797), opposing the system of landed property, and containing a proposal for state compensation in money to those debarred from the possession of land.

[The references in the text are to Paine's *Works*, ed. Conway, London and New York, 1894-6; and to Conway, *Life of Thomas Paine*, London and New York, 1892. See also *Dict. of Nat. Biog.*, London, 1895, vol. xliii., article "Paine, Thomas," by Leslie Stephen.] E. R. F.

PALE (IRELAND) denoted the district within which direct English law and control existed. First used in the 15th century, it applied to the greater part of the four counties of Dublin, Louth, Meath, and Kildare. The Statute of Drogheda (1494) provided that the pale should be surrounded by a double fence and ditch to prevent marauding incursions by the Irish. The chief points in this boundary were Dundalk, Kells, Naas, and Tallaght.

[Hardiman in *Tracts on Ireland*, vol. ii. (1841), issued by the Archæological Society.—Bagwell, *Ireland under the Tudors*, vol. i. p. 123.] C. F. B.

PALEY, WILLIAM (1743-1805). Paley was senior wrangler 1763, fellow of Christ's College, Cambridge, 1766, chaplain of Bishop Law at Carlisle, 1769. After holding various livings he became archdeacon of Carlisle (1782), the title by which he is best known.

He wrote at greatest length on natural theology and the evidences of Christianity (*Horæ Paulinæ* 1790, *Evidences of Christianity*, 1794, *Natural Theology*, 1802). The two writings that bear

most on economics are the *Principles of Moral and Political Philosophy* (1785) and the tract, *Reasons for Contentment addressed to the Labouring Part of the British Public* (1793). This tract was written at a time when there was war with France together with depression of trade and general suffering, when there was much public agitation in favour of reform, with much straining of the laws against sedition, when booksellers great and small were prosecuted for selling Paine's *Rights of Man*, "that being treason in duodecimo which is innocent in quarto" (Windham). Paley tells the grumbling mob that they should not make comparisons, but do their own duty and mind their own concerns (4, 5); let them consider that the same law which protects the rich in their property protects the poor man in his, and as the poor man is the weaker he needs the protection more (5, 6). Besides, the labouring man has as much of the real pleasures and blessings of life as the rich, without the care and the temptations (7-11, cp. 14, 15). Indeed in security and certainty of provision for his family the poor is superior (11, 12). Service for wages Paley takes to be "the best way of conducting business, because all nations have adopted it" (13), and it is as equitably regulated in England as anywhere (13). "I have no propensity to envy any one, least of all the rich and great; but if I were disposed to this weakness, the subject of my envy would be a healthy young man in full possession of his strength and faculties, going forth in a morning to work for his wife and children, or bringing them home his wages at night" (18). Finally changes of condition that break up our ordinary habits of living "never can be productive of happiness," "it is not only to venture out to sea in a storm but to venture for nothing" (22). This pamphlet was meant quite seriously, and attracted some attention.

Paley seems not to have studied either HUME or Adam SMITH. In his *Moral and Political Philosophy*, he borrows his utilitarian doctrine from Abraham Tucker's *Light of Nature Pursued* (1768-78). He is on the whole a defender of things as they are, though this sometimes leads him into hazardous arguments. He defends the institution of property by urging that it increases the produce of the earth, preserves it to maturity, prevents contests about it, and "improves the conveniency of living," by allowing division of employments and encouraging art and invention (*ib.* ch. ii.). "The poorest and the worst provided, in countries where property and the consequences of property prevail, are in a better situation with respect to food, raiment, houses, and what are called the necessaries of life, than any are in places where most things remain in common" (*ib.* ch. ii.). The foundation of the right of property is not, as LOCKE said, labour, but "the law of the land," and that is founded ultimately on "the will of God" (ch. iv.). The special chapters on contracts of sale, hazard, inconsumable property, lending, and labour, ch. vi.-xiv., have little or no economic value, though ch. viii., on general consequences, has some points neatly put in the style of BASTIAT'S *Popular Sophisms*.

In the chapters on charity (pt. ii. ch. i.-v.) there are instances of arguments reaching farther than the author intended; *e.g.* "it is a mistake to suppose that the rich man maintains his servants, tradesmen, tenants, and labourers; the truth is they maintain him." "All that he does is to distribute what others produce, which is the least part of the business." One chapter (v.) on pecuniary bounty can hardly be reconciled with the *Address to Labourers;* "the dread of want" is included among the evils of poverty, and the plea that "the poor do not suffer so much as we imagine" is rejected: "the question is not how unhappy any one is, but how much more happy we can make him."

The section (bk. iii. pt. iii.) devoted to marriage is more of a sermon than an economic discourse on population. We need of course to remember that the book is not professedly economic. The subject of "population and provision" is discussed by itself in a later section, bk. vi. ch. xi.). Paley thinks that on the whole "twice the number of inhabitants will produce double the quantity of happiness." "It may and ought to be assumed in all political deliberations that a larger portion of happiness is enjoyed amongst ten persons possessing the means of healthy subsistence than can be produced by five persons under every advantage of power, affluence, and luxury." "Consequently the decay of population is the greatest evil a state can suffer, and the improvement of it the object which ought in all countries to be aimed at in preference to every other political purpose whatever." He allows "the tendency of nature, in the human species,[1] towards a continual increase of its numbers." "The two principles upon which population seems primarily to depend, the fecundity of the species and the capacity of the soil, would perhaps in all countries enable it to proceed much further than it has yet advanced." "The condition most favourable to population is that of a laborious, frugal people ministering to the demands of an opulent luxurious nation, because this situation, whilst it leaves them every advantage of luxury, exempts them from the evils which naturally accompany its admission into any country." This is the passage criticised by MALTHUS (*Essay*, iv. xiii.); Malthus quotes a passage in Paley's *Natural Theology* (ch. xxvi.) where Paley seems to modify his views. He had (in the *Mor. and Pol. Phil.*) regarded luxury as bad for the luxurious, though good for those that supplied them; "the business of one half of mankind is to set the other half at work" (vi. xi.). In the *Natural Theology* he says that "mankind will in every country breed up to a certain point of distress," a point which will be high or low according to the country. He also accepts the statements of Malthus (the author of "a late treatise upon population") in regard to geometrical increase. Malthus draws the inference that Paley must now admit luxury to be a benefit to the luxurious themselves, and the wide diffusion of luxury to be a safeguard against overpopulation, in so far as luxury raises the "point of distress" higher and produces a check on

1 Cp. *Nat. Theol.* ch. xxvi., where the same "superfecundity" is allowed of all animal life.

population sooner. For Paley's philosophy and theology, see Leslie Stephen's *English Thought in the 18th Century*, vol. i. (1876), and Mackintosh's *Dissertation on Ethical Philosophy* (7th ed. of *Ency. Brit.*). J. B.

PALISSY, BERNARD DE (1500-1589), died a Protestant prisoner in the Bastile. Celebrated for his artistic pottery, his *figulines rustiques* as he called them, he enjoyed for a time the protection of the kings of France, after having exhausted his own slender means, and worked for sixteen years, to discover the composition of the enamels used in Italy.

Though a poor and illiterate man, he left several works remarkable for clear insight into natural and economic phenomena. In geology he was in many respects a harbinger of modern science. In his *Recepte véritable pour apprendre aux hommes à multiplier leurs trésors* (1563), he gives useful advice to agriculturists on the use of manures—their object is to return to the soil the elements which have been exhausted by the crops. "Philosophy," he affirms, should lead and direct agriculture. In his *Traité des Métaux et Alchimie*, (1580), a dialogue between "*Théorique*" and "*Practique*," he ridicules the futile researches of alchemists, who, he said, should be called "anti-philosophers"; according to the opinion of Practique: "A pestilence, a war, or a famine would be less injurious than six men who knew how to make gold in great quantity. If once their process were divulged, everybody would despise tillage, and land would remain a waste . . . Gold would become so depreciated that nobody would give bread or wine in exchange." This view, so strikingly in advance of the times, was, a century later, again expressed by LEIBNIZ in his *Oedipus Chymicus*. Palissy's works were republished in 1880, one vol. [Henry Morley, *Palissy the Potter*, London, 1852. E. Dupuy, *B. Palissy, l'homme, l'artiste, le savant, et l'écrivain*, Paris, 1902.] E. CA.

PALMER, J. HORSLEY (1780-1858), for fifty years one of the most eminent and esteemed of English merchants, became a director of the Bank of England in 1811, and governor for the three years 1830-1832.

Palmer gave an able explanation of the working of the system of the bank (see BANKING; BK. OF ENG.) before the committee of 1832 on the bank charter. He further stated his views in *The Causes and Consequences of the Pressure upon the Money Market, with a Statement of the Action of the Bank of England from 1st October 1833 to 27th December 1836*, London, 1837, 8vo, which called forth a reply from S. JONES LOYD (*q.v.*), *Reflections suggested, etc.*, 1837, republished in *Tracts*, 1858. Palmer defended his position in a *Reply to the Reflections, etc.*, 1837, 8vo. His views are further criticised in Tooke's *History of Prices*, vol. iii. pp. 91-114. Palmer also wrote *Reasons against the proposed Indian Joint-Stock Bank*, London, 1836, 8vo.

[*Times*, 11th February 1858.—*Annual Register*, 1858.] H. E. E.

PALMERI, NICOLO, born at Termini, Sicily (end of 18th century, died July 1837). His liberal principles prevented him from seeking public employment. He lived in obscurity, devoting his life to study.

He was an economist of the school of Adam SMITH. Besides many minor writings published in reviews and newspapers, he wrote an *Historical Résumé of Sicily*, and an essay in which he demonstrates the wretched state of Sicilian agriculture, recommending, with a courage unusual for the epoch and country in which he lived, the opening of the Sicilian ports to free trade with foreign countries as the only remedy for existing evils. Even in our times, when the Sicilian problem, far from being solved, or even appeased, has grown more acute and alarming, the remedies proposed by Palmeri are still worthy of consideration. His essay, which fell accidentally into the hands of Francesco Ferrara, induced the latter to apply himself to economics. (See *The Life and the Doctrine of Francesco Ferrara*, by A. Bertolini, Bari, 1895).

Saggio delle cause e delle angustie attuali dell' economia agraria della Sicilia, Palermo, 1826. A. B.

PALMIERI, GIUSEPPE (1721-1794). Born in Martignano, province of Lecce; of a noble Neapolitan family; was an economist, financier, and statesman. He began life as a soldier, and then became a disciple of GENOVESI; he again returned to military life, in which his career was brilliant, but at thirty-eight he finally abandoned it and devoted himself to study, agriculture, and public life. In 1738 he was charged with the reorganisation of the finance of the province of Lecce, and in 1791 was made director of the board of finance in the kingdom of Naples.

As a statesman, Palmieri tried to apply the principles of economic science to public administration; he rescued the latter from many abuses, promoted the abolition of turnpike tolls and feudal rights, and together with FILANGIERI assisted greatly in the formation of the Neapolitan customs tariff of 1788, which was a great step towards simplifying taxation and a rational organisation of the customs.

His views on commerce are of especial importance. He advocates moderate protection to commerce and agriculture; he admits the advantages of free trade applied universally—absolute freedom for commerce in the interior; but he suggests for Italy limits to the freedom of foreign trade as a defence against foreign competition, and to assist the promotion of national industries as other countries do.

He combats the doctrines of the PHYSIOCRATS, especially with respect to the importance of foreign trade, which he maintains to be a true source of wealth for the nation. He was the soul of the theoretic and practical reform of the study of economics and finance in the kingdom of Naples towards the end of the last century.

He discussed the general theory of taxation, as well as detailed questions of finance, and

originated and encouraged many interesting discussions on the errors and prejudices of existing systems and necessary financial reforms. He minutely analyses taxation, preferring, on the whole, indirect taxation. This opinion had many supporters in his day, but for variety of observation, critical acumen, largeness of ideas, and diversity of argument, Palmieri far surpasses all other writers of his time. His works gave a great impulse to the scientific life of his day, and proposed improvements into public administration by showing the baneful effects of the existing system on trade and economics.

The fundamental conception of the financial reforms suggested, and to a great extent carried out by him, consists in greatly simplifying the system of taxation combined with freedom to trade, agriculture, and traffic. Abolition of internal customs, reduction of frontier customs, particularly of those on export of goods, reorganisation of customs tariffs and reform of the crown estates, were the measures proposed by Palmieri for the improvement of the economic position and finances of the kingdom of Naples.

Palmieri wrote, *Riflessioni sulla pubblica felicità relativamente al regno di Napoli*, Napoli, 1787.—*Pensieri economici relativi al regno di Napoli*, Napoli, 1789.—*Osservazioni su varii articoli riguardanti la pubblica economia*, Napoli, 1790.—*Lettera sulla nuova tariffa doganale*, Napoli, 1790.—*Della richezza nazionale.*—Napoli, 1792.

[See on Palmieri, among others, Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd edition, Palermo, 1896.—Fornari, *Delle teorie economiche nelle provincie Napoletane*, vol. ii., Milan, 1888.—Gobbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.] U. R.

PALMIERI, MATTEO (1405-1475). In his treatise *Della vita civile* (Florence, 1529) Palmieri deals with political economy and finance. He supports proportional and condemns progressive taxation proposed at that time in Florence, as he considers diversity of fortune is in the order of nature, and should not be altered by taxation. The basis of Palmieri's opinion is that taxation is an obligation to the state, imposed on all citizens in return for the assistance given by the state in the formation of private fortunes, and that it should be distributed among them in proportion to wealth, so that property may bear its part without changing the natural distribution of wealth. This is a very remarkable conception for those days, as it shows that even then the most important financial controversies turned on this point, and it offers a certain analogy to the modern doctrine of equality of sacrifice.

[Ricca-Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd ed., Palermo, 1896.—Cossa, *Introduzione allo studio dell' economia politica*, Milan, 1892.] U. R.

PANIC, COMMERCIAL. See CRISES.

PANNAGE. Originally this word seems to have meant simply the food, acorns, beech mast, etc., which pigs could find for themselves in a wood. Generally, however, in mediæval records, it means either the right of feeding pigs in a particular wood, or the annual rent paid for that right. Thus, the statement, that in a certain wood there is pannage for twenty pigs, means that twenty pigs could pick up a living there: A. B. has pannage for twenty pigs in such a wood, means, that A. B. has the right to turn out twenty pigs, to find a living there; while in the forest-officer's accounts the word pannage would mean the rent paid by A. B. for this right.

[Pipe Roll Society's publications, vol. iii.—Cowel's *Interpreter*, London.] A. E. S.

PAOLETTI, FERDINANDO (1717-1801), parish priest of S. Donnino at Villa Magno, near Florence, was an intelligent practical agriculturist and an excellent writer on that subject.

A follower of the PHYSIOCRATS, Paoletti published, 1769, *Pensieri sopra l' agricoltura*, part of which CUSTODI inserted in his *Raccolta* (see *Scrittori classici di economia politica*, modern part, t. xx.), and, 1772, *I veri mezzi di render felici le società*, in which, as every physiocrat in Italy as well as in France did in his time, he brought forward free-trade ideas on the corn-trade. His belief in the good effects of free-trade induced him to reproach BANDINI for his prejudice against public stores of produce (see GRENIERS D'ABONDANCE). Yet he supported, in his *Veri mezzi*, taxes on luxuries, the idea of aiding the exportation of commodities not of the first necessity such as oil, wine, etc.; and in his *Pensieri* protective duties to encourage agriculture. Cossa therefore (*Introduction*, p. 269) rightly places Paoletti among those who, though accepting the new theories of the physiocrats, could not altogether give up the old ones of the mercantilists.

Pensieri sopra l' agricoltura, Firenze, 1769, 2nd ed. 1789.—*Veri mezzi di render felici le società*, Firenze, 1772 (in *Raccolta del Custodi*). A. B.

PAOLINI, GIOVANO BATTISTA (end of 18th century). Born in Pistoja, an eclectic writer on economics, his idea is that laws cannot be fixed on absolute and universal principles, but must be subservient to conditions of time and place, so that under different circumstances any system may be advisable. In foreign commerce Paolini recommends "legitimate," not "absolute freedom"—that is, "a right to cultivate, work, transport, export, and introduce such goods as are useful to the whole country—this freedom to be limited and regulated by laws and duties wherever the good of the country demands it. Hence in the application of such freedom it is necessary to consider the existing circumstances of the country," hence also "certain economic laws might be good for ancient but bad for modern nations."

Paolini wrote, *Della legittima libertà del com-*

mercio, Florence, 1785. (See Gobbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.) U. R.

PAOLINO, a Minorite of Venice, lived in the first half of the 14th century. In the solitude of the monastery he devoted himself to study the political and economical problems of society with brilliant talent, but also with the defects common to his age and condition, namely a complete submission to the doctrines of Thomas AQUINAS (*q.v.*), and a total want of practical knowledge of men and things.

His name and work would probably not have been known had not Prof. Mussafia, an Italian philologist teaching at Vienna, published, in 1868, with notes, the *Trattato di Fra Paolino*, in which he speaks of the family and of the state, laying down rules for their moral encouragement, as the many writers *De regimine, institutione, eruditione Principum* of that time had done, among whom the poet Petrarch (1304-74), *De republica optime administranda;* Egidio Colonna (1247-1316), *De regimine Principum* (anterior to Paolino) among the politicians; and Andrea d'Isernia (1220-1316), among the jurisconsults, are worthy of being mentioned.

Trattato de regimine rectoris (1313-1315), Vienna, 1868. A. B.

PAPER BLOCKADE. A phrase used to denote a blockade maintained by an insufficient force or by no force at all. INTERNATIONAL LAW requires that a belligerent power, which claims the right of capturing all vessels attempting to run in or out of an enemy's port, shall have rendered ingress and egress dangerous by sending a ship or ships of war to cruise off the port in question, in such a position and in such numbers that they are almost certain to intercept all who approach (see BLOCKADE). This is the only kind of blockade neutral states are bound to submit to. The fourth article of the DECLARATION OF PARIS laid down that "blockades to be binding must be effective, that is to say sufficient really to prevent access to the coast of the enemy." In drawing up this rule the statesmen of the Congress of Paris of 1856 did but formulate an accepted principle. The ARMED NEUTRALITY (*q.v.*) of 1780 had declared not only that there must be evident danger in entering the blockaded port from the proximity of the blockading squadron, but also that the vessels which composed it must be stationary. In 1800 the second armed neutrality added that ships were entitled to a warning by the commander of the force which closed the port, and might not be captured unless they made an attempt to enter after having been warned. The great agreement of 1856 was silent as to these fanciful restraints upon the undoubted right of a belligerent; but gave the sanction of express consent to the just and reasonable rule which forbids a power at war to interfere with neutral trade by merely forbidding commerce with its enemy's ports. This had been done often enough in mediæval times, and was not unknown as late as the 18th century. But the great events of the close of that epoch, and the growth of a reasoned system of maritime law from the decisions of the prize courts of the leading nations of Europe and America, settled definitely that a belligerent could not enjoy the rights against neutrals given by blockade without fulfilling the obligation of maintaining his blockade by a sufficient naval force. The civilised world has accepted this principle for more than a century. The violations of it, ordered by Napoleon's Berlin and Milan decrees, and the retaliatory British Orders in Council, were justified on both sides as reprisals for the illegal violence of the enemy (see CONTINENTAL SYSTEM; ORDERS IN COUNCIL). But no attempt was made to show that they were part and parcel of ordinary international law. The statement that Great Britain upheld paper blockades up to the time of the declaration of Paris is entirely destitute of foundation (Calvo, *Droit International*, iv. 177). The slightest knowledge of the decision of Lord Stowell, our great judge of the Courts of Admiralty during the long war with Napoleon, would be sufficient to dispel this illusion. Our own country is at one with others in insisting upon the wholesome rule that belligerent ports cannot be hermetically sealed against the commerce of the world by a mere paper decree. The great economic importance, to a country situated as Great Britain is, of freedom of access—where possible—to the ports of the world, needs no comment.

PAPER MONEY. See MONEY.

PAPER, TAXES ON, fall under two heads, those on paper as a manufactured article, and those on newspapers and advertisements. (1) The tax on paper, varying according to quality, was imposed in 1712, increased in 1714; it included a duty of 1s. a square yard, in addition to the ordinary duty, on all printed, painted, or stained paper used for hangings or other purposes. The yield in 1793 was in Great Britain £83,079, and, the tax being raised in 1794 and doubled in 1801, while the manufacture was greatly improved, by 1802 the yield had risen to £268,000 for England alone, by 1815 to £476,019 for Great Britain. The complications attending the incidence and collection of the duties, apart from the social disadvantages produced by taxes on knowledge, led in 1836 to the consolidation and simplification of the tax, which was fixed at 1½d. a pound on all sorts of paper alike, except the

stained and other paper used for hangings, which was now freed altogether. An attempt to repeal the whole tax was defeated by the Lords in 1860, but carried in 1861, at which time the yield was about £1,350,000. Many reasons combined to turn the scale against the taxes; they were so complex that it was difficult for papermakers to understand their liabilities; other manufactures into which paper enters, though supposed to be free, were virtually taxed; all other manufactures being by this time freed, it was either invidious to keep taxes on one, or else unfair to protect it; and as most of the required supply of rags, the raw material of paper, could be had in England, reciprocal duties were not needed to protect the trade against the large export duty on rags levied in France. In spite of prophecies to the contrary, the manufacture has largely increased since the repeal.

(2) A tax was first imposed on newspapers at the same time as on paper in general, half sheets were to pay ½d., whole sheets 1d., and every advertisement 1s. Each great war saw these rates increased, and once in 1789 they were raised in time of peace. The highest point reached was 3½d. for half sheets and 4d. for whole sheets in 1797, with 3s. 6d. for every advertisement before the end of the French Revolution war. But the latter tax was reduced to 1s. 6d. in 1832, and altogether repealed in 1853; while the tax on newspapers was lowered in 1836 to 1d., provided the paper did not exceed certain limits of size, and was repealed in 1855. The newspapers of Great Britain paid, in 1749, £16,450; in 1815, £383,696; in 1831 over £552,000. After a temporary drop owing to the reduction of the duty the yield rose again, and at the time of the repeal reached £488,010, the immense impetus to publication having nearly compensated for the lowered rate. The advertisement revenue rose from £125,000 in 1815 to £181,000 in the year of the repeal of the tax.

PAR. On the stock exchange, the nominal or face value of a security. With government or municipal stocks, and British railway stock, "par" is always taken at £100—with shares in companies, at the amount called up. For new issues, before the special settlement has taken place (see SETTLING DAY), it is customary to give quotations at so much "premium," or "discount" (*q.v.*), reckoned upon the amount called up to date. R. W. B.

PAR OF EXCHANGE. See MINT PAR.

PARADISI, AGOSTINO (1736-1783), occupied one of the earliest established chairs of political economy in Italy, and was in his day a well-known prose writer and poet. In 1772 Duke Francis III. appointed Paradisi to teach economics at the university of Modena, endowed by him with new statutes and branches of study. Paradisi held this chair until 1780, when the new duke, for economy's sake, reduced the pay of the professors. On this Paradisi resigned and retired to Reggio, his native place, where he died three years later, president of instruction. His unpublished *Lezioni di economia civile* were highly valued in his own day. During the last years of his teaching Paradisi put them aside to use as a textbook Condillac's *Le commerce et le gouvernement* (published in 1776), which he translated and annotated in a work that has also never been published. Copies of the manuscript of his lectures are in the libraries at Modena and Reggio-Emilia. The more important part of the work is the special treatment of the subjects of value and wages.

In Paradisi's writings the influence which the French philosophy of the 18th century exercised on his mind may be traced as well as the doctrines of the physiocrats.

Paradisi and MURATORI were precursors of the economic, financial, and administrative reforms originated and partly carried out in Modena under Duke Hercules III. (reigned 1780 to 1796).

[Cossa, *Saggio di economia politica*, Milan, 1878.—*Sulle prime cattedre di economia in Italia.*—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, Modena, 1893.] U. R.

PARAGIUM, holding in equal portions as well in rights and privileges as in actual property (Ellis). The full scope of the word is given by Kelham, who says it "signifies equality of name, blood, or dignity; but more especially of land, in the partition of all inheritance between co-heirs; or it is when the younger brothers hold their share of the fee of the elder brother, and he [holds] of the lord and does homage and service, they contributing their shares." On folio 96 *b* of Domesday we read, xxii. *masuræ quas tenebant*, xx. *homines in paragio;* and on folio 51 *b*, Wislac and Aluric, two tenants *in capite*, are recorded as holding *in paragio.*

[Ellis, *Introd. to Domesday*, i. 241.—Kelham, *Domesday Book illustrated*, p. 290.—Pollock and Maitland, *History of English Law*, ii. pp. 261, 274, 289, treat the subject exhaustively.] R. H.

PARCENERS. When two or more persons have become entitled to an estate by descent as co-heirs, they are called, in law, coparceners or parceners. This happens by the common law chiefly in the case of females; but as the heirs of a sister deceased become coparceners with the surviving sisters, males may stand in that position.

The custom of gavelkind also led to coparcenary among male heirs. It was the only form of joint ownership in which the

ancient common law granted the power of severing estates without mutual consent. The estate in coparcenary devolving on persons by the act of the law and not by agreement, it was held that no lack of consent should prevent a change into a more convenient form of ownership. This was formerly done by a writ of partition, now abolished by 3 & 4 Will. IV. c. 27, § 36. When the partition is voluntary it must be effected by deed, when otherwise the aid of the Court of Chancery is available. Sales may now be effected under 31 & 32 Vict. c. 40, and 39 & 40 Vict. c. 17, and so the difficulties which used to arise with regard to mansions and certain commonable rights can be avoided.

Cases of coparcenary as early as A.D. 1200 may be found in F. W. Maitland's *Select Civil Pleas* (Selden Society).

[Blackstone's *Commentaries*.—J. Williams, *Law of Real Property*.—Brett, *Commentaries on present laws of Engl.*, 1891.—Pollock and Maitland, *History of English Law*, ii. pp. 272-276, 304.] R. H.

PARDESSUS, JEAN MARIE (1772-1853), a lawyer, judge at the *Cour de Cassation* (supreme court), professor of commercial law, and at various times a member of the French representative assemblies. His *Collection des Lois Maritimes antérieures au XVIII^e Siècle* (Paris, 6 vols., 1828-39) gives the original text and French translations of all maritime laws from the remotest periods, with notes and a historical introduction. The first eleven chapters (Antiquity and Middle Ages) were reprinted separately in 1847 under the title of *Us et Coutumes de la Mer* (2 vols.).

Pardessus also published *Lettres de Change*, (1807) a treatise on bills of exchange; *Servitudes* (1829) on legal liabilities of property and *Cours de Droit Commercial* (1831). E. Ca.

PARE, WILLIAM (1805-1873), son of a Birmingham cabinetmaker and upholsterer, was one of the earliest and ablest of the disciples of Robert OWEN, having been converted to his doctrines by William THOMPSON, whose *Inquiry into the principles of the distribution of Wealth*, published in 1824, he re-edited in 1850. He was corresponding secretary of the first Birmingham co-operative society, and Mr. Holyoake says of him that "he was at his death the oldest and best informed co-operator in England." He was compelled to resign the office of registrar of births, deaths, and marriages in Birmingham, in consequence of Dr. Philpotts, then Bishop of Exeter, having brought before the House of Lords the fact that he sympathised with socialist views. He became an active apostle of Owen's system; he undertook several "missionary tours" for the purpose of preaching it, and was for some time governor of the Owenite community of Harmony Hall in Hampshire.

His writings are: *The Claims of Capital and Labour: with a sketch of practical measures for their conciliation*—a paper read before the Dublin Statistical Society, 1854. The immediate occasion of this paper was the strike and lock-out at Preston in 1853-54. The measures he suggests are (1) a reform of our money laws which would abolish the use of gold, or of anything in itself valuable, as a measure of value. This seems to point to the adoption of Owen's system of Labour notes (see LABOUR EXCHANGE); (2) universal and compulsory education and industrial training from a very early age. This does not necessarily imply, but was probably in his thought connected with, an associative, as opposed to the domestic, rearing of the young; (3) an alteration in the law of partnership, giving not only limited liability (see LIABILITY, LIMITED), but a limited authority and control; (4) the formation of INDUSTRIAL COLONIES (*q.v.*) at home by funds advanced on loan by the state, as a practical recognition of the right to labour.—*Equitable Commerce, or Cost the limit of Price*, read before the British Association, 1855, the object of which was to explain and defend the labour exchanges devised by Owen and carried on in establishments founded by him in London and Birmingham.—*A Plan for the suppression of the Predatory Classes*, a paper read before the Social Science Association, 1862. The plan was that all premises serving as harbours for the criminal classes, or in any way used in complicity with them or their practices, should bear the whole burden of the taxation necessary for the detection and punishment of crime, so that the owners would be forced either to obtain honest tenants or dispose of their property to those who would.—*Co-operative Agriculture: a solution of the Land Question*, 1870, in which is given an account, founded on personal observation, of a co-operative agricultural association established in 1830 by Mr. John Scott Vandeleur, a resident Irish landlord of position, on his estate of 618 acres at Ralahine in the county of Clare (see CO-OPERATIVE FARMING). This experiment, notwithstanding the ignorance and previous turbulent disposition of the labourers, seems to have been for some time eminently successful, both economically and in its moral influences, and to have failed only in consequence of the proprietor's financial ruin and flight to America, caused by his gambling propensities. The book is mainly a narrative of facts, written in a lively and readable style, and the story told in it certainly deserves attention from all who take a practical interest in improving the condition of the agricultural population. The Ralahine system did not conform to any standard type. It might be called a modification of the *métairie* system (see MÉTAYAGE), the tenants paying to the landlord not a fixed *proportion* of the produce, but a fixed amount. Pare was one of Owen's literary executors, and, at the time of his death, was preparing a life of him from the large collection of letters and other documents which he had in his hands.

[Holyoake's *Hist. of Co-operation*, vol. i. pp. 86, 89, 145, 282, 358, and his *Sixty Years of an Agitator's Life*, vol. i. p. 40.—E. T. Craig, *History of Ralahine* (London), 1882, pp. 158, 161. *Inter*

alia, Owen's Labour notes were tried there (p. 75, etc.), (see LABOUR EXCHANGE). Also an article partly founded on family information, in the *Dictionary of National Biography*.] J. E. I.

PARIEU, FELIX ESQUIROU DE (1815-1893), was born at Aurillac, and died in Paris. As an economist his name is particularly connected with two questions — the INCOME TAX and MONOMETALLISM, on both which he displayed great erudition supported by remarkable literary talent. After having practised with distinction as a lawyer at Riom, he was elected by the department of the Cantal in April 1848 to the national constituent assembly. He succeeded in attracting attention there by his intelligence in economic questions. He was directed to draw up in the name of a parliamentary commission, 1st September 1848, a report on a plan for a progressive tax on successions and donations, including any DONATIO MORTIS CAUSA; and in his report he substituted the principle of proportionality for that of progression. On the 30th of the same month he made another report on the income tax. The minister of finance had proposed a tax levied by assessment (*Impôt de répartition*) of 60,000,000 francs (say £2,400,000). M. de Parieu transformed this into a tax levied by a percentage of 3 per cent (*Impôt de quotité de 3 per cent*). This tax applied to all personal property, even to income derived from the funds; it was not, however, proposed as a single tax, as it was to take its place by the side of other taxes.

These two proposed bills came to nothing; but they had at least the useful result that they impelled De Parieu to publish first the *Histoire des impôts généraux sur la propriété et le revenu*, 8vo, 1856, and then the *Traité des impôts considérés sous le rapport historique, économique et politique en France et à l'étranger*. which last went through two editions, the 1st in 5 vols. 8vo (1862-64), the 2nd in 4 vols. 8vo (1866-67). These two works, now out of print, have taken their place as classic. The first won for the author admission to the Institut (*Académie des Sciences morales et politiques*) in 1856. The question of monometallism on gold succeeded in his thoughts to that of the income tax. In 1857 he, almost alone, proposed the 25-franc piece, and gold as the standard. The object that henceforth he aimed at was the subordination of silver to gold and the establishment in all countries of gold monies of the same weight and value. As a politician M. de Parieu was a member of the constituent and legislative assembly of 1848, minister of public education from October 1849 to June 1851; member of the council of state, 1852-55; vice-president of this council, 1855-70; minister president of the council of state in the cabinet of Olivier; a member of the national assembly; then, after the Franco-German war, a senator until 1884.

A short time before the fall of the second empire De Parieu published an argumentative work: *Principes de la Science Politique*, 8vo. Pure democracy, that is to say the republic, does not figure in this work as the ideal of the author who, it should be remembered, approved though he did not take part in the *coup d'état* of 2nd December 1851. A. C. f.

PÂRIS-DUVERNEY, JOSEPH (died 1770), born at Moras near Grenoble, died near Château Thierry, was the third in order of birth of the four brothers Pâris, and first in that of capacity. The eldest, Antoine Pâris, was guardian of the royal treasury, an office from which he retired in 1730 in favour of his youngest brother Jacques Pâris de Montmartel. The second of the brothers called himself Pâris de la Montagne, from the sign (*à la Montagne*) of the inn his father kept. The father, who himself possessed considerable ability, established each of his sons in a vocation requiring first-rate business capacity. During the last years of the reign of Louis XIV., the brothers Pâris, who always lived together on the most affectionate terms, undertook the commissariat service for the forces stationed in Flanders and on the Italian frontier. They themselves, no doubt, obtained great profits from this, while by their good administration, the promptitude of their decisions, and their intelligent forethought, they were enabled to render great services to the armies.

Under the regency, the committee of finance, presided over by the Duc de Noailles, accepted favourably (1716) the financial plans of Pâris-Duverney, which for some time counterbalanced the growing influence of LAW, by arranging in shares the lease of the farm of the taxes (see FARMER GENERAL) which they had secured by contract at an annual payment of 48½ millions. This enterprise, a rival to that of the Scotch financier, was called by the people *Anti-Système*.

Law, by his influence, succeeded in annulling the lease of the farm of the taxes, which he undertook at the rate of 52 millions. The brothers Pâris then fell into disgrace and were even exiled from their native country so long as the SYSTÈME lasted. When Law sank, the real minister of finance was Pâris-Duverney, the official controllers-general continuing only for the sake of appearances. It was Pâris-Duverney who broke with the *Système*, and established that enormous operation, the VISA, which examined into the private property of more than 500,000 persons who had more or less had a share in the transactions of the *Système*.

It must be admitted that the energy of the rival of Law sometimes went too far, betraying him even into arbitrary acts, but his reputation of honesty never suffered. Pâris-Duverney was reproached for having too systematically opposed the ideas of the author of the *Système*.

When Cardinal de Fleury attained power, the brothers Pâris again fell into disgrace; Pâris-Duverney was even imprisoned in the Bastille for two years (1727-28). Justice, however, was done him in the end, when it was found that there were no grounds whatever for the charge brought against him.

Pâris-Duverney left many works in manuscript which have never been printed. This is a real loss considering their subjects, and that they are the work of so eminent a financier.

The list of his works according to Luchet is: *Traité des monnaies de France depuis le commencement de la monarchie jusqu'au 1er Janvier 1724.—Traité des domaines du roi depuis leur origine jusqu'au 1er Janvier 1725.—Traité des gabelles de France depuis leur commencement jusqu'au 1er Janvier 1726.— Traité des rentes depuis François 1er jusqu'à l'année 1725.— Traité des colonies françaises et de leur commerce depuis leur fondation jusqu'à l'année 1723.—Traité des changes créés ou supprimés depuis 1689 jusqu'au 1er Décembre 1721.—Dépouillement des droits existants sur les marchandises contenus dans le tarif de 1664 jusqu'à l'an 1726, avec les variations arrivées sur chaque espèce.*

A remarkable book has been attributed to him, *Examen du livre intitulé: Réflexions politiques sur les finances et le commerce par Dutot*, 1740, 2 vols. 12mo, a review of the principle and effects of the *Système*. The warmth with which the writer defends the *Visa* is thought to show that he was the author of it.

The different operations of Law's scheme "are explained so fully, so clearly, and with so much order and distinctness, by Mr. Du-Verney, in his 'Examination of the Political Reflections upon Commerce and Finances of Mr. Du Tot,' that I shall not give any account of them" (Adam Smith, *Wealth of Nations*, bk. ii. ch. ii. p. 139, ed. M'C.). The *Examen* is also referred to in bk. ii. ch. iii. and in bk. v. ch. iii. p. 414.

[A very interesting life of Pâris-Duverney is contained in a little volume attributed to M. de Luchet, *Histoires des Messieurs Pâris*, 1776, 12mo. See also *Dict. de l'écon. politique.*] A. C. f.

PARISH. The importance of the parish for civil purposes dates from the Tudor period. Originally the smallest administrative unit was the township, upon which the ecclesiastical parish was usually modelled. With the rise of feudalism the TOWNSHIP was transformed into the MANOR. But in the 16th century the manorial system had decayed, whilst the ecclesiastical organisation of the parish was in full vigour. The churchwardens took care of the church fabric, and the vestry or assembly of householders met in the church under the presidency of the incumbent. Under Henry VIII. the churchwardens were charged with the relief of the poor. The poor law of Elizabeth, passed in 1601, directed that two justices of the peace dwelling in or near the parish should appoint overseers of the poor, who were to act with the churchwardens in this business. An act of Philip and Mary laid upon the parish the maintenance of highways, and created the office of parish surveyor. During three centuries the parish continued to be, under the county and the corporate town, the most important administrative subdivision. But it proved unsatisfactory, especially for the purposes of poor relief. Accordingly, the new poor law of 1834 created unions of parishes and transferred to them the relief of the poor. Subsequent legislation made similar changes with reference to public health and to highways. Thus the parish came to be little more than a constituent unit of the union, and a district for the collection of rates and the preparation of jury lists and parliamentary and municipal registers. An attempt to reform the larger parishes was made in 1831. Hobhouse's Act enabled parishes with 800 rated householders and upwards to choose a select vestry. Alike in the meetings of the common vestry and in the election of the select vestry the plural vote was admitted, and a large ratepayer might have as many as six votes. The incumbent was *ex officio* chairman in the select as well as in the common vestry, and the churchwardens still had equal powers with the overseers. Thus the ecclesiastical and the civil administration of the parish were still united. But the ecclesiastical and the poor-law parish did not always coincide, owing to the frequent subdivision of the ecclesiastical parish in recent times. There are in England about 15,000 poor-law parishes, varying greatly in extent and population. The majority have from 300 to 1000 inhabitants, but many have less than 50.

The Local Government Act 1894 (56 & 57 Vict. c. 73) has made a parochial revolution. Its principal objects were (1) to separate the civil from the ecclesiastical organisation of the parish; (2) to render the constitution of the parish absolutely democratic; (3) to enlarge considerably the powers of the parochial authority. The act applies to all parishes not included in the metropolis, in a corporate town, or in a local board district. The parish is defined as a place for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed. The act provides that every rural poor-law parish, having a population of 300 or upwards, shall have a parish council. Parishes with less than 300 inhabitants may have councils if the inhabitants wish and the county council approves. Otherwise they may be grouped with neighbouring parishes. Every parish to which the act applies is to have a parish meeting. The parish meeting consists of all persons on the local government register or parliamentary register, who each have one vote and no more. It assembles at least once a year, and elects the parish council if there is one. Where there is no parish council, the parish meeting has all the powers of the former vestry. It has

power to adopt certain acts relating to baths and washhouses, recreation grounds, free libraries, etc.; to sanction the sale or exchange of parish property, and to incur any expense not involving a loan or a rate of more than 3d. in the pound. It must appoint a chairman, and may appoint a committee to transact routine business.

The parish council is to be elected annually at a parish meeting. Any person having a vote in the parish meeting, and any person who has resided twelve months in the parish, is eligible as a councillor. Each elector has one vote for each of the number of persons to be elected. The number of councillors is to be fixed by the county council, but must not be less than five or more than fifteen. The council must elect a chairman who will hold office for the year. It is a body corporate, and has power to hold lands without license in mortmain. The parish council is to take over all the powers formerly exercised by the vestry, except those relating to church business, and the powers of boards of guardians with respect to allotments and small holdings. It has power to acquire land for public buildings, recreation grounds, allotments, etc. If it fails to obtain land for any of these purposes, it may petition the county council, which may make an order compelling owners to sell the land required. If the county council refuse to make an order, the parish council may petition the Local Government Board. If any owner feels aggrieved by an order of the county council, he may present a memorial to the Local Government Board. In either case, the Local Government Board will institute a local inquiry, and make such an order as it thinks fit, which will be final. No additional allowance is to be made for compulsory purchase. The parish council has, subject to similar qualifications, a power of hiring land compulsorily for allotments. It has also extensive powers with respect to parochial charities other than ecclesiastical. It may not enter on expenditure which will involve a loan or a rate exceeding 6d. in the pound, without the sanction of the county council. The position of the former officers of the parish is changed by the act. The incumbent and the churchwardens are now deprived of all authority except in church business. The overseers, formerly appointed by the justices, are now to be appointed by the parish council. Some of their functions are transferred to the council itself.

PARITY OF VALUE. A term used for a variable par as between gold and silver exchanges. In the Indian exchanges, so long as the mints were open, the value of the rupee was $\frac{1}{144}$ of the price of an ounce of standard silver, *plus* about 3 per cent for charges, and the parity was found by multiplying the day's price by ·383. The mints being closed, the rupee becomes a protected monopoly, and its value is a matter of negotiation.

Calculations as to parity are also required in bullion transactions between London and various foreign markets. In London, quotations for gold and silver are always for standard fineness —*i.e.* 916·6, and 925 respectively. In Paris and Berlin both metals are quoted fine; in New York gold is quoted for 900, and silver for 999 fine. R. W. B.

PARK. See FORESTS, MEDIÆVAL.

PARK, JAMES ALAN (1763-1838), English judge, was called to the bar in 1784.

In 1816, Park was appointed a judge of the court of common pleas. He published (1787) his *Law of Marine Insurance*, a standard work, which passed through many editions, and was written under the direct encouragement of Lord Mansfield.

[*Biographical Dictionary of English Judges*, by E. Foss.] H. E. E.

PARKER, HENRY (1604-1651), barrister-at-law, was the author of twenty-four political pamphlets on the popular side (1640-47, 1650-51), of one on *Reformation in Courts and cases testamentary* (1650), and of one, *Of a Free Trade, a discourse seriously recommending to our nation the wonderful benefits of trade, especially of a rightly governed and ordered trade, setting forth also most clearly the relative nature, degrees, and qualifications of libertie which is ever to be enlarged or restrained according to that good which it relates to as that is more or less ample* (1648). The latter was written during his sojourn at Hamburg (1647-49) (*Gentleman's Magazine*, xxxv. 109) as secretary to the Merchant Adventurers there (*Cal. of State Papers, Dom. Ser.*, 1649-50, p. 34). It is a defence of the privileges of the Merchant Adventurers against the attacks of "free traders," like Brent, in his *Discourse consisting of motives for the enlargement of freedom of Trade* (1645), and VIOLET, in his *Advancement of Merchandise* (1651, pp. 10-12), and reads like a clever abridgment of J. WHEELER'S *Treatise on Commerce* (1601). He attacks INTERLOPERS (individual merchants) and "pedlars" (retail traders), and although, like Wheeler (*l.c.* p. 101 *et seq.*) he repudiates the charge that his company is a monopolist, he defends "stinting" (limiting exports); the practice of selling at Hamburg and Antwerp only, and only on certain days; apprenticeship, etc.; and advocates more "reglement of trade" on the usual ground that trade would become "overstocked," "confused," and "straggling," and would very soon die unless it was "well ordered."

Order, he thinks, will prove an economy, and pruning will promote trade; and trade magnifies a nation more than war does. Like war, trade is an outcome of men's "wolvish" instincts which when pressed into the service of the state are turned into virtues (pp. 18, 19). RALEGH'S

ideal of the state merchant, and envy and praise of Holland, are always present to his imagination; and he praises his company for its religion, law, charity, navy, and diplomacy rather than its wealth. He is more of a politician than an economist. Indeed his views on wealth are indistinct. In an age when MADDISON (*England's looking in and out*, 1640), Battie (*Merchant's Remonstrance*, 1648), and ROBINSON (*Proposals in order to the People's Freedom*, 1652) dinned into willing ears that trade only enriches if there are net exports which bring in money; and when POTTER modified this theory by his doctrine that money is a mere security for obtaining "things of real value" (*Key of Wealth*, 1650); and Maddison (*l.c.* p. 11), L. ROBERTS (*Treasure of Traffike*, 1641, p. 22), and Φιλόπατρις (*The Advocate*, 1651, p. 13) undermined the application of the theory by urging that "no lawes are prevalent against gain," Parker wrote: "Exports conduce perhaps more to profit, and things imported to securance; yet . . . both . . . conduce to both. Native commodities more immediately afford us treasure: and forrain commodities are more usually materials for shipping, etc., . . . yet sometimes we retayle the same to strangers for gain" ("profit" and "gain" mean money), a sentence to which neither MISSELDEN nor MALYNES could have objected. He clearly wishes to face both ways. J. D. R.

PARLIAMENT, ROLLS OF. This name has been given to the ancient records of the proceedings of parliament kept by the clerks of the chancery. They extend from the sixth year of Edward I. to the nineteenth year of Henry VII. 1278-1503 A.D. In later times their place has been supplied by the journals of the two Houses. The journals of the House of Lords began in the first year of Henry VIII. 1509 A.D., and the journals of the House of Commons in the first year of Edward VI. 1547 A.D. In 1832, the Rolls of Parliament were published in six volumes, folio, under the title *Rotuli Parliamentorum ut et Petitiones et Placita in Parliamento.* F. C. M.

PARNELL, HENRY BROOKE (1776-1842), afterwards first Baron Congleton, the son of Sir John Parnell, was educated at Eton and Cambridge, which he left without taking a degree, and entered the Irish parliament as member for Maryborough in 1797. In 1802 he represented Queen's County in the first parliament of the United Kingdom, and soon, either through natural leaning or some force of circumstances, began to associate himself with movements of an economic character. On 18th April 1809 he introduced a resolution for assimilating IRISH CURRENCY (*q.v.*) to that of the rest of the United Kingdom. On 19th Feb. 1810 he became a member of the BULLION COMMITTEE. He was chairman of the select committee of 1813 to inquire into the corn trade of the United Kingdom. In July 1819 he brought forward serious retrenchment resolutions; he had somewhat severe ideas of public economy, and when he became secretary at war, 4th April 1831, made such a point of reducing the army estimates, that his colleagues had to part with him, and he relinquished his office in 1832. Nevertheless he returned to office under Lord Melbourne on 14th May 1835, as paymaster-general. He committed suicide in 1842.

His best-known work is that on *Financial Reform*, London, 1830. His main contention is that the public expenditure was overgrown, and that, especially in the non-productive services, considerable reductions could be effected. Of his other economic works the principal were, *Observations on the State of the Currency in Ireland*, Dublin, 1804.—*Principles of Currency and Exchange, illustrated by observations on the State of Ireland*, Dublin, 1805.—*A Treatise on the Corn Laws and Agriculture*, London, 1809.—*Observations on the Irish Butter Acts*, London, 1825.—*Observations on Paper Money, Banking, and Overtrading*, London, 1827.—*A plain statement of the Power of the Bank of England and the use it has made of it* (published anonymously), 1832.—*A Treatise on Roads*, London, 1833.

[*Dictionary of National Biography.*] C. A. H.

PARQUET (Fr. an enclosure). On public bourses the railed-in space within which the privileged brokers or *agents de change* (see CHANGE, AGENTS DE) carry on their operations; the word is also employed to distinguish the official market from the outside market or COULISSE (*q.v.*). By extension the two words are applied to the business itself, for example, "the *parquet* was weak, the *coulisse* firm," many securities being dealt in on both. In legal phraseology the *parquet* is the office of the public prosecutor in the law courts, or the officers appointed by the minister of justice to set in motion the action of the law in criminal affairs or in civil proceedings when they are matters of public policy. PARTICULAR AVERAGE. The losses provided against by marine insurances are "total loss" and "partial loss."

Partial loss is either a "*general average loss*" or a "*particular average loss.*" *Total loss* is either *actual* or *constructive.* When the subject matter is destroyed or irreparably damaged, or when the assured is irretrievably deprived thereof, there is an "*actual total loss*" (Marine Insurance Bill, § 57 [1]). A "*constructive total loss*" is, on the other hand, said to arise (*a*) in the case of a ship, when the insured ship is so damaged that the expense of repair would exceed the value of the ship when repaired; (*b*) in any other case, when the subject matter is so damaged, or affected by a peril insured against, that, having regard to cost, it is not reasonable to require the adventure to be prosecuted to its termination (Marine Insurance Bill, § 60).

General average arises whenever part of the cargo is sacrificed, or some expenditure is incurred

for the benefit of the ship and cargo generally, *e.g.* when goods are thrown overboard for the purpose of lightening the ship. The value of the lost goods or the amount of the expenditure is, in such a case, made up to the person concerned by contributions payable by the owners of the ship and cargo in proportion to the value of their respective interests, and they in their turn, if the insurance covers general average, are reimbursed by the underwriters. A "*particular average loss*," on the other hand, is a partial loss which falls on the owner of the goods affected by it exclusively (*e.g.* damage done to goods by sea-water is a particular average loss, unless the goods are so badly damaged that a case of "total loss" arises, in which event the goods are handed over to the underwriters, and the assured receives the full amount of the insurance).

In many cases it is doubtful whether a total loss may be claimed for, or whether there is only a claim for compensation under the head of particular average.

If the claim is made in respect of "constructive" total loss, notice of abandonment must be given within the usual time, and the underwriters have then to determine whether they will admit or contest the claim, and in the event of the parties not being able to agree, the question must be decided by arbitration or litigation.

A policy drawn up in the ordinary form contains the following clauses :—

"(*a*) Corn, fish, salt, fruit, flour, and seed are warranted *free from average*, unless general, or th ship be stranded.

(*b*) Sugar, tobacco, hemp, flax, hides, and skins are warranted *free from average under £5 per cent.* And also—

(*c*) All other goods, also the ship and freight, are warranted *free from average under £3 per cent.* unless the ship be stranded."

This means that, except in so far as the common-form policy is varied by special agreement, the underwriters do not insure the goods mentioned under (*a*) against particular average in ordinary cases, but that if the ship be stranded, particular average is insured against; that the goods mentioned under (*b*) are not insured against particular average unless it diminishes the value of the goods to an extent exceeding 5 per cent of the insured value; and that all goods not mentioned under (*a*) and (*b*) are insured against particular average diminishing their value to an extent exceeding 3 per cent, and against particular average of any sort arising in the event of the ship being stranded. In modern commercial usage an insurance which covers total loss, general and particular average is called an insurance "against all risks," and an insurance against total loss and general average only is called f. p. a. (free of particular average).

[Smith, *Mercantile Law*, ed. by Macdonell, 10th edition, 1890.—Gow, W., *Marine Insurance*, Macmillan, 1893; and see the Marine Insurance Bill, intended to codify the law of marine insurance.] E. S.

PARTICULAR ESTATE. A particular estate (Lat. *particula*, a small portion) signifies a limited interest in lands or tenements, an interest less than the fee simple estate, which is the largest interest that an English subject can have in land. An estate for life is an example of a particular estate.

PARTNERSHIP.

Partnership, History of, p. 65, Partnership, Canonist Theory, p. 68; Partnership, Form of, as Commandite p. 68; Partnership, Industrial, p. 69; Partnership, Law of, p. 69; Partnership, Mediæval, p. 71.

PARTNERSHIP, History of. Sir Henry Maine's statement, *Ancient Law*, p. 170, that the progress of society leads to the substitution of contractual relations for relations imposed by those natural and legal conditions affecting individuals which are known under the name of *status*, is borne out by the history of the law of partnership. Some form of association for economic purposes seems to have existed in very remote times. Tablets inscribed with cuneiform characters have been discovered which show that associations established for mercantile purposes and trading, under a kind of trade-name, existed in Assyria more than twenty centuries before the present era, and the principle of uniting funds for common objects was well known in ancient Greece. Gaius refers to a law of Solon (see Justinian's *Digest*, 47, 22, 4), in which the objects are named for which autonomous societies existed. They include trade (εἰς ἐμπορίαν) as well as the less creditable occupation of piracy (ἐπὶ λείαν ὀιχόμενοι).

There is also a well-known passage in Aristotle (*Eth. Nic.* viii. 11), in which such associations (κοινωνίαι) for a common object are mentioned, the object being either the prosecution of gain or some convivial or domestic purpose such as the sharing of meals, the members in that case being called σύσσιτοι, and a certain class of societies known as ἔρανοι are referred to by some of the Attic orators (see Meier and Schömann's *Attischer Prozess*, edited by Lipsius, 1883-1887, pp. 637-643). Information about oriental and Greek partnerships is, however, too scanty to enable us to form an opinion as to their origin and history.

It is only when we proceed to examine the legal history of the Roman republic and empire that more reliable data are discovered, and from these it is clear that the Roman *Societas* in its original form was not the result of contract, but of natural ties. Roman family relations must always be looked on from two aspects. The "agnatic" family is an economic unit under the authority of a head, in whom the property is vested and under whose *potestas* all the members of the family are placed. Emancipated sons and married daughters brought under another man's *potestas* cease to belong to the agnatic family. On the other hand, the "cognatic" family comprises all the children, and their issue without reference to *potestas;* it is not a unit for economic purposes, but its

members are held together by various ties, one being the respect, *obsequium*, due to the common ancestor.

Thus it comes that even after the death of the father, brothers and sisters are held together; they remain members of the cognatic family which is called the *secta*, a word derived from the same root as *obsequium* and *exsequiae* —which latter expression denotes the funeral rites which the cognatic family had to attend to, on the ancestor's death—and is also etymologically connected with *societas*, and as the father's estate was generally bequeathed to them as tenants in common (though the right of the cognates to inherit was established at a later period only), they frequently found it convenient not to divide the property, but to administer it for their common advantage. When property was left to several persons as tenants in common, the individual shares were generally ascertained by lot; hence the Greek word for inheritance is κληρονομία = that which is ascertained by lot; the division by lot is also indicated in the Latin word *consortium*, but that word also shows that it was customary to keep the parts together. Thus brothers and sisters who, having in their father's lifetime been members of the same *secta* or *societas*, were also called *socii*, frequently kept the inherited property together, and used or traded with it for their common advantage.

Another instance of common ownership under the name of *societas* is also of importance in connection with our subject. In the same way as the emancipated children were bound together by the common tie of *obsequium*, the slave who had received his freedom owed this *obsequium* to his former master. One of the ways to enforce this duty was to impose the condition that, on its being neglected, the master should be entitled to a share in the freedman's goods, which in that event were held in common by the *patronus* and *libertus* in the same way as inherited property was held in common by the *fraternum consortium;* the name *societas*, which, as shown above, was derived from the family relation, was also applied to this relation, which was one of contractual partnership.

But the voluntary association of several persons to carry on business on joint account was not immediately evolved out of the types of association to which we have referred. A third class of *societas* began to be formed at the time of the second Punic War for the purpose of contracting for the supplies to be furnished to the Roman army (see Livius, xxiii. 48 (539)), and the societies who farmed the state revenues, *vectigalium publicorum socii*, were also organised on a similar plan. These societies, known by the collective name of *societates publicanorum*, had corporate rights, and differed therefore from partnerships in the ordinary sense, but they no doubt called attention to the possibility of joining funds for purposes of profit.—For fuller information on the early history of partnerships and trading societies in Rome, see Leist, *Geschichte der Römischen Societas*, from which work the information given above is mainly derived.

There were therefore two kinds of association known during the times of the Roman republic: the one resulting from natural ties, being either the *fraternum consortium* or the common ownership in the goods of a freedman who had neglected the *obsequium* due to his *patronus;* the other resulting from voluntary association for purposes of gain, but being more like a trading corporation than like a partnership. During the classical period of Rome, which began soon after the foundation of the empire, associations began to be formed of a private nature, and partaking of many legal characteristics of the ancient family societies, but entirely voluntary, and established for purposes of gain like the above-mentioned trading corporations. At this later stage all partnerships were the result of contract, and we see from an enumeration made by Ulpian (about 200 A.D.) that they referred either to the whole of the present and future property of the partners, *societates omnium bonorum*, or were entered upon for some particular transaction, *negotiationis alicujus*, or for farming taxes, or for the joint management of one particular object of property, *societates unius rei* (see Justinian's *Dig.* 17, 2, 5). Paulus, one of Ulpian's contemporaries, gives an instance of a professional partnership ("duo societatem coierunt ut grammaticam docerent et quod ex eo artificio quaestus fecissent, commune eorum esset," *Dig.* 17, 2, 71). The legal characteristics of private partnerships as distinguished from trading corporations are at that time clearly recognised (see the quotation from Pomponius, *Dig.* 17, 2, 59, and see also *Dig.* 3, 4, 1, pr.), and it is also pointed out by the jurists of that period that not all the partners need necessarily contribute capital, as a partner's work may entitle him to a share of the profits ("saepe enim opera alicujus pro pecunia valet" Gaius, iii. § 149, see also *Dig.* 17, 2, 5, § 1). Much attention was already given to the details of partnership arrangements, such as the division of profits and losses (*Inst.* 3, 25, § 1, § 2 i; Gaius, iii. §§ 149, 150; *Dig.* 17, 2, 29, § 2 i; *ibid.* 17, 2, 30), the degree of diligence required from partners (*Dig.* 17, 2, 72), and the events which cause a partnership to be dissolved (*Inst.* 3, 25, § 5, i; *Dig.* 17, 2, 65, §§ 3, 5; *ibid* 17, 2, 70). Even minute points, such as the question whether a partner who is wounded in trying to protect the partnership property is entitled to recover his medical expenses from the partnership (see *Dig.* 17, 2, 60, and 61), are discussed with great elaboration. It must, however, be pointed out that, notwithstanding many similarities, the partnership of the classical as well as of the earlier periods of Roman law

is essentially different from the partnership of our days. No broad distinction is drawn in Roman law between common ownership of property and the mere sharing of profits and losses; nor are permanent trading associations distinguished from occasional transactions on joint account. There is no partnership capital kept distinct from the capital of the partners, and no general rule exists according to which a partner has authority to incur liabilities binding his co-partners. Even when he is specially authorised to incur a liability on their behalf, it is doubtful to what extent they are liable (see Windscheid, *Pandekten*, 5th ed. ii. § 407, note 7). In many ways the rules still partake of the character belonging to the older associations between members of the same family, and the influence of the greater freedom of intercourse brought about by the extension of the empire and the increase of wealth is not yet sufficiently felt. The principal reason for this fact is to be found in the continued existence of slavery, which took away many of the motives which in our days induce traders to form partnerships.

A very convenient method of trading was furnished through the instrumentality of the *peculium*, being the property put into the hands of a non-emancipated son, or of a slave, for purposes of trade. The creditors of such son or slave were under the praetor's edict entitled to sue the head of the family in respect of the trade-debts, but the judgment could be enforced only in so far as the judgment debt did not exceed the value of the *peculium* (see the title *De Peculio*, *Digest* xvi.). This rule enabled a master to trade with limited liability through the agency of his slave. It was also possible for several masters to become co-owners of a slave, and carry on a trade in co-partnership through his agency. Each partner was then liable for the trade-debts to the extent of the whole *peculium*, but he was entitled to claim contribution from his co-partners to the extent of the sums which represented their shares (see *Digest* xv., 1, 27, 8). This method of trading with limited liability was not the only one known in Roman law (see Goldschmidt, *Universalgeschichte des Handelsrechts*, vol. i. p. 91), and the entrusting money to others for trade purposes, which frequently brought about a similar relation, was in the language of later latinity called *commendare* (from *cum-mandare*, mandare being derived from manui dare; as to the mediæval applications of the word, see Ducange, *Glossarium*). The form of partnership known as *commenda* in mediæval law was therefore known already by the same name in earlier times.

When the mercantile cities of Italy—among which Venice, Pisa, and Genoa began in the 9th century to be prosperous—established a large maritime trade, the *commenda* (viz. the relationship in which there is an active partner liable without limit, and a capitalist partner whose risk is limited to a fixed sum) became a favourite form of association. It was in the beginning merely of a temporary nature, and used by capitalists who wanted to join in some particular maritime enterprise with a limited risk, but in course of time it was also applied to internal trade, and more permanent relations between the capitalists and active traders became customary. Thus the large financial houses of the Bardi and Peruzzi in Florence, who lent 1,365,000 gold florins to Edward III., traded as to part only with their own money, whilst the bulk of their capital was furnished by commandite partners and depositors, *avcano in accommanda ed in deposito di piu cittadini e forestieri* (Villani, quoted by Troplong, *Traité de la Société*, vol. i. p. 66).

Thus the prototype of the modern *société en commandite* was in the early part of the middle ages the most important form of association, but the partnership of modern times, in which all partners are liable without limit for the partnership debts, traces its pedigree from more humble progenitors. Like the Roman *Societas*, it originated in the family community in which a small trade or handicraft was carried on by the persons eating their bread together (*cum-panes*=σύσσιτοι, from which word the expressions *Company* and *Compagnon* are derived). The trade of these family associations was carried on in a common workshop, or warehouse, known by some well-known sign which was used as a comprehensive designation of the persons using it as the centre of their operations. Hence arose the use of firm names, and the personification of the mercantile unit, represented by the sign of the house, as well as the custom to recognise every partner as agent for the partnership.

The names of the partners were entered in the books of the guilds representing the trade to which they belonged, which guild registers served as the foundation of the registers of firms in use in most continental countries. In these partnerships, for the first time, the partnership capital, which—in connection with the original character of the joint establishment, was looked on as a common fund not accessible for the partners' private purposes—was kept strictly separate from the separate capital of the partners. Originally only the partnership capital was liable for the partnership debts, and it was only gradually that the unlimited liability of the partners' separate capital became customary. (For further particulars of the development see Goldschmidt, *l.c.* pp. 271-290). The custom of trading under a firm, and with a partnership capital, was subsequently also adopted by voluntary associations not bound together by any family tie, and partnerships trading with unlimited liability began in the 16th century

to assume the same importance as the commandite partnerships, which in the early parts of the middle ages had monopolised all other branches of trade (see Goldschmidt, *op. cit.* pp. 289-290; on the whole development, see also Lastig, "Allgemeine Uebersicht," in Endemann's *Handbuch*, pp. 329-332, and the authorities there cited).

Thus it came about that, like in ancient Rome, the partnership formed by natural ties and founded on *Status*, preceded and established the characteristics for contractual partnerships.

The development of trade finally produced the third type of mercantile association, which we also noticed in the Roman development. Companies enjoying corporate rights, and trading with a capital divided into shares—which shares, unlike shares in ordinary partnerships or commandite partnerships, were transferable by contract and transmissible on death,—existed in Italy at a very early period under the name of *monte* (the expressions *massa* and *maona* are also used). They are associations of capitalists who advanced funds to governments, and in return received certain trade privileges. The oldest of these associations was established for temporary purposes only, but in 1346 the Genoese *maona* of Chios and Phokaea, also known as *Maona dei Giustinini*, received a more permanent organisation. In return for a loan required by the city of Genoa for an expedition undertaken by Simon Vignos and others, the exploitation of Chios and Phokaea was entrusted to this company under the suzerainty of the Genoese state; they also obtained important trade monopolies, and the company continued to have an independent existence until 1513, when it was purchased by the well-known *Monte delle compere e dei banchi di S. Giorgio* of Genoa, the first fully organised banking company, which was founded in 1407, and continued to exist until the extinction of the republic of Genoa (see Goldschmidt, *op. cit.* pp. 295-297).

In England the ground for the trading companies was prepared by the merchant adventurers (see ADVENTURERS, MERCHANTS; COMPANIES, STAPLE), and companies similar to the Italian companies, mentioned above, are to be found regularly from the middle of the 16th century, but the establishment of companies with permanent objects is of a somewhat later date. The EAST INDIA COMPANY (*q.v.*), founded in 1600, is one of the earliest English permanent companies. These companies were all incorporated by royal charter, and the possibility of acquiring corporate rights by virtue of a general act was established during the present reign only.

S.

PARTNERSHIP, CANONIST THEORY. The phenomena of business partnership (SOCIETAS) presented themselves for judgment before the schoolmen and canonists of the middle ages, chiefly in their relation to the theory of usury (see INTEREST AND USURY). A partnership wherein each member shared in the management of the business raised no difficulties: the profit (*lucrum*) might in such a case be regarded as the reward of labour. Not only so, but a partnership in which some of the members contributed capital only, without labour, and yet expected profit, was regarded as equally allowable,—on one condition, viz. that the investor really "adventured," *i.e.* really shared in the "risk," both as regards the sum invested and the gain to be derived from it. The running of risk was held both to furnish an ethical justification for gain, and also to prove that the investor remained the *owner* of the sum invested, so that the contract was clearly distinguishable from one of LOAN (*q.v.*) or MUTUUM, in which the ownership of the money was held to pass over to the recipient. Any attempt by subsidiary contracts to assure the investor against the loss of his capital, or to guarantee a profit independent of the chances of trade, brought the arrangement within the scope of the prohibition of usury.

[The passage in AQUINAS, *Summa Theologica*, Secunda Secundæ, Qu. 78, Art. 2, was the starting point of subsequent discussion. A very elaborate treatment of *Sozietät* will be found in the first vol. of W. Endemann's *Studien in der romanisch-kanonistischen Wirthschafts- und Rechtslehre* (1874); on which, with some attempt to correct its bias, is based the account in Ashley, *Economic History*, vol. i. pt. ii. (Amer. ed. vol. ii.) pp. 419, 420. (See also PARTNERSHIP, MEDIÆVAL.)] W. J. A.

PARTNERSHIP, FORM OF, AS COMMANDITE. A partner is as a rule liable jointly with his co-partners for all debts of the firm; and after his death his estate is liable for such debts subject to the prior payment of his private debts.

It has been thought desirable to introduce forms of partnership in which a person might contribute capital and receive a share of the

profits without at the same time incurring unlimited liability towards creditors. The Partnership Act of 1890, embodying the provisions of "Bovill's Act" passed in 1865, recognises this principle, and states that the receipt of a share of the profit of a business or of a payment contingent on or varying with the profits, does not of itself make such person a partner. But whilst these provisions only relate to private arrangements, which may at any time be altered or cancelled between the parties, subject however to the restriction that, in the event of bankruptcy, a person entitled to a share of profits, but not being a partner, cannot prove in competition with other creditors, the form of partnership known as "Limited Partnership" and *société en commandite*, and used in most mercantile countries, including the United States, gives effect to the principle referred to in a much more consistent manner. In a commandite partnership, there are one or more partners managing the affairs of the firm, and liable to an unlimited extent, who are called "general partners," and one or more dormant partners, who are called "special partners" (*commanditaires*), who are only liable to a limited extent. The amount for which they are liable, and the time during which the liability continues, must be registered and published, and no arrangement between the partners varying the registered agreement can affect the creditors of the partnership.

Owing to the spread of limited *Companies*, commandite partnerships have in all countries come very much into disuse, and the fact that the provisions of the British Companies Act 1867, § 4, which allows limited companies to be formed in which the managers or directors are liable to an unlimited extent, have remained a dead letter, shows that in British countries there is no real demand for "commandite" partnerships.

[See *Revised Statutes of the State of New York*, pt. ii. ch. iv. title 1.—*French Code de Comm.*, §§ 23, 28, German *M.C.*, §§ 150-206, Italian *M.C.*, §§ 114-120; Spanish *M.C.*, §§ 145-150; Portug. *M.C.*, §§ 104, 113, 114, and other *Mercantile Codes*.] J. E. C. M.

PARTNERSHIP, INDUSTRIAL. See PROFIT SHARING.

PARTNERSHIP (LAW OF).[1] Partnership in the widest sense means every association for common purposes, and in a somewhat narrower but still comprehensive application, it means every association for purposes of gain. In the strictly legal sense the word is, however, of more limited import. In all countries partnerships are distinguished from incorporated *companies* (see COMPANIES; JOINT-STOCK COMPANIES; STANNARIES). Subject to that exception, a partnership in the United Kingdom, as well as in such parts of the British empire in which the P. A. has come into force, is defined to be in (§ 1) as "the relation which subsists between persons carrying on a business in common with a view of profit," the word "business" including, according to the definition given by § 45 of the same act, "every trade, occupation, or profession."

English law does not distinguish between mercantile and other partnerships, as some of the continental codes do, in which non-mercantile partnerships are governed by rules differing in many important respects from the rules governing mercantile partnerships. This is more especially the case with reference to the liability for the partnership debts, which in the case of mercantile partnerships extends to the whole debts for each partner, whilst in the case of non-mercantile partnerships the partners are liable in equal shares, no partner being liable beyond his share (see for instance F. C. C. §§ 1862 and 1863); but there are many other matters in respect of which non-mercantile partnerships, which in Germany include professional partnerships and partnerships between innkeepers, artizans, and small tradesmen generally, are, according to continental law, not governed by the rules applicable to mercantile partnerships (see G. M. C. §§ 85 and 10; F. C. C. act 20, art. 1, and the decisions thereon; and the I. C. d. C. art. 76, and art. 3-7).

In the United Kingdom one kind of mercantile partnership only is known, *i.e.* that in which all partners are liable for the partnership debts without limit. A person may—under the law originally laid down by the House of Lords in Cox *v.* Hickmann (8 H. L., C. 268), and subsequently declared by Bovill's Act, now re-enacted with certain slight alterations by P. A. 1890, § 2 (3)—have a share of profits without being a partner, but all partners are liable without limit. On the continent, on the other hand, there is a form of partnership called *société en Commandite* (see G. M. C. § 150; F. C. d. C. § 23; I. C. d. C. §§ 76, 117), in which one or several of the partners may limit their liability, whilst one at least of the other partners is liable without limit. The limited partners may divide their interest in the partnership capital into shares, in which case the partnership has some of the characteristics of a company, and is called *société en Commandite par actions* (see G. M. C. § 173; F. C. d. C. § 38; I. C. d. C. §§ 119 and 120) (see PARTNERSHIP, FORM OF, AS COMMANDITE). It was intended to introduce commandite partnerships with a share capital into the United Kingdom, and the provisions of C. A. 1867, § 4, are quite sufficient for the purpose; but it does not seem that any one has ever attempted to apply them. There is finally a form of partnership which exists in

[1] *The following abbreviations are used throughout this article:*—B. A. = Bankruptcy Act 1883; C. A. = Companies Act; F. C. C. = French *Code Civil;* F. C. d. C. = French *Code de Commerce*; G. M. C. = German *Mercantile Code;* I. C. d. C. = Italian *Codice di Commercio;* P. A. = Partnership Act 1890.

Germany, by virtue of a statute passed in 1892, in which all the partners are liable to a limited extent only (*Gesellschaft mit beschränkter Haftung*). This form of partnership is distinguishable from a limited "company" in various ways, but in the United Kingdom its place is taken up by "private companies," which are companies in the full sense, but have generally some provisions in their articles by which the more private character of the association is secured (*e.g.* clauses providing that shares cannot be sold without being offered to the shareholders).

According to English law a partnership established for banking having more than ten, and any other partnership having more than twenty members must, unless it belongs to certain privileged associations specially dealt with by statute, be incorporated as a company under the C. A. or by special act or by special charter (C. A. 1862, § 4). On the continent, on the other hand, there is no restriction as to the number of partners in private partnerships.

Persons who have entered into partnership are collectively called a FIRM (*q.v.*). In England the firm is only looked on as a collection of persons who have joint rights and joint liabilities, but in Scotland a firm is a legal person distinct from the partners of whom it is composed (P. A. 1890, § 4), and this is also the theory of French law. As it is now possible in England to bring and defend actions in the firm's name (R. S. C. 1891, Order xlviii. A. r. 1), the distinction has lost most of its importance.

One of the principal incidents of the partnership relation, which, in those continental countries in which mercantile partnerships are distinguished from others, attaches to mercantile partnerships only, is by the P. A. 1890, § 5, described as follows:—"Every partner is an agent of the firm and his other partners; and the acts of every partner who does any act for the carrying on in the usual way of business of the kind carried on by the firm of which he is a member, bind the firm and his partners, unless the partner so acting has in fact no authority to act for the firm in the particular matter, and the person with whom he is dealing either knows that he has no authority or does not know or believe him to be a partner." Where, however, one partner pledges the credit of the firm for a purpose apparently not connected with the firm's ordinary course of business, the firm is not bound, unless he is in fact specially authorised by the other partners (*ib.* § 7). On the continent, restrictions in a partner's implied authority are binding on third parties, although unknown to them, if entered on the register (see G. M. C. §§ 115, 86, 87; I. C. d. C. §§ 88, 90).

The question as to who is or who is not a partner in a firm is also of easier solution on the continent than in the United Kingdom, as a person registered as partner in a firm on the mercantile register is, as between himself and third parties, estopped from denying that he is a partner (G. M. C. § 25; I. C. d. C. §§ 103, 88; French St. 24th July 1867, §§ 55, 57, 61). In the countries governed by British law, registers of firms are not used, and it is therefore necessary to inquire into the exact facts in order to find out whether any given person may be treated as a partner or not, but persons "holding themselves out" as partners may be made liable as such, although they are not partners in fact (P. A. 1890, § 14).

The internal affairs of a partnership are generally arranged by contract between the partners. In the United Kingdom, a written contract is not required unless the duration of the partnership is to extend over a year, and in Germany a written contract is unnecessary in any event (G. M. C. § 85), but in France and Italy a written contract must be registered in all cases, and certain parts of it, including statements as to the names of the partners, the trade name, the authority of the partners to act for the firm, the duration of the partnership, and the amount of the partnership capital, must be published in certain newspapers (F. C. d. C. §§ 39, 41; St. of the 24th July 1867, § 57; I. C. d. C. §§ 87, 88, 90, 93).

The codes relating to the law of partnership contain regulations as to the rights in respect of the partnership property, the sharing of profits, the interests payable on advances of capital, the duty of partners not to carry on business in competition with the firm, the powers of majorities, the expulsion of partners, the duration of partnerships, and other matters (see P. A. 1890, §§ 19, 31; G. M. C. §§ 90-109; F. C. d. C. § 18; I. C. C. §§ 1707-1725; C. d. C. §§ 107-113) which have to be applied in the absence of contractual stipulations to the contrary.

The procedure to be adopted for the purpose of recovering partnership debts by execution against the property of individual partners, or the estates of deceased partners, is too complicated to be discussed in this place (as to the U. K. see P. A. § 9, and Kendall v. Hamilton, 4, Ap. c. 504; as to Germany, M. C. § 112; as to France, C. d. C. §§ 22, 64; C. C. §§ 1200, 1202; as to Italy, C. d. C. §§ 76, 206; C. C. §§ 1186, 1189). The rules in this matter are, in the view of English courts, mere matter of procedure, and must therefore be decided by the law of the place in which the action is brought, without reference to the law of the place in which the partnership business is carried on (*in re* Doetsch [1896] 2. ch. 830).

In case of bankruptcy the partnership creditors are, in the United Kingdom and Germany, entitled to the partnership property, and the

separate creditors of any partner are entitled to such partner's separate property. If any surplus remains in either case, such surplus is available for the partnership creditors, or the separate creditors, as the case may be (B. A. 1883, § 40 (3); G. M. C. § 122).

From an economic point of view the regulation of partnership law by rules adapted to the usages and requirements of mercantile life, is of great importance, as in consequence of such regulation the formation of partnerships and more especially their dealings with other traders and with each other, are considerably facilitated. The disadvantages of trading without partners are so obvious that they hardly require mention, but the comparison between partnerships and companies is more difficult. For those classes of business in which the personal capacities of the managers are of great importance, private partnerships may appear preferable, as they are more likely to retain permanent customers, but even in this respect much may be said on the other side, as the vicissitudes of health and the uncertainty of life make it impossible to rely with confidence on the continuance of the personal qualities which, in a given case, make it desirable to transact business with a particular firm, whilst on the other hand a company is more likely to be able to replace a capable manager by one equally capable, who, by having previously assisted his predecessor, will continue to work in the same manner.

In a private partnership there is, of course, a greater possibility for sons to continue in the footsteps of their father than in a company, and the continuance of firms by successive generations of the same family has many obvious advantages from a public point of view; but these advantages were much greater when the mercantile classes were socially distinct from the leisured classes. In our days a share in the family business is frequently looked on as property not involving any duties, enabling the owner to share the life of those who in former days would not have associated with persons deriving their income from "trade," and in such a case the advantages of the business traditions of the family must soon disappear.

The greater privacy of private partnerships may be more advantageous for the preservation of trade secrets, but with proper precautions the same result may be secured by a company.

The risks and disadvantages of trade being carried on by companies as distinguished from private partnerships have been frequently discussed. In a company there is nobody whose personal honour is affected by failure, and the persons who have a directing voice in the management do not necessarily suffer from the consequences of their carelessness or recklessness, and may be even benefited by the disasters of their company. The risk attendant on this circumstance may be lessened by legislation (see JOINT STOCK COMPANIES), and also by the education of public opinion which hitherto has been much too lenient in respect of the deficiencies of company directors, except in a few conspicuous cases, in which there were sensational features of a special kind.

But whether it be for good or for evil, it must be clear to any intelligent observer that private partnerships and unlimited liability are rapidly disappearing, and under these circumstances it is hardly worth while to propose any legislative reforms of partnership law; but an act providing for the compulsory registration of firms, and thus enabling creditors to ascertain who at a given moment are the partners in the firm with whom they are dealing, would be of great advantage, and could be introduced without much difficulty. The introduction of "commandite" partnerships at one time much discussed by reformers of partnership law, would probably be without any practical effect; if there was any real want for this form of partnership it could be easily supplied by taking advantage of the above-mentioned provisions of C. A. 1867, § 4. In the event of company law being made more stringent, it will probably be desirable to find a special form of association to facilitate trading with limited liability without the necessity of the restrictions which would then be imposed upon the formation and management of public companies (see as to this, paragraphs 65 and 66 of the *Report of the Departmental Committee of the Board of Trade on the Companies Acts* published in 1895), and for this purpose the introduction of private partnerships with limited liability similar to those established under the above-mentioned German statute of 1892 would be convenient.

[As to continental law, see the art. "Sociétés Commerciales," *Continental Mercantile Codes*.—Also Troplong, *De la Société*.—Deloison, *Traité des soc. commerciales franç. et étrangères*, 2 vols. 1882.—Houpin, *Traité général théorique et pratique des Sociétés Civiles et Commerciales*, 2 vols. 1895.—Hergenhahn, *Das Reichsgesetz betreffend die Ges. mit beschr. Haftung*, 1895.—See also the articles under the heading: "Die Handelsgesellschaften" i. to iii. in Endemann's *Handbuch*, vol. i. pp. 310-357. As to English and Scotch law, see Lindley, *Treatise on the Law of Partnership*, 6th ed. 1893.—Pollock, *Digest of the Law of Partnership*, 6th ed. 1895.] E. S.

PARTNERSHIP, MEDIÆVAL. The modern practice of partnership has a threefold root in mediæval usage. (1) The oldest form of partnership in the middle ages took its origin from Italy, and was known as *commenda*. This implied the handing-over, for a particular voyage or enterprise, of goods or money by one person who remained at home (*commendator, socius stans*) to another who undertook the management of the business (*commendatarius*,

tractator). The *commendatarius* was commonly rewarded with one-fourth of the gain. In the later centuries, the *commendatarius* usually contributed capital himself, and acted on behalf of a number of *socii stantes* or sleeping partners. It was in this way that most commercial undertakings were conducted which involved considerable capital; and the practice survived in the *société en commandite*, so general to-day on the continent of Europe (see COMMANDITE, SOCIÉTÉ EN).

(2) The joint household of brothers, relatives, or friends, "eating one bread" (*companis*), and engaged in the same industry, was apparently the direct parent of the ordinary private partnership of modern England and the *offene Gesellschaft* of modern Germany, and seems to have given them the characteristic of unlimited liability which distinguishes it from the *société en commandite*.

(3) The mechanism of the modern joint-stock company, however, may be traced back in large part to the GILD. The earliest joint-stock companies, like the English EAST INDIA COMPANY, had in every respect, *except* the joint-stock, the same organisation as the earlier companies of "adventurers" in foreign trade. These latter were modelled on the great town "crafts" or "companies," like those of the mercers or grocers; and these, in their turn, had but followed the example of the earlier merchant and craft gilds. In all these, though there was a small fund for certain common religious and social purposes, and various restraints were imposed on the economic action of members, each member traded on his own account and with his own stock. Even the East India Company began with a joint stock only for each voyage, and did not for some years create a permanent joint stock. The introduction of a joint stock was immediately due to the lessons of experience, but the forms adopted for the purpose were probably influenced by contemporary practice in the matter of government loans (see also PARTNERSHIP, LAW OF; and PARTNERSHIP, HISTORY OF).

[The most complete information on the subject will be found gathered together in the *Universalgeschichte*, forming vol. i. of L. Goldschmidt's *Handbuch des Handelsrechts* (new ed. 1891), where are also given abundant references to the literature. Among recent special monographs should be mentioned W. Silberschmidt, *Die Commenda in ihrer frühesten Entwickelung* (1884), M. Weber, *Zur Geschichte der Handelsgesellschaften im Mittelalter* (1889), and F. G. A. Schmidt, *Handelsgesellschaften in den deutschen Stadtrechtquellen* (1883). On these works is founded the account in Ashley, *Economic History*, vol. i. pt. ii. § 67. See also Parsons, *Principles of Partnership* (Boston, 1889), §§ 2, 3, 26; Troplong, *Du Contrat de société* (1843); Frignet, *Histoire de l'association commerciale jusqu'aux temps présents* (1868).] W. J. A.

PARUTA, PAOLO (1640-1698), a Venetian nobleman; a clear-headed political writer and historian of the Venetian republic. His work, *Della perfettione della vita politica*, discusses wealth, and, in opposition to socialistic views, defends private property.

Whilst other authors of his day considered wealth solely from a moral point of view, Paruta recognised also an economic side to it. He does not confuse the desire for wealth with the unrestrained longing to accumulate, nor is he biassed by preconceived ideas of ascetic morality which other writers of his day had inherited from the canonists (see CANON LAW). He considers man's desire to live and to improve his social position to be a right desire based on natural instinct. Therefore, that which other writers of his time condemned, Paruta considered only human and moral.

In the work we quote, Paruta defends private property, combats communism, and shows the impossibility of absolute equality, confuting the numerous writings, the outcome of the sad conditions of the times, which advocated reform based on communism. The law-giver, says Paruta, cannot equalise the wealth of citizens, because this would destroy liberality. It would not be reasonable that the most worthless citizen should be on the same level for wealth as the worthiest. This happens even now, he observes, but being due to chance and not to the law, is more easily tolerated. It would, in any case, be impossible to preserve equality if it were established, and it would necessarily bring about the community of goods and children, upheld by Plato, and lead to most serious troubles.

The real remedy, according to Paruta, is to distribute honours and taxation so that all may share in them according to their status, while educating all citizens to make a good use of their wealth, and abolishing gambling, usury, and all useless occupations. Further, while Paruta defends property, he objects to excessive concentration of possessions.

Della perfettione della vita politica di M. Paolo Paruta, nobile Vinetiano, Venetia, 1599.

PASCOLI, LEONE (18th century). Born in Perugia, an abbé and a considerable writer on economic subjects, too soon forgotten. In his book, written 1728, published anonymously 1733 at Perugia, untruly dated from Colonia, Pascoli anticipated the economic financial reforms attempted later by Pius VI. in the papal states.

Pascoli follows BOISGUILBERT, deriving from him the title of his principal work, and proposing protection for agriculture, but he does not absolutely repudiate mercantilism, his leanings towards which are shown in his

monetary policy which was designed to cause more coin to be brought into the country than left it. To secure this, trade was to be fettered, that the nation might preserve its economic independence and not waste its money on luxuries.

Pascoli's work has special regard to the condition of the pontifical states which he sought to improve. He proposes plans to raise agriculture and industry again to a flourishing condition, and he discusses the supply of food, trade, coinage, and finance. Free trade internally, free export of agricultural produce to foreign countries, simplification of the system of taxation, constituted the basis of the economic organisation suggested by him. To restore prosperity to agriculture, he proposed to re-establish the ancient privileges granted to cultivators, to release them from all taxes, and to prohibit the import of foreign cattle. He studied the best methods of rendering the Roman Campagna healthy, and maintained that the state should compel landowners to execute sanitary works. He advocated proportional taxation and special taxes to provide relief for the poor, similar to the English system, prohibition of the export of raw materials, and taxation of imported manufactures.

The title of Pascoli's book is, *Testamento politico di un accademico fiorentino, in cui con nuovi e ben fondati principii si fanno varii e diversi progetti per istabilire un ben regolato commercio nello stato della chiesa*, etc., Colonia, 1733.

[See, concerning Pascoli, Cossa, *Introduzione allo studio dell' economia politica*, Milan, 1892.—Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, 2nd ed., Palermo, 1896.—Gobbi, *La concorrenza estera e gli antichi economisti italiani*, Milan, 1884.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, Modena, 1893.]

U. R.

PASHLEY, ROBERT (1805-1859), barrister-at-law, afterwards Queen's Counsel. In 1833-34 he visited Greece and Asia Minor, and on his return published his *Travels in Crete* (2 vols. 8vo, Cambridge, 1837), a work which was much valued for the statistical knowledge it contained.

Pashley is best known to economists as the author of *Pauperism and Poor Laws* (London, Longman and Co., 1852, 1 vol., 8vo), a work in nineteen chapters, which treats of the subject under the following heads:—The number and cost of paupers in England, and in the metropolis; the pauperism of the agricultural and manufacturing districts; ecclesiastical provision for the poor till the Reformation; pauper legislation before and during the reign of Elizabeth; the relief of the poor from the reign of Elizabeth till the restoration of Charles II.; the statute of Charles II. for the removal of the poor; pauperism from the reign of Charles II. till the end of the 17th century; pauperism and the poor laws of England during the 18th century; the same from 1800-1834; the pauper legislation of the year 1834; the pauperism and poor laws of England since the passing of the Poor Law Amendment Act in 1834; the effect of the law of settlement on the dwellings of labourers in agriculture; on the necessity of a total repeal of the law of settlement and removal of the poor; the remedy by abolishing removals and substituting relief in money; proposed remedy by union settlement and union rating; other proposed remedies; the author's proposal, which was "that the law of settlement be wholly repealed, that the various provisions for raising and administering relief to the poor be consolidated into one statute; that the yearly sums needed for such relief continue to be raised by parochial rates on real property; that two-thirds of this sum be raised by a pound rate equal throughout the whole country; and the remainder by a further pound rate, raising in every parish a sum equal to one-third of the actual expenditure of such parish (ch. xix. *Pauperism and Poor Laws*).

Pashley also published *Observations on the Government Bill for abolishing the Removal of the Poor* (2nd ed. revised, London, 1854, 8vo).

A. L.

PASLEY, LIEUT.-GENERAL Sir C. W., R.E. (1780-1861), wrote:—*Observations on the Expediency and Practicability of Simplifying and Improving the Measures and Weights and Money used in this Country without materially altering the Present Standard* (8vo, London, 1834).

As the result of his investigations Pasley was made a member of the commission of scientific men, appointed in 1838 to report on the steps to be taken for the restoration of the standards of weight and measure consequent on the destruction of the standard yard by fire at the House of Commons. Pasley assisted in drawing up the report issued in 1841, and in his capacity of commissioner proposed the adoption of the DECIMAL SYSTEM of coinage, preparatory to the introduction of a similar scale of weights and measures.

In his *Plan for simplifying . . . the weights, measures, and money of this country*, a paper read before the British Association at Cheltenham, 12th Aug. 1856, and published 1857, Pasley gave in detail tables of the proposed new measures of length, surface, solidity, capacity, and weight—and (ch. v.) of the new monetary system. He stated the difficulties urged as objections to the proposed decimal coinage; and showed their groundlessness (ch. vi.). In ch. vii. he detailed the advantages of the new system; and, in the last chapter, discussed the objections to the French metrical system: "that it has proved an entire failure as regards astronomy and navigation, and that, instead of proposing uniformity, it has caused greater confusion in the weights and measures of France than ever prevailed before" (ch. viii.).

He also wrote much on military subjects.

A. L.

PASSE-DEBOUT (Fr.). The permit delivered to the carrier of provisions or merchandise passing through a town in which octroi duties

are levied, in transit for a locality outside the limits of the place, or on their way to a market inside the town, and to be taken back if unsold. The amount of the dues is deposited at the gatehouse on entering, and is reimbursed on presentation of the *passe-debout* on leaving. If the amount of the octroi tax is large the escort of an officer from one extremity of the town to the other may be obtained on payment of a fee in lieu of the deposit of the duty. Goods remaining more than twenty-four hours must be lodged in a registered warehouse.

T. L.

PASSENGER DUTY. See TAXATION.

PASSY, HIPPOLYTE PHILIBERT (1793-1880) born at Garches-Villeneuve near Saint Cloud, died in Paris. He was born on the very day of the execution of Marie-Antoinette (16th October), his father being in prison as a "suspect," and his mother in hiding. He began life as a soldier—left his military school in 1811, and took part in the Russian campaign as a cavalry officer. He was wounded on several occasions, and on one even left for dead; but he took part in 1814 in the defence of Paris at Montmartre. Leaving the profession of arms, he sailed for the United States. During the voyage the *Wealth of Nations* fell, by chance, into his hands. To pass the time he read the volume, and thus became an economist. His fine intellect served him well in the many high offices he afterwards held. Meanwhile, after his return from America he occupied himself for some ten years in cultivating an estate which he had inherited near Gisons (Eure), and his mind became matured by experience while he enriched it by study. As editor of the *National* of Armand Carrel he was appreciated as he deserved by the able men of various descriptions whom the revolution of 1830 brought to the surface. The district of Louviers returned him to the chamber of deputies. He was minister of finance from the 10th to 18th November 1834 (ministry of Bassano), then minister of commerce from 22nd February to 7th September 1836 (ministry of Molé), minister of finance again from 12th May 1839 to 29th February 1840 (ministry of THIERS). In 1844 he was raised to the chamber of peers. After the revolution of February 1849 had overthrown the monarchy, he became a member of the constituent assembly and afterwards of the legislative assembly; finally, the president of the republic, Louis Napoleon, made him minister of finance on 20th December 1848. He retained this post till 30th October 1849, the date when the prince-president began distinctly to modify his policy. It was during this last occasion of his holding office that he unsuccessfully proposed to levy a tax on the rent of house property as a practical solution of the income-tax. The *coup d'état* definitely put an end to his political career, and from that time he gave himself up absolutely to economic science. He entered the institute (*Académie des Sciences morales et politiques*) in 1833 as correspondent, and in 1838 as member. He prepared in that capacity many reports, among which may be noticed a paper in 1878, *De l'histoire dans ses rapports avec les sciences sociales et politiques.* A member of the economic society from 1844, he became its second president in 1845, and, on the death of Ch. Dunoyer in 1862, the first president. He was one of the founders of the statistical society of Paris in 1860, was vice-president in the second year, president in 1868, and honorary president after 1873. In all these learned societies his opinion had great weight; this was due both to his force of character and to his twofold gifts as a thinker and a practical man.

Passy wrote, besides his political works: *De l'aristocratie considérée dans ses rapports avec les progrès de la civilisation*, 8vo, 1826.—*Des systèmes de culture et de leur influence sur l'économie sociale*, 8vo, 1st ed. 1846, 2nd ed. 1853.—*Des causes de l'inégalité des richesses*, 18mo, 1849.—*Des formes de gouvernement et des lois qui les régissent*, 8vo, 1st ed. 1870, 2nd ed. (The author supports a constitutional and parliamentary monarchy.)

A. C. f.

PATENT AND PATENT LAW.

Patent, p. 74; Historical Observations on Patent Law, p. 75; Specification of Invention, p. 75; Requirements as to Validity of Patent, p. 75; Ditto as to Person of Patentee, p. 75; Investigation by Patent Authorities prior to Grant of Patent, p. 76; Duration of Patents, p. 76; Regulations as to Fees, p. 76; Provisions for insuring working of Invention, p. 76; Provisions for insuring benefit of inventions useful for public purposes to Government Authorities, p. 77; Patent Journals and Patent Libraries, p. 77; International Arrangements, p. 77.

Patent is the name for a grant by the government of a country of a privilege enabling the patentee or his licensees to "make use and exercise and vend" the invention, and to restrain any unauthorised person from using or imitating it. A patent is always granted for a limited time and a limited area.

Some economists of authority, among whom PRINCE SMITH (*q.v.*) holds a prominent place, maintain the proposition that the grant of patents is detrimental to the public welfare, but there is now a general consensus of opinion in the opposite direction, it being recognised that it is not only just that inventors should, within certain limits, enjoy a personal benefit from their inventive skill and labour and outlay, but that it is also beneficial to the community that inventions should be encouraged and made.

Modern patent law has contrived numerous safeguards for the protection of the public, among which the limits of time, and the requirements as to publicity, are the most important. The effect of the law is to make the invention public property after the expiration of the patent, and an inventor who has reason to

believe that the secret of his invention can be kept, is in a better position if he does not apply for a patent.

It is worthy of notice that in most countries having a patent law there are certain provisions which are intended to insure that patented articles should be manufactured within the country in which the patent is granted. The granting of patents in this way acts as a protection to native industry.

Historical Observations.—It is generally said that patent law was first created by a passage in the statute of James I. abolishing MONOPOLIES (*q.v.*), which, by way of exception, reserved a right to the crown to issue "letters patent . . . for the term of fourteen years or under . . . of the sole working or making of any manner of new manufacture within this realm to the true and first inventor and inventors of such manufactures," and one of the best-known writers on the subject (Kohler in his *Deutsches Patentrecht*, on p. 26) is of opinion that the industrial pre-eminence of England is essentially due to this circumstance. It seems hardly safe to accept the dictum of a legal writer, however eminent, for a proposition of such startling character, and it must also be observed that the statute of monopolies did not create, but only restricted and regulated, the right of the crown to grant patents.

The exception in the statute of monopolies did not, moreover, entitle an inventor to the grant of a patent as of right, but left him dependent on the favour of the crown.

Its principal importance is due to the fact that, for the first time, it recognised a clear distinction between patents for inventions and other monopolies, whilst on the other hand the public interest, which would seriously suffer if patents were granted for an unlimited period, was safeguarded by the introduction of a time limit.

In modern law the right of every inventor, who complies with certain conditions, to enjoy a monopoly for a limited period is almost universally acknowledged, though in some countries (as, for instance, in Denmark, where the first Patent Act was passed in 1894 only) the recognition of this principle is of very recent date. The patent law of the United Kingdom is regulated by the act of 1883. Patent acts were also introduced in the following British colonies and possessions at various dates:—Barbados, British Guiana, British Honduras, Canada, Cape of Good Hope, Ceylon, Hongkong, India, Jamaica, Leeward Islands, Mauritius, Natal, Newfoundland, New South Wales, New Zealand, Queensland, South Australia, Straits Settlements, Tasmania, Trinidad, Victoria, Western Australia.

Specification of Invention.—The grant of a patent is always subject to the condition that the invention should be fully described by the applicant. This is made specially clear by the United States Statute, Rev. Stat., 1874, § 4888; and by the German Statute of 1891, § 20, which requires a description so explicit that experts may by its perusal be enabled to use the invention. The law of the United Kingdom allows a provisional specification to be filed in the first instance, which must, however, within nine months, be followed by a complete specification (Patent, etc., Act, 1883, §§ 5 (3); 8).

Requirements as to Validity of a Patent.—The limits within which inventions are patentable vary in different countries. Novelty, originality, and fitness for industrial purposes are required everywhere, and it is also the universal practice to exclude articles intended for unlawful and immoral purposes (see, for instance, Statute of Monopolies, § 6; French Statute of 1844, §§ 1 and 2; German Statute, § 1; Austrian Statute of 1897 (which will come into force in 1900), § 1, but in some systems of law other articles are excluded as well as those just mentioned. Thus the French Statute (§ 3) excludes all medicines, and the German Statute (§ 1 [2]) excludes articles of food, articles intended for medical purposes, and all substances produced by chemical process.

Most patent laws protect *inventions* only as distinguished from *discoveries* (as to the meaning of the distinction, see Lord Justice Lindley's judgment in Lane-Fox *v.* Kensington and Knightsbridge Electric Company [92], 3 Ch. 424, 428, 429), but the French law protects discoveries as well as inventions (toute nouvelle découverte ou invention), excluding, however, plans and combinations relating to credit and finance (French Statute, §§ 1 and 3).

Requirements as to Person of Patentee.—In most countries patents are granted to the "true inventor" only, and in some (*e.g.* in the United States Revised Statutes, 1874, § 4892) the applicant must declare on oath that he is the true inventor; whilst in others, such as Austria (see Austrian Statute, §§ 29 and 4), the first applicant is presumed to be the true inventor until the contrary is proved. The expression "true inventor" is not, however, always construed literally. Thus, in the United Kingdom it includes (1) a person who, having, in a place outside the United Kingdom, become acquainted with an invention, not being part of the common knowledge in the United Kingdom, brings it over to the United Kingdom, and then takes out a patent; (2) an inventor forestalled by a prior inventor, who did not publish his invention so as to make it part of the common knowledge (see the judgment of Jessel, M.R., in Plimpton *v.* Malcolmson, 3 Ch. D. 351, 556).

The German statute (§ 31), with the view of discouraging delay in the fructification of useful inventions, puts the *first applicant* into the place of the true inventor, subject, however, to the right of an injured person, within a specified period (see § 23), to object to the grant on the ground that the essential part of the specification was taken from the descriptions, drawing, models, or appliances of a person other than the applicant, without the consent of such person. If the objector is successful, he may be put into the same position as if he had applied for the patent in the first instance.

In most countries patents are granted without regard to the nationality of the patentee (see, for instance, Patent, etc., Act 1883, § 4 (1); French Statute, § 27), but in Germany (§ 12) and Austria (§ 7) a patent is not granted to a foreign applicant unless he appoints an agent, residing in the country in which the application is made, with full powers to represent the applicant in all

proceedings relating to the patent. In some systems of law it is also provided that the subjects of foreign states must submit to the same disabilities in respect of the grant of patents as those imposed on foreign subjects in their own country (see, for instance, German Statute, § 12; Austrian Statute, § 31).

Investigation by Patent Authorities prior to Grant of Patent.—This is one of the points in respect of which considerable diversity prevails. In France a patent is granted without any examination as to the patentable character of the invention in respect of which it is claimed, or of the correctness of the specification ("Les brevets dont la demande aura été régulièrement formée seront delivrés sans examen préalable *aux risques et périls des demandeurs et sans garantie, soit de la réalité de la nouveauté ou du mérite de l'invention, soit de la fidélité ou de l'exactitude de la description*," § 11).

In certain other countries, among which the United States, Germany, Austria, and Hungary (statute of 1895) are the most prominent, a most elaborate investigation takes place not only in respect of the correctness of the description and all formal requirements, but also as regards the merit and originality of the invention, and generally as to its patentable character (United States Revised Statutes, § 4893; German Statute, § 21; Austrian Statute, § 55).

A second method of testing the validity of a patent adopted by the German and Austrian laws, is the publication of the details of the application for the purpose of enabling objectors to oppose the grant, which they may do within two months from the date of the publication (German Statute, §§ 23 and 24; Austrian Statute, § 58).

British Patent Law takes a middle course between the absolute non-interference of the French system and the full inquiry of the American and German system. The official examination is confined to questions as to the correctness of the description and the completeness of the specification (Patent, etc., Act 1883, §§ 7 and 9), but as in Austrian and German law the details of the invention are published (*ib.* § 10), and objectors have a right to be heard within two months from the date of the advertisement. Such objections are, however, restricted in their scope, and may not extend to every ground affecting the validity of the patent (*ib.* § 11).

It is possible everywhere to have a patent revoked or declared void on the ground that the invention was not patentable, but in Germany this right is barred after the lapse of five years from the date on which the grant of a patent was publicly announced (Patent, etc., Act 1883, § 26; United States Revised Statutes, § 4918; German Statute, §§ 28 and 29; Austrian Statute, §§ 28 and 29; French Statute, § 30); it should, however, be borne in mind that, in countries in which a strict examination takes place before a patent is granted, the risk of invalidity is, of course, much smaller. The vendor of a patent does not as a general rule guarantee its validity unless he expressly covenants to do so.

Duration of Patents.—The maximum duration of patents is fifteen years in France, Germany, and Austria, seventeen years in the United States, and fourteen years (but subject to extension as mentioned below) in the United Kingdom (French Statute, § 4; German Statute, § 7; Austrian Statute, § 14; United States Revised Statutes, § 4884; Patent, etc., Act 1883, § 17), but in France and in the United States the duration of patents for inventions previously patented in any other country cannot exceed the term of the patent granted in such other country (French Statute, § 29; United States Revised Statutes, § 4887).

In Spain, original and new inventions not previously patented in any other country are entitled to patents for the term of twenty years; if an invention has been patented in other countries at a date not more than two years prior to the date of the Spanish application, the maximum duration of the patent is ten years; and if an invention is not new or not original, the term of the patent may not exceed five years (Spanish Statute of 1875, § 121).

The United Kingdom is the only country in which an extension of the term of a patent may be obtained on petition. The petition must be addressed to the judicial committee of the privy council, who, if they are of opinion that the patentee, having regard to the merits of the invention in relation to the public, has been inadequately remunerated by his patent, may recommend an extension of the term for a further period not exceeding seven, or in exceptional cases fourteen, years (Patent, etc., Act, § 25, and see "*In re* Samey and Solvay's Patent [1895]; Appeal Cases 78). A similar rule formerly existed in the United States, but is now no longer in force (United States Revised Statutes, § 4924).

Regulations as to Fees.—The continuation of the validity of a patent is generally made dependent on the payment of certain fees. In most countries these fees are payable by instalments or annually. In some countries the early instalments are lower than the subsequent ones, for the purpose of enabling the patentee, in the case of a non-successful invention, to abandon the patent without having paid a large sum in fees, and on the other hand enabling the crown to profit by the success of a successful invention (Patent, etc., Act 1883, second schedule). The principle of progressive fees is carried out most consistently by the German Statute (§ 8). Power is given in most countries to remit the fees in appropriate cases (Patent, etc., Act 1883, § 24 (2) German Statute, § 8).

Provisions for ensuring Working of Invention.—The granting of a patent may be a hindrance to industrial life, if the patentee, through want of energy or want of means, neglects to work his invention, whilst others, who would be willing and able to do so, are afraid of infringing his rights. A patentee may also take out a patent for the sole object of restraining competition with articles not manufactured in the country in which the patent is taken out, and thereby injure the trade of that country. Modern patent law tries to prevent such abuses in various ways. Thus in the United Kingdom the board of trade may compel the patentee to grant licenses on reasonable terms to any person showing that the patent is not worked in the United Kingdom, or cannot be used to the

best advantage, or that the requirements of the public cannot be supplied (Patent, etc., Act 1883, § 22); and in Germany and Austria the patent may, under similar circumstances, be cancelled altogether (German Statute, § 11; Austrian Statute, § 27). In Austria a compulsory license may also — subject to certain specified conditions — be obtained by an inventor who has so materially improved a previously patenteed invention, that, in consequence of such improvements, its industrial importance is materially increased. In such a case, however, the original patentee may in his turn obtain a compulsory license in respect of the improvement (Austrian Statute, § 21).

Provisions for ensuring benefit of Inventions useful for public purposes to government authorities. —The British statute (§ 27 [2]) provides that the authorities administering any public department may, on terms agreed upon between the parties, or in case of necessity to be fixed by the treasury, use any patented invention for the services of the crown, and similar rules exist in Germany and Austria (German Statute, § 1; Austrian Statute, § 21).

The German statute also provides (§ 23) that in the case of applications for patents on the part of the imperial authorities in connection with the purposes of the army or navy, a patent may be granted without the public announcement required in ordinary cases. In such a case the patent is not entered in the register (German Statute, § 23).

Patent Journals and Patent Libraries.—All patent offices publish periodical information on inventions, which, besides serving their immediate purpose, are also generally useful. The collections and libraries which in many places (*e.g.* in London) exist in connection with the patent office are open to the public.

International Arrangements.—An international congress for the purpose of securing the general protection of "industrial property" including patents was held at Vienna in 1873 and at Paris in 1878, and resulted in the formation in 1883 of a "Convention pour la protection de la propriété industrielle," to which the United Kingdom acceded on the 17th of March 1887 (by virtue of the powers conferred by Patent, etc., Act 1883, § 103). The United States and a number of other states, including France and Belgium, are members of the convention; but Germany and Austria have not joined, these countries having entered into a separate arrangement in 1891, and another arrangement having been made between Germany and Italy in 1892. The principal provisions of the convention of 1883 are: (1) that an applicant for a patent in any contracting state shall, if applying within six (or in certain specified cases within seven) months in any other contracting state, be treated as if his application in such other state has been contemporaneous with his application in the first-named contracting state; (2) that temporary protection shall be given to articles patenteed in any contracting state and exhibited at any officially recognised public exhibition in any other contracting state; (3) that an international office shall be established at Berne, and that a journal called *Propriété industrielle* shall be published at such office. The publication of the last-mentioned journal seems to be the most important result of the convention.

The British government has authority to enter into mutual arrangements relating to patents with any British colony (Patentee Act 1883, § 104).

The most complete collection of patent laws is the one published by Gareis, and continued by Werner, of which 7 vols. have hitherto appeared. Carpmael, *The Patent Laws of the World*, 2nd ed., 1889, is somewhat out of date now. Edmunds and Renton, *The Law and Practice of Letters Patent for Inventions*, 1890, gives a summary of foreign patent laws, but is also somewhat out of date in that respect. The latest statutes, besides the above-mentioned Austrian statute of 1897, are a Russian statute (published in St. Petersburg in German), a Danish statute of 1894 (published in German in Berlin), and a Hungarian statute of 1895. E. S.

PATENTE (Fr.) A trade tax or license imposed on all persons in France exercising a trade, profession, or industry, unless specially exempted. The *patente* is distinct from the *license*, which is limited to a small number of trades, generally those under the supervision of the department of indirect taxes, corresponding to the English excise. Trades subject to the *license* usually pay the *patente* also. The *patente* was first established in 1791, when the trade corporations were abolished, and was a substitute for the dues paid by those bodies. It was at first a simple tax on the rental of the place of business and residence, and applied only to certain trades, but in 1798 it was extended and converted into a double tax—one fixed, the other proportional. A law of 1844 which forms the basis of the present legislation included all trades, professions, and industries with the exception of public functionaries, professors, writers, artists, the wage-earning classes, and certain petty occupations carried on without hired assistance. The fixed duty (*droit fixe*) is assessed on the nature of the trade or industry, and the population of the locality, increasing with the number of the inhabitants. The proportional duty (*droit proportionnel*) is based on the rental, and in addition, in some cases, on the number of hands employed. Certain trades, the importance of which cannot be estimated by the population or the rental, are taxed on their means of production, such as the number of spindles, looms, ovens, machines, etc., or, as for shipowners, the tonnage of their vessels. The taxes are combined so as to equalise the incidence as far as possible between the different trades, as some of the most lucrative are carried on in small offices or workshops, while others, in which the profits are small, require extensive premises. For the application of the fixed duty all trades and professions are divided into eight classes. In the highest, the rate in Paris and towns with a population of over 100,000, is 400 francs (£16), descending gradually to 35

francs (£1 : 8 : 4) in localities with less than 2000 inhabitants. In the lowest class the limits are 12 francs (9s. 10d.) and 2 francs (1s. 8d.). The liberal professions subject to the tax, such as those of architect, solicitor, barrister, doctor, etc., pay only a proportional tax of one-fifteenth of the rental. Persons carrying on several branches of trade in the same building formerly paid only on that on which the tax was the highest; but a law passed in April 1893 with the view of protecting small shopkeepers from the competition of the great stores, created special taxes for those employing more than 200 hands including clerks, assistants, buyers, porters, etc., which are made to pay on each branch or speciality not exceeding sixteen in number; the tax on the number of hands employed was also made progressive, commencing at 25 francs per head for the first hundred, and increasing 10 francs (8s. 11d.) per head for each hundred beyond that number, so that with 2000 hands the last hundred pay 215 francs (£8 : 8 : 4) per head, and with 3000 315 francs (£12 : 8 : 4). This aggravation of the tax was intended to reach two or three well-known business centres in Paris.

Persons having several separate establishments of the same or different kinds pay the *patente* for each. The proportional tax on the rental is generally from 5 to 10 per cent, but in some cases it rises to 15 per cent, or descends to 2 per cent. If the proprietor does not reside on the premises his separate habitation is taxed also. The classification of trades and professions is revised every five years, to include the new ones which may have sprung up in the interval. The list is, however, very comprehensive, and contains about 1500 different occupations. The new are assimilated provisionally to the one they approach the nearest. The *patente* produces about £5,000,000 annually.

[Edouard Vignes, *Traité des Impôts en France.*—Maurice Block, *Dictionnaire de l'Administration.*—Duvergier, *Collection des Lois.*] T. L.

PATERSON, THOMAS (1828-82), wood carver, lecturer, and organiser of workmen's clubs, wrote—

A New Method of Mental Science with applications to Political Economy, published posthumously in 1886. His theory was that "in economical problems the physical and mental elements have to be differenced . . . if we apply to the physical and limited element reasonings only applicable to the mental elements or *vice versa* . . . we shall fail." Thus "labour" includes "force" and "plan": no limits can be set to the possible progress of plan. Possession is physical or mental: if the latter, it need not involve interference with other people's user, or the juristic idea of property. The modern employer was a labour-seller not a leader, and Paterson's ideal was "a co-operative society in which the fittest should lead, working as much for honour as for pay." J. D. R.

PATERSON, WILLIAM (1658-1719), merchant, was the founder of the BANK OF ENGLAND (*q.v.*) and author of the unfortunate Darien scheme (see DARIEN COMPANY). He was a vigorous opponent of inconvertible paper money, and appears to have suggested the SINKING FUND (*q.v.*) of 1717. His scheme for the redemption of the debt was pronounced by the *Economist* (October 23, 1858) "faultless." He was one of the earliest advocates of free trade, as opposed to the mercantile system. "There is not any one part of trade but might and would prosper better without than in a monopoly." "Trade is and will be capable of increasing trade, money of begetting money, and one improvement of making way for another, till the end of the world." His proposal for a council of trade is in several respects noteworthy. Among the powers to be given to this body were "to hear and determine all causes . . . relating to trade . . . by the law merchant and that of the sea": to purchase and build workhouses and granaries: to have power to add unto, or allow 10 per cent to, the joint stocks of all companies . . . for manufactures . . . and generally to give such other encouragements . . . as they shall think requisite for . . . promoting and enlarging trade and industry." Paterson further proposed that the punishment of death in cases of theft shall be changed to "the payment of fourfold," and that all "bribery, cheating . . . wilful bankruptcy or fraud" should be punished as theft. He strenuously opposed any tampering with the coinage. "Thus it happened: we tacitly determined, by our general practice, that a clipped coin was of equal value to an unclipped one . . . and so, being content to take halves for wholes, were put upon accordingly. If the disease be the inequality of our coin, the remedy must consist in its equality." He held enlightened views on the self-government of colonies, and proposed to found a public library for books on trade. He was ruined by the failure of the Darien company, but received, in 1715, a parliamentary grant of over £18,000. Paterson's memory and works were rescued from prejudice and obscurity by the indefatigable labours of Mr. S. Bannister.

The Writings of William Paterson with Biographical Notices, by S. Bannister, 3 vols., 2nd ed. London, 1859, 8vo, contain his authentic works. These include, *Central America in 1701* (publ. by Bannister 1857).—*Proposals of a Council of Trade*, 1701, 12mo.—*A proposal to plant a Colony in Darien*, 1701.—*Dialogues upon the Union at the Wednesday Club in Friday Street*, 1706 and 1717. The latter are also *Upon the redemption of the National Debt and Taxes.*—Bannister ascribes to Paterson *Letters to J. Locke on Remedy for Diseases incident to Coin*, 1696, but throws doubt on the *Conferences on the Public Debt by the Wednesday Club in Friday Street*, 1695, mentioned by M'Culloch in *Literature of Political Economy*. The account of the proceedings in

connection with the establishment of the Bank of England is in the 1717 pamphlet, pp. 63-73 of vol. ii. of *The Writings, etc.* See also *The English Historical Review*, vol. xi. p. 260, art. by W. A. Steel. H. E. E.

PATRIZI, FRANCESCO (1412-1494) born at Siena, became bishop of Gaeta, where he applied himself to study.

He was a contemporary of CARAFA, and may be included among the humanists (see HUMANISM); but he made no original contribution to political science. He repeated the theory of ARISTOTLE without enriching it. He recommends protection for merchants and tradesmen, the latter of whom, also according to him, contribute to the enriching of a country; no protection at all however, he argues, should be granted to the importers of articles of luxury. He considered that the state should provide the means of subsistence for the population, and proposed the institution of prefects to preserve the corn in the public granaries (see GRENIERS D'ABONDANCE). Living in the kingdom of Naples, he naturally occupied himself with the much-debated question of the Royal DOMAINE (*q.v.*), maintaining the advisability of its maintenance; considering, however, that, for the advantage of agriculture, such *bona fiscalia* should be administered through the system of perpetual tenants.

De regno et regis institutione, Parisiis, 1519, 1534, 1567, etc.—*De institutione reipublicae*, Parisiis, 1518, etc. A. B.

PATRONAGE is the name for the right to appoint the holder of a public office. Such a right may be vested in the crown, in which case it is exercised on the recommendation of the minister to whose department the vacant office is subordinated, or in the holder or holders of some other office or offices, or it may be attached to the ownership of land. The right to appoint to offices held by laymen, which at one time was looked upon as a source of pecuniary emolument, is now—as a rule—exercised in accordance with definite general rules, and subject to the vigilant control of public opinion, and the word "patronage" is now generally used with respect to clerical offices only, and more particularly in relation to the appointment of parochial incumbents. While many livings are under the patronage of the crown, or of public or quasi-public bodies, who are supposed to exercise their right with reference to the merits of the candidates, there are many others as to which the right to appoint the parochial incumbent is vested in a private patron, being either the lord of the manor, or in the case of the right of patronage having been severed from the manor—in which case it is called an "advowson"—the owner of the advowson, who may reserve the appointment for relatives or friends, or sell the next presentation during the life of the actual incumbent, and, on the living becoming vacant, appoint the purchaser's nominee, unless the vacancy arises through the selection of the last incumbent for a bishopric, in which case the patronage is, *pro hac vice*, vested in the crown.

The sale of the presentation during a vacancy is legally "simony," and therefore unlawful; and it is also "simony" for the proposed incumbent himself to purchase the next presentation; but the sale of the next presentation to a third party, who may be a near relative of the proposed incumbent, is not condemned either by law or public opinion. Ecclesiastical patronage may therefore be a source of pecuniary profit. E. S.

PATRONAGE (in the French sense). Besides its general sense, this word in French is specially applied to institutions organised and in many cases directed by the heads of manufactures and mills, or by beneficent associations, to promote the moral and material welfare either of their own workmen, or of the working classes in general, discharged prisoners, destitute young girls, etc. These institutions take various forms, such as *patronages* affording facilities for the investment of small savings, or providing at cost price sanitary dwellings or food and articles of large consumption (called, in this case *économats*); the purpose of others is, the opening of places for healthy and moral recreation, etc. LEPLAY (*q.v.*) and his school have been the most energetic and convinced promoters of these institutions: as a matter of fact, most of them have worked satisfactorily both for men and masters. The latter now tend to recede as much as possible into the background, and to give up the management to the men themselves. Yet the masters are charged, in socialistic circles, with steadily aiming at the exercise of tutelary or rather of oppressive power.

[The *Rapport de la Section d'Économie Sociale* of the Paris exhibition of 1889 (2nd vol. 1890) gives information on the then existing *patronages*. See also the article *Patronages* in the *Nouveau Dictionnaire d'Économie Politique*, the collection of the *Réforme Sociale*, Leplay's *Réforme Sociale en France* (vol. ii. pp. 406-435, ed. 1867), and Fougerousse, *Patrons et ouvriers à Paris* (1880).] E. Ca.

PATRONUS. (1) The head of a patrician family, to whom persons attached themselves as dependent members of the family (*clientes*, see CLIENT), was their *Patronus*. (2) A master who gave his slave liberty by a legal act of manumission became thereby *patronus* of such freedman (*libertus*), a family relation of duty and protection being thus constituted between them. (3) Patronus may also signify a defender of the cause of another in a court of justice. E. A. W.

PAULETTE. The practice of raising a revenue by the sale of offices was introduced into France in the 15th century and became a regular system in the 16th century. Few financial expedients have proved more ruinous.

In the first place the income derived was casual and not regular, and the occasional windfalls were practically loans on which the payments to office-holders constituted an excessive interest. Thus the sale of offices gave rise to a disguised national debt contracted on very disadvantageous terms to the state. And the financial loss was by no means the only evil. In order to make the offices valuable it was necessary to give the holders a secure tenure, and so the crown had to abandon the power of dismissal. Thus the office-holders became independent, and the judges in the parliament of Paris and other sovereign courts, who had in early times been the strongest supporters of the royal power, became in the 17th and 18th centuries the most resolute opponents of the monarchy. An inevitable result of the practice of purchase was that the buyers began to look upon their places as private property. This was partially recognised by an ordinance of 1567, which allowed an official to transfer his office to another, provided that (1) the original holder survived for forty days after the bargain, and (2) the recipient paid a third of the purchase money to the state. In 1605 Sully, the great minister of Henry IV., took the final step in this direction. The members of the sovereign courts were allowed to hold their seats as private and heritable property on condition of paying annually to the state a sixtieth part of their value. This charge was called the *droit annuel*, but is more usually known as the *paulette*, because the collection of the charge was in the first instance farmed out to a man called Paulet. This innovation of Sully's was a financial reform, because it substituted a regular yearly income for the casual in-comings which resulted from the practice of sale. But, from the point of view of the monarchy, the political results were by no means equally satisfactory. By the institution of the *paulette* the magistracy was made into a close hereditary class, and thus its independence was greater than ever. This result was to some extent foreseen, hence the system was not at first made permanent, but was fixed only for a period of years. Thus the crown reserved some control over officials, and could threaten, in case of opposition, to put an end to the *droit annuel*, which would at once deprive them of the property in their seats. But the official classes clung tenaciously to a system which gave them such obvious independence. When, in 1648, the government tried to coerce the judges, by allowing the *paulette* to expire without renewal, the vigorous opposition of the parliament of Paris was one of the chief causes of the Fronde. And their opposition was so far successful that, with some few interruptions, the *paulette*, and the hereditary tenure of offices of which it was the symbol, lasted till the old *régime* was overthrown by the Revolution (FARMER-GENERAL; FARMING OF TAXES).

[Clamagéran, *Histoire de l'Impôt en France*, t. ii. p. 378, *et seq.*] R. L.

PAULUS JULIUS, a Roman prætor of the 3rd century. In the *Corpus Juris*, under the title of the Purchase-Sale (Dig. XVIII, i. 1) is inserted a law of Paulus, which explains the origin of exchange and specifies the function of money.

The Prætor says: "Origo emendi vendendique a permutationibus cœpit: olim enim non ita erat numus: neque aliud *merx*, aliud *pretium* vocabatur: sed unusquisque secundum necessitatem temporum, ac rerum, utilibus inutilia permutabat, quando plerumque evenit, ut, quod alteri superest, alteri desit; sed quia non semper, nec facile concurrebat, ut cum tu haberes quod ego desiderarem, invicem haberem, quod tu accipere velles, electa materia est, cujus publica ac perpetua æstimatio difficultatibus permutationum, æqualitate quantitatis subveniret; æque materia forma publica percussa, usum dominiumque non tam ex substantia præbet, quam ex quantitate: nec ultra *merx* utrumque, sed alterum *pretium* vocatur."

The Italian economists of the last century discussed with much learning and heat the Roman ideas on money, its origin, and the functions of exchange —while PAGNINI maintained that the ideas of the Romans on money were altogether opposed to those of the economists of his century, Gian Rinaldo Carli and more fully Pompeo NERI showed that they were conformable to them. See also the monograph of Giulio Alessio on the conception of value in classical antiquity (*Archivio Giuridico italiano*, vol. xlii. Bologna, 1889); H. Cernuschi discussed it, showing that the conception of money as he explained it was entirely conformable to that of the Prætor Paulus Julius (*Anatomie de la Monnaie*, Paris, 1886, pp. 9-10).

See in the "*Corpus Juris Civilis romani*": Edit. cum notis integris Dionysii Gothofredi, Neapoli, 1828, Lib. xviii. Tit. I.—*De contrahenda emptione et de pactis inter emptorem et venditorem compositis et quae res venire non possunt. De origine emptionis, et venditionis, ejusque et permutationis differentia.—De nummis I. Quibus modis emptio contrahitur.*—I. Paulus, lib. 33, *ad Edictum.* A. B.

PAUPERIES is an expression used in Roman law for accidental injury caused to a person by an animal belonging to another, contrary to the nature of the animal. The party thus injured could claim from the owner of the animal damages for the injury, unless the owner preferred to surrender to him the animal which had done the mischief. This practice of surrender, which was applicable also in the case of injuries committed by children under paternal power and by slaves, had its origin in the primitive notion of vengeance against a person or thing that has been the cause of damage. But in course of time the master or owner of the guilty object was allowed to buy off such vengeance by payment of pecuniary damages (see Holmes, *Common Law*, Lecture I.). E. A. W.

PAUPERISM. The word "pauperism" is used in two senses. It is a state, that is a condition, and it is also the sum of paupers. In the first sense it is uniform, it follows a definition and consequently is always the same thing; in the second, it fluctuates from year to year, and from district to district. 1. In the first sense it is a legal term. The pauper in the eye of the law, and in the technical sense, is a destitute person, in receipt of relief administered under the poor law. He is a destitute person, and destitution implies an absence or want of the necessaries of life, food, clothing, shelter. Thus pauperism is clearly distinct from poverty. The poor man is one who, having the necessaries of life, falls short of some standard of comfort, whether that standard be determined by reference to some end, *e.g.* a sufficiency to lead a high type of life, or to the circumstances and average of the time. The rich man of one generation in one century may be the poor man of the next, but the necessaries of life are always the same, when interpreted in the sense of "enough to keep body and soul together." Now to these necessaries every member of the United Kingdom has a right at the hand of the state, a right which is secured to him by a series of acts, beginning with the celebrated 43 Eliz. c. 2. To meet this claim an elaborate machinery or organisation exists, composed of a central authority, now the local government board, and 637 local authorities, viz. boards of guardians with their several administrative officers. On these local authorities lies the obligation to provide for the destitute the means of subsistence, but the conditions under which they do so vary greatly, and will be discussed elsewhere (POOR LAW, ADMINISTRATION OF). The moment that a destitute person has been relieved he is a pauper, and as such suffers certain disabilities, *e.g.* the loss of the right to vote at elections, but no such disability attaches to the receipt of medical relief only. It is true that even government has not always been consistent in its use and interpretation of the terms destitution and pauperism. Thus in a circular of the local government board of the 25th of January 1875, we find it stated that the spirit of administration in workhouses has changed of late years in consequence of a change (i) in the circumstances of the time; (ii) in the character of the recipients of relief. This implies that workhouses are now expected to "move with the times," and to interpret the phrase "necessaries of life" in the light of the average standard of living at the present time. In other words, that destitution has ceased to be the test for the receipt of relief, and guardians no longer confine themselves to "measuring destitution" in the relief which they give. 2. In its other use, pauperism denotes the number of paupers in a country at a given time, a statement which clearly is subject to great variations. With the causes of these variations we need not here deal particularly, but merely remark that they include the state of trade and production generally, and the administration of the law itself among other factors. Pauperism and the amount of it may be reckoned on several bases, *e.g.* the number of persons receiving relief during a given period, or the number of cases, or the number for a given day. For the purposes of comparison it is clearly indifferent which is adopted, provided that the same basis be taken at the two periods, but for the purpose of particular inquiries the distinction is most important. Again the cost of pauperism must often be taken as an index to its amount, in the absence of more accurate statistics. Roughly, the pauperism of England has shown a tendency to increase and decline over certain long periods. From 1601 to a point which may be put at 1750, pauperism on the whole diminished. Thus the cost of maintaining the poor fell from £819,000 in 1698 to £619,000 in 1750, in spite of an increase in population. From 1750 to 1817 the growth of pauperism was rapid and great, the cost rising from £1,912,000 in 1785 to £4,077,891 in 1803, and to £7,810,801 in 1817. From this year onwards a decline takes place, slow at first but more rapid after the passing of the new poor law in 1834. Thus in 1849 the paupers in England and Wales were 6·3 per cent of the population; in 1860, 4·3. The American War raised the percentage to 5·3 in 1863, but by 1873 it had fallen again to 3·8, in 1883 to 3·0, in 1893 it stood at 2·5 and in 1896 at 2·6.

L. R. P.

PAWN, a pawn or PLEDGE (*q.v.*) is where possession of a personal chattel is delivered by one person to another as security for a debt. The general property remains in the pawnor; the pawnee takes the possession and the right to possess. The pawnee may sell the goods on non-payment of the debt after the time fixed for repayment has expired; if no such time has been fixed the pawnor must demand payment before selling. Where a sale takes place the pawnor is entitled to the net surplus after payment of the debt and all expenses. If the pawnor pays the debt he at once acquires the right to possess.

A distinction is drawn between a pawn and a MORTGAGE, of chattels. In the case of a pawn the pawnee acquires only a special or limited property in the goods; in a mortgage the whole property passes subject to a condition that on repayment of the debt the property will be reconveyed. A right of sale is incident to a mortgage of chattels.

A pawnee does not as a rule acquire any greater right to the chattel than that which the pawnor had; but to this principle there are some exceptions contained in the Factors Act

1889. Pawnbrokers are subject to special rules (see PAWNBROKING).

[Goodeve, *Personal Property*, London, 1892.—Turner, *Contract of Pawn*, London, 1883].

J. E. C. M.

PAWNBROKING. This expression denotes the professional lending of small sums on the security of a PLEDGE (*q.v.*). This kind of business, from its nature, is liable to great abuses, inasmuch as it may, if uncontrolled, be made a pretext for the habitual receiving of stolen goods; whilst honest borrowers may be subjected to cruel extortion. For this reason pawnbroking in most countries is either under public supervision or else entirely in the hands of public institutions (see MONTS DE PIÉTÉ).

In Great Britain the enactments relating to this matter were consolidated by the Pawnbrokers Act 1872 (35 & 36 Vict. c. 93), which requires any person who carries on "the business of taking goods and chattels in pawn," or who carries on any business which, though apparently intended for other transactions, is in effect a business for lending money on the security of goods and chattels—in so far as the loans are for less than £10—(1) to take out yearly licenses, which are not granted if the applicant fails to produce satisfactory evidence to character, or if his shop is frequented by thieves or persons of bad character; (2) to use certain prescribed books of account; (3) to exhibit his full name over the outer door of his shop, with the word "Pawnbroker"; (4) to exhibit, in a conspicuous place of his shop, certain regulations as to the conditions and terms on which loans are granted.

The act regulates these terms and conditions; but in the case of loans between £2 and £10, the statutory regulations do not apply if a special contract, the form of which is prescribed by the act, is made between the parties. As regards loans to which the regulations apply, a maximum profit is fixed as well as a minimum term for redemption; and the sale of unredeemed pledges is subjected to certain specified rules. In all cases a pawn-ticket must be handed to the borrower, and must contain particulars as to charges, time and condition of redemption, and other prescribed matters. A pawnbroker is not entitled to take articles in pawn from any person appearing to be under the age of twelve years, or to be intoxicated; he must not employ any person under the age of sixteen years as an assistant; and must not do business on any public holiday. There are, also, special provisions intended to make it more difficult for pawners to pledge goods entrusted to them or stolen by them, and to prevent pawnbrokers from taking such goods in pawn; and a pawnbroker who reasonably suspects any person of not being entitled to pawn an article offered as a pledge, may deliver such person and such article into the custody of a constable. A stipendiary magistrate, or any justices sitting as a court of summary jurisdiction, may order a pawnbroker at any time to produce his books and the papers relating to his business. Disobedience to any rule laid down in the Pawnbrokers Act subjects the person concerned to penalties, varying according to the nature of the offence. If a pawnbroker is convicted of fraud in his business, or of knowingly receiving stolen goods, the court before whom he is convicted may declare his license to be forfeited.

E. S.

PAYEE. The person to whom or to whose order the amount specified in a bill of exchange is payable. If a bill to order is not drawn to the drawer's own order some person must be named as payee.

[Chalmers on *Bills*, London, 1891].

J. E. C. M.

PAYMENT. The term payment primarily means a payment in money. A creditor is always entitled to have his debt paid in legal tender, and is not obliged to take a bill or cheque, or to allow a settlement in account. But "payment" is not a technical term, and it is held to include any settlement of a debt which is treated by the parties on a cash payment, though no money actually passes.

When a bill or note is taken in payment of a debt, the strong presumption is that it is taken as conditional payment only. In that case, if the bill or note is dishonoured, the creditor is remitted to his original rights, and can sue for the debt as well as on the instrument.

M. D. C.

PAYMENT FOR HONOUR. See HONOUR, PAYMENT FOR.

PEACE OF GOD. See TRUCE OF GOD.

PEACOCK, GEORGE (1791-1858), dean of Ely, was the author of an *Algebra*, the parts of which relating to the use of symbols may be consulted with advantage by the mathematical economist. Peacock's doctrine of the negative sign to represent debt has indeed been impugned by Mr. Macleod (*Theory . . . of Banking*, ch. iv. § 2, art. 18); but then Mr. Macleod's own doctrine has been impugned by COURNOT (*Revue Sommaire*). Those who agree with Cournot may employ in Peacock's defence one of the principles which he has enunciated: namely that the subtraction of a negative is positive. The refutation of an adverse criticism amounts to a rehabilitation.

JEVONS also (*Theory*, ch. viii.) has taken exception to the certainly inelegant representation of interest in Peacock's earlier treatise on algebra. The passage was withdrawn by the author from his second edition or version.

A more concrete contribution to political economy was made by Peacock in his review of the agriculture and land tenure of Madeira, which contains much interesting information and reflection; for instance with respect to the metayer system (see MÉTAYAGE).

There is also attributed to Peacock by the writer of his life in the *National Biography*, a pamphlet on the corn-laws (1846), in which it is argued that a free trade would not therefore be a regular trade, it being assumed that our domestic produce is sufficient for our

domestic consumption in two years out of three.

A Treatise on Algebra, 1830.—*A Treatise on Algebra*, 1842-45. — *Treatise on Climate and Meteorology of Madeira*, by J. A. Mason. (Part iv., a review of the agriculture and tenure of land, by Geo. Peacock), 1850.—*Upon the probable influence of a repeal of the Corn Laws upon the trade in Corn*, 1846. (Anonymous; contained in the library of the British Museum under the shelf marked 8245, d. 55).—*Answers to the Questions communicated by Lord Overstone to the Decimal Coinage Commissioners* (Decimal Association), 1857. F. Y. E.

PEARSON, Charles Henry (1830-1894), historian, politician, advocate of land-taxes, and minister for education (1886-1890) in Victoria; wrote *National Life and Character, A Forecast* (1893), in which he prophesied that white men would leave the tropics and be squeezed into the temperate zone, and the squeezing process would fuse different classes in a state socialism which would sap church, family, and individual character, the latter being also menaced by big public debts, armies, and towns. The individual would wither and the race grow more and more, and the old age of the Aryan races, which had already set in, would be passed under "a gray sky." B. Kidd's *Social Evolution* (1894) criticised (p. 323) but resembled this book; both books lay stress on the moral and intellectual sense. Pearson thought that the mind could only postpone and mitigate, Kidd that it could make and avert destiny. Sociologists have written far less important books with far greater scientific pretension on the same subjects.

[C. H. Pearson, *Reviews and Critical Essays*, edited with Memoir by H. A. Strong (1896).—*The National Dictionary of Biography* (1895) *s.v.* "C. H. Pearson" enumerates and appraises his other works.] J. D. R.

PEASANT PROPRIETORS. It has been shown in the article on Morcellement, containing statistics of present landownership, that in France, the country in which, with Belgium, peasant proprietorship exists on the most extensive scale, this institution had existed long previous to the French revolution, though that movement gave it a considerable impetus. It may incidentally be observed that during the most prosperous period of the middle ages, say before the beginning of the Hundred Years' War, tenants in villeinage, so long as they paid their dues to the lord of the manor, whether in money or in kind, enjoyed legally the same security against ejectment as the 19th-century peasant owner who discharges his taxes punctually.

Three principal arguments have been directed against peasant proprietorship: 1st, it does not yield the same returns as farming on an extensive scale; 2nd, it generates low, parsimonious, and avaricious habits of mind; and 3rd, it depresses the birth-rate and interferes with the normal development of population. To each of these complaints a reply has been made: 1st, the return of corn grown by small peasants may be, and probably is, really inferior, but this inferiority does not appear in vegetable and orchard cultivation, which are important in our present agricultural system, nor in the cultivation of vines and such crops as tobacco. If sheep-breeding unmistakably requires extended areas, experience shows that breeding ordinary horses and cattle, as well as poultry, can be managed successfully on small holdings. 2nd, the debased state of mind discovered among the French peasantry by some writers, like Lady Verney in *How the Peasant Owner Lives*, has been grossly exaggerated, and their so-called low style of living is still far superior to that of day-labourers in many countries with large hereditary estates. 3rd, granting that peasant proprietorship acts to a certain extent as a check on population, prudential considerations are quite as prevalent among well-to-do farmers and the inhabitants of towns, and the birth-rate remains high in countries (like Belgium) with a considerable proportion of peasant ownership in land; on the other hand, over-population or *Uebervölkerung*, involving the existence of a miserable urban or rural proletariat, is an unmitigated evil.

Another objection, formerly more solid, is that small peasant proprietors, as a body, are addicted to routine and averse to scientific improvements; and that, even if they were willing to adopt the latter, their means are often insufficient to cover the necessary expenses. However, the diffusion of instruction has decidedly removed this hostility to progress, and association now enables French peasants to use, for instance, steam threshing-machines, and to found, in the east of France, under the name of *fruitières*, co-operative manufactories of cheese, working on the most approved principles; in other places the same organisation is adopted for making butter. If in southern France, after the invasion of the phylloxera, large wine-growers were the first to adopt scientific antidotes to this disease, their example has later on been followed by their smaller neighbours. Small peasant proprietorship is the most powerful incentive to labour; it affords the best opportunity of employing the whole family under the direction of its head, and strengthens family-life. In small and middle-sized farms owned by men working themselves, the "eye of the master" can better observe what is wanting than in very large farms; further, the owner is not tempted, as the farmer may be, to sacrifice the permanent qualities of the soil to gaining immediate but temporary profits; he husbands the fertility of his land, and shudders at the prospect of exhausting it. On

small occupancies, where he only grows corn for the use of the family, he is more independent of market fluctuations. Again, a large body of peasant proprietors affords a steady bulwark against political, and still more against social, turbulence, and, in fact, the leaders of French COLLECTIVISM, finding that it is expedient not to frighten this class of voters, have several times ostentatiously protested that they intended to respect the right of private property for small fields tilled by their owners; this respect, however, does not prevent jealousy of wealthier neighbours, so that this safeguard is not to be relied on absolutely.

To conclude, if some of the preceding remarks are alike favourable to peasant proprietorship and to cultivation by small tenant-farmers, this is not the case with all of them. Small tenants, especially tenants at will or for a very short term of years, are necessarily deficient in the feeling of independence and self-reliance, as well as in the incentive of future hopes, which are the most happy characteristics of the former system. Large and middle-sized ownership in land, as well as cultivation by affluent landlords, or by farmers possessed of the necessary means, may of course also be maintained; what is contended is that each mode of cultivation has its proper sphere of action, and that none ought to be indiscriminately rejected.

In former times, except by Francis Bacon in the essay on the *True Greatness of Kingdoms*, peasant proprietorship was rather looked upon with distrust in England. Though in his *Tour through France*, Arthur YOUNG admits that the magic of property suffices to turn sands into gold and rocks into scenes of fertility, he is a strong upholder of the English system of extensive estates, either cultivated by a rich landlord or by farmers provided with a large capital: "Deduct from agriculture all the practices that have made it flourishing in this island, and you have precisely the management of small farms" (*Eastern Tour*, vol. ii. p. 161). Malthus, inclining to believe that "all the great results in political economy depend upon proportions," admitted that "the division of landed property to a certain extent is of the utmost importance," but apprehended that the "owners of the minute divisions of landed property [in France] . . . must perish in great numbers in every scarcity," if "the effects (of this division) should not be weakened by the operation of an extraordinary degree of prudence in marriage" (*Principles of Pol. Econ.*, pp. 432-434, ed. 1820). Adam Smith, on the other hand, had observed that "a small proprietor, who knows every part of his little territory . . . is generally of all improvers the most industrious, the most intelligent, and the most successful" (*Wealth of Nations*, bk. iii. ch. iv.). But, excepting writers of democratical tendencies such as GODWIN (*q.v.*), English economists of high standing have mostly followed in the footsteps of Arthur Young. Nevertheless, towards the middle of this century, a reaction, initiated by and based on such works as Kay's *Social Education and Condition of the People*, Laing's *Journal of a Residence in Norway*, Howitt's *Rural and Domestic Life of Germany*, Thornton's *Plea for Peasant Proprietors*, etc., set in and found a powerful expression in the chapters devoted by J. Stuart MILL to peasant proprietors in the second book of his *Principles of Political Economy*. Since those days similar views are to be met in the collection of essays printed by the Cobden Club under the title of *Systems of Land Tenure in Various Countries* (1870), and have found another exponent in Professor Thorold ROGERS (see for instance *England's Industrial and Commercial Supremacy*, 1892, pp. 314 and 350).

On the whole, German economists may also be said to be favourable to small agricultural landowners; a general survey of the literature on the subject will be found in Roscher's *Nationalökonomik des Ackerbaues* (p. 197, ed. 1888). He himself declares that a judicious mixture of large, middle-sized, and small estates constitutes the economically soundest system for a nation (*ib.* pp. 188-189); see also "Bauerngut" and "Bodenzersplitterung" in Conrad's *Hdwb. der Staatswissenschaften*.

In France, the physiocrats, and especially the founder of the school, QUESNAY (*q.v.*), have been the only systematic admirers of the English system, on the principle that the *grande culture* yields much more than the *petite culture* (see the latter's articles "Fermiers," "Grains," and "Maximes Générales du Gouvernement Économique" in Quesnay, *Œuvres*); however Quesnay steadily assumes that corn is to be the leading produce of the *royaume agricole*. TURGOT also contends that the method of cultivation by rich farmers is the most advantageous; still he adds the proviso "supposing that the country be already a rich country" (§ xxvii. of the *Réflexions sur la Formation des Richesses*). Carried away by his admiration for the variety of the crops produced by the soil of France, MIRABEAU the elder, on the opposite side, advocated the extreme division of land: "How different the fertility of a small domain, which sustains a hard-working family, and that of huge estates abandoned to passing farmers or to lazy and indolent agents! . . . The subdivision of land cannot be pushed too far in a *canton*; this difference between the *tuum* and the *meum* . . . is the principle of vivification of a state" (*Ami des Hommes*, p. 46, ed. Guillaumin). Without going to this extremity, it may be broadly stated that from the first quarter of the present century, the great majority of French writers on agronomy have, like ROSCHER, looked favourably on small culture and peasant proprietorship co-existing with a due proportion of large and middle-sized agricultural estates, from Sismondi, *Tableau de l'Agriculture en Toscane* and *Nouveaux Principes d'Économie Politique*; Gasparin, *Des Petites Propriétés* (1821); De Barante, *Des Communes et de l'aristocratie* (1821); Hippolyte Passy, *Des systèmes de culture en France* (1846 and 1853) (see the appendix on the repartition of territorial property), to Lavergne's *Économie rurale de la France*; Baudrillart's *Populations agricoles de la France* (1885); De Foville's *Morcellement*, and the latter's and MM. Bernard's and Zolla's articles in the *Nouveau Dictionnaire d'Économie Politique*

(1892). Both sides of the question are ably summed up by M. Paul Leroy Beaulieu in his *Traité théorique et pratique d'Economie Politique* (vol. ii. pp. 1-30).

In Italy the flow of ideas has generally been in favour of peasant proprietorship down from the days of Verri (*Meditazioni sull' Economia politica*, 1771), and of Filangieri (ch. iii. and iv. of the *Leggi politiche ed economiche*, 1780). In our own days, Professor Achille Loria considers the constitution of exclusively small proprietorship in land resulting from the gradual disappearance of rent, to be the further and natural result of contemporary social and economic evolution (*La rendita fondiaria e la sua elisione naturale*, 1880).

[For further bibliographical information on peasant proprietorship in France, see the bibliography of MORCELLEMENT.] E. Ca.

PEASANTS' REVOLT. This rising, one of the most striking episodes in English history, is remarkable alike for the variety of causes which produced it; the mysterious character of its organisation; the widespread area which it affected; the absence of any unity, whether of purpose or of action, displayed by its leaders; and the many cries, political, religious, social and economic, to which utterance was given.

The immediate causes, the pressure of heavy taxation culminating in the levy of two poll-taxes, and the unpopularity of the government, were indeed political; but the deeper reasons are closely connected with the economic changes produced by the BLACK DEATH (*q.v.*). The scarcity of labour consequent on that pestilence led to many attempts to enforce more strictly the old agricultural services due from tenants, and possibly even to revert to them in cases where they had been commuted for money payments; while parliament tried to meet the emergency by stringent statutes regulating labour and the rate of wages. These measures were resisted, and the discontent, fanned by the teaching of Wiclifites and of friars, led to open rebellion in June 1381 upon the imposition of a second poll-tax.

The rising affected Norfolk, Suffolk, Cambridge, Essex, Hertford, Middlesex, Hants, Sussex, Kent, Somerset, Huntingdon (*Rot. Parl.*, iii. 111 *et seq.*); Devonshire (Knighton), Lancashire, York, Lincoln, and Durham were prepared to join, although we only hear of tumults at Beverley and Scarborough (Stubbs, ii. 489). Of the details connected with an organisation which embraced so wide an area, and was capable of simultaneous action, we know little. It was probably due, partly to the associations created to set aside the statutes of labourers (see LABOUR STATUTES), partly to the Wiclifites and friars whose wandering habits rendered them useful disseminators of information, and partly also to the discharged soldiers who had some experience of risings against authority in France and Flanders (Stubbs, *Const. Hist.*, ii. 491).

In Kent, where VILLEINAGE was unknown (Stubbs, ii. 489), and in London the movement was against heavy taxation and the misgovernment commonly attributed to John of Gaunt, but in the eastern counties the chief grievance alleged was that of villeinage. The insurgents demanded the abolition of villeinage and of tolls, a general pardon, and the commutation of villein service for a rent of not more than 4d. an acre. The attack was directed against landlords, both lay and clerical, and included the destruction of muniment rooms and documents, which preserved record of the obnoxious services (see SERVICES, PREDIAL AND MILITARY). The violence of the rebels at Bury St. Edmunds and St. Albans is graphically described by Walsingham (*Hist. Anglicana*, i. ii.; *Gesta Abbatum*, iii.).

The course of the rising is a matter of political history, and in this place it may be sufficient to note that it was quelled within a fortnight, and that the king (Richard II.) speedily revoked the charters of manumission and pardon conceded under the influence of panic, a measure subsequently approved by parliament (*Rot. Parl.*, iii. 100). The result must from the standpoint of the economic historian be regarded as a failure. Though villein service gradually died out, this was due, not to the rising, but to the influence of other forces, some of which had begun to operate before this time, although the change may have been accelerated by the difficulty of enforcing unwilling service. The history of the decay of manorial organisation has not been fully worked out, but it seems clear that as more profitable and more economical methods of working the land as pasture were widely adopted in consequence of a greater demand for native wool, the necessity for exacting the old services was lessened (see MANOR). In some cases villeins abandoned their holdings (F. W. Maitland in *Eng. Hist. Rev.*, ix. 425), attracted probably by more profitable openings in the towns, and thus the difficulty of maintaining the *status quo* on the manors increased. Under these circumstances commutation became general, and the villein became the copyholder as we know him in the 15th and 16th centuries; although from Fitzherbert's description (*On Surveyinge*, c. xiii.) and from isolated cases (Cunningham, *Growth of Engl. Industry*, i. 402, 533) it would seem that bondmen (see SERVUS) were still to be found in the 16th century, and even later, whose position differed but little from that against which the villeins of 1381 had made their protest (M. Kovalesky in *Archæological Review*, i. 444).

PECCHIO, Giuseppe (1785-1835). Was born in Milan, a member of a noble family; he held important offices, and was exiled in 1820 for his political opinions. He lived a long time in England. His name is known to students of the history of economics for his sketch of the history of political economy in Italy; this work was much read and appreciated, as is shown by several editions, and a translation into French; the success of the work was, however, perhaps beyond its merits. The author endeavours to condense into one volume the most important subjects in the large collection of Italian writers on economic matters, published at the beginning of this century by Baron Custodi. This collection was left incomplete, and Pecchio also did not finish his work. To expound superficially in a series of biographical and bibliographical sketches the lives and principal theories of a certain number of authors does not by any means constitute a history of the science.

Pecchio was also the author of another historical work on the finance of the first Italian kingdom.

Saggio storico sull' amministrazione finanziera dell' ex Regno d'Italia dal 1802 al 1814, London, 1822 (published in other editions).—*Storia dell' economia pubblica in Italia*, Lugano, 1829 (published several times, finally in Turin, 1852; translated into French, Paris, 1830). U. R.

PECQUEUR, Constantin (1801-1859), born at Arleux (Nord), died in Paris.

Originally a follower of Saint Simon, then of Fourier, he did not definitely enrol himself in any school, preferring to follow his own bent, but by so doing he became entirely isolated. In his writings, while he aimed at, and even to some extent attained being practical, yet he tended more and more towards an ideal religious and mystic communism.

His first work, *Des intérêts du commerce, de l'industrie et de l'agriculture et de la civilisation en général sous l'influence des applications de la vapeur*, 2 vols. 8vo, 1st ed., 1838, 2nd ed. 1839, received a prize in 1838 from the Academy of Moral and Political Science. The originality and the not infrequent directness of insight of the work deserved this. In his second work, *Des améliorations matérielles dans leurs rapports avec la liberté*, 18mo, 1st ed. 1839; 2nd ed. 1847, Pecqueur evinces a more progressive and liberal spirit. This work, though antiquated, deserves to be read. Besides a pamphlet *Lettres à M. Dufaure sur les chemins de fer*, he wrote a large volume 8vo, published in 1842 under the title of *Théorie nouvelle d'économie sociale et politique ou étude sur l'organisation des sociétés*, in a more serious strain, and it is to be regretted that he did not act more in concert with the economists, his contemporaries, as Michel Chevalier did some years later, instead of waging war against the mistakes and prejudices of his time. After having written two works in which political economy only takes a second place, *De la paix de son principe et de sa réalisation*, 8vo, 1842, and *Des armées dans leurs rapports avec l'industrie, la morale et la liberté*, 8vo, 1842, he published, in 1844, *De la république de Dieu*, a small volume in 18mo, in which his Christian socialistic views are prominent. In 1849 he published a paper *Le salut du peuple*, which only reached a few numbers. His views, and the scientific value of his works, place him in an intermediate position between the socialists of his time and the economists of the liberal school. A. C. f.

PEDIDO. See Moneda, Pedidos or Servicios.

PEDLAR. Pedlars are persons who travel about from house to house offering goods for sale. They differ from hawkers in that the latter travel with horses. By the Pedlars Act 1871 (34 & 35 Vict. c. 96) a pedlar requires a certificate from the chief officer of police, but he is exempt from excise duty. A hawker pays £4 per annum for each horse employed. J. E. C. M.

PEEL, Sir Robert (1788-1850), statesman and financier, was the eldest son of the first baronet of the same name. He took a double first at Oxford in 1808, and the next year entered the House of Commons as member for Cashel. His prudence, tact, and general business-like qualities soon made themselves felt. In 1811 he became secretary for the colonies, and he held the office of secretary for Ireland from 1812 to 1818. Here he opposed the practice of selling public offices, and of dismissing civil servants for political action, and established the body of police afterwards consolidated into the Royal Irish Constabulary.

In 1818 Peel resigned office, but as a private member carried in the following year the first of his important economic and financial measures. Being appointed chairman of the committee on currency, which also inquired into the state of the Bank of England, he moved the resolutions which led to the resumption of cash payments (see Banking). During the restriction of cash payments (1797-1821), the notes of the Bank of England had been at one time depreciated in value no less than 20 per cent, and were valued only at 16s. in the £1 as compared with gold. Peel's bill for the resumption of cash

payments was passed in 1819. It was to have come into effect in 1821, but its provisions were previously adopted spontaneously by the Bank of England.

In 1822 Peel re-entered the ministry as home secretary, but withdrew with the Duke of Wellington in 1827, when Canning became head of the government. On the death of the latter, the Wellington-Peel administration was formed. In 1828 Peel had created the metropolitan police force, claiming that by this act for indirectly preventing the increase of crime he was paving the way for a considerable mitigation of the criminal law. In November 1830 the government went out of office, having been defeated on a motion to revise the civil list.

Towards the close of 1834, William IV. dismissed his Whig ministers, and Peel became first lord of the treasury and chancellor of the exchequer. In April 1835 he resigned, having during his short term of office established the ecclesiastical commission.

While in opposition he was so powerful that one of his opponents declared "the right honourable member for Tamworth governs England."

After the defeat of the government in 1841 Peel came in at the head of his memorable administration. Fiscal reform was one of his chief aims, and in 1842, assisted by Gladstone, he brought forward his great scheme of a revised tariff. The country warmly welcomed the relief afforded in the reduction or removal of many items of taxation. But one part of the scheme was not so popular. Peel found himself compelled to establish an INCOME TAX on all incomes of £150 a year and upwards. This tax was not new; it had been imposed by W. PITT, and Peel urged that it was once more demanded both on grounds of national honour and of administrative prudence. The relief of taxation in other ways, however, was quite unparalleled, for out of 1200 articles comprised in the new tariff, the duties were reduced on 750. Peel still maintained the sliding scale of duties on foreign corn, but modified it by changes in the method of fixing the averages of prices, and by lowering the protection afforded on the different degrees of the scale to home-grown wheat. The maximum protective duty, which had been 27s. per quarter when home-grown wheat was under 60s. per quarter, was reduced to 20s., and was only to take effect when wheat was under 50s. After protracted debates the ministerial proposals were carried, and the public funds at once rose from 89 to 93.

In the session of 1844 Peel brought forward his measure for the revision of the bank charter. It was practically a reorganisation of the Bank of England (see BANKING). An act had been passed in 1833 which maintained the Bank of England in its privileges until 1855, with the provision that, ten years after the date of the measure, parliament might revise the charter. The ten years had now elapsed, and Peel produced a revised scheme, which was carried. The charter was renewed till 1st August 1855, or longer, if the debt due to the bank, £11,015,100, with interest, etc., were not paid after due notice; the issue department was established; weekly returns were required to be published; the issue of notes was limited to £14,000,000 on securities. Thus Peel had the satisfaction of accomplishing the monetary reform which he began in 1819. Events have not, however, entirely fulfilled his anticipations. Three times since 1844—in 1847, 1857, and 1866—a relaxation of the Bank Act has been compulsorily agreed to (see BANKING), although only on one of these occasions, in 1857, was the strict limit of the law overpassed. More than once important alterations in the measure have been proposed, though none as yet have been made.

Ireland was the next subject which occupied his thoughts. In 1843 Peel appointed the well-known Devon commission to inquire into the state of the law and practice with respect to the occupation of land in Ireland. The report presented in 1845 revealed for the first time the cause of the distressed state of Ireland.

Peel supported Sir J. GRAHAM'S factory legislation (FACTORY ACTS). In February 1845 his budget continued the income-tax calculated to produce £5,200,000, while in the customs duties, abolitions and reductions were effected amounting to £3,338,000. The alteration of duties on four articles—sugar, raw cotton, coal for export, and glass—occasioned a diminution in the revenue of £2,740,000. The import duties on 430 articles were entirely abolished, resulting in a loss of £3,500,000 (see CUSTOMS DUTIES). But after all reductions, there was still a surplus of £71,000 at the end of the financial year 1845-46.

Meanwhile, the much-agitated question of the corn laws was rapidly requiring a settlement. The potato famine in Ireland during autumn 1845, followed by many deaths, rendered cheaper corn necessary. Peel, deeply impressed by the condition of Ireland, proposed in the session of 1846 the gradual repeal of the corn laws, complete free trade in corn to take final effect after three years (see FREE TRADE). The minister was again acrimoniously assailed by his friends, and on the day that the corn law bill was passed in the Lords the government were defeated in the Commons. For a time the power of the Conservatives was annihilated—perhaps the most striking example in English modern political history of the success of a great economic principle leading to

the defeat of the political party which had supported it.

Peel resigned office, but while in opposition he cordially supported the new Whig government in their measures for practically abolishing the navigation laws, for relieving the Jews from their political disabilities, and for the promotion of popular education. Peel was not a brilliant orator, but he had great weight as a wise and sagacious party leader, and his personal character stood high. His services to the state were great and enduring, and if he was at times an opportunist, it was always with an eye to the national interests, and never from any desire for personal aggrandisement.

[Only Peel's economic measures can be dealt with here; for his other public measures see *Memoirs* by Peel, edited by Lords Stanhope and Cardwell.—*Life* by Viscount Hardinge and A. W. Peel (Speaker), edited by C. S. Parker.—*Biographies* by Cooke Taylor, Sir Laurence Peel, Lord Dalling, G. Barnett Smith, F. C. Montague, Justin M'Carthy, J. R. Thursfield, etc., the *Annual Register*, 1850; articles in the *Nineteenth Century*, the *Edinburgh* and *Quarterly Reviews*.—*Dictionary of National Biography*, the *Westminster Review*, etc.] G. B. S.

PELLS. The office of clerk of the pells, so called from the pells or sheepskins on which the records of the office were written, was one of the most ancient in the exchequer. The clerk of the pells was originally the Treasurer's own private clerk, and it was his duty to keep separate records of all moneys entering and leaving the exchequer. These records were kept on two rolls, called respectively the *pellis introitus* or Pells receipt roll, and the *pellis exitus* or Pells issue roll. On the former was entered every sum paid into the exchequer, with the receiving teller's name, copied from the TALLY, or in later times the teller's bill, as it was thrown down into the tally court; while all payments out, with the authority for making them, were similarly entered on the issue roll. The duties of the office remained essentially the same till its abolition on the remodelling of the EXCHEQUER in the present century.

PENNI (Finland). The hundredth part of the MARKKA (*q.v.*). F. E. A.

PENNINGTON, JAMES (1777-1862):

An economist, was the author of a paper on deposits with bankers, published in T. Tooke's *Letter to Lord Grenville on the Currency*, 1829, also of a letter further elucidating his opinions, to be found in Appendix C. of vol. 2 of Tooke's *History of Prices*, pp. 369-378. His views, expressed in 1827, contain the germ of the Bank Charter Act of 1844, but he was opposed to the separation of the departments of the Bank of England (BANKING; BANK NOTE). Pennington further published a pamphlet, addressed to Mr. Finlay, on *Corn Laws*, 1840, and a work of authority on *The Currency of the British Colonies*, 1848, 8vo.

[*Annual Register*, 1862, p. 390.—*Economist*, 19th April 1862.] H. E. E.

PENNY (English). The Anglo-Saxon penny was a silver coin, 240 of which weighed a pound (5760 grains), twenty-four grains, the weight of a penny being then, as at present, known as a "penny-weight." The origin of the term penny is obscure, but in all probability it was derived from *pendo* (*to weigh*). The word was variously spelt in Saxon and Norman times, *i.e.* penig, pening, penning, peneg, pending, etc.; its modern representatives being but slightly different: *English*, penny; *German*, pfennig; *Danish*, penge; *Finnish*, penni.

The successive alterations in the legal weight of the silver penny, from the time of the conquest onwards, as given by Ruding, are shown in the following table. The last silver penny coined for general circulation was struck in the reign of Charles II., after which time these coins were issued only as a part of the special moneys distributed on Maundy Thursday (see MAUNDY MONEY).

SILVER PENNY.

Reign.	Weight.	Value.	
		In silver 925 fine, at 5s. 6d. per oz.	In silver francs 900 fine.
	grains.	penny.	franc.
William I., 1066 .	22½	3·09	·299
Edward I., 1300 .	22	3·02	·293
,, III., 1344	20½	2·78	·270
,, ,, 1346	20	2·75	·266
,, ,, 1351	18	2·47	·240
Henry IV., 1412 .	15	2·06	·200
Edward IV., 1464.	12	1·65	·159
Henry VIII., 1527	10½	1·44	·139
,, ,, 1543	10	1·37	·133
Edward VI., 1552.	8	1·10	·106
Elizabeth, 1601 .	7¾	1·06	·103

A gold penny was struck in the reign of Henry III. (1257), weighing 45 grains of fine gold. It was rated as the equivalent of twenty silver pence. Measured by the present gold standard (1 oz. = £3 : 17 : 10½) its value would be as much as 7s. 11½d.

The first copper penny, a piece weighing 1 oz. avoirdupois, was struck in the reign of George III. (1797) (see COPPER MONEY, ENGLAND).

[Ruding's *Annals of the Coinage*, 1840.] F. E. A.

PENSIONS.

Pensions, General Character, p. 88; Perpetual or Hereditary Pensions, p. 89; Civil Service Pensions, p. 89; Political Pensions, p. 90; Judicial Pensions, p. 90; Civil List Pensions, p. 90; PENSIONS, OLD AGE, p. 90.

A pension, according to Dr. Johnson's famous definition, was in England "generally understood to mean pay given to a state-hireling for

treason to his country." This would not have been true of the pension which Johnson himself subsequently received, nor of a considerable, though perhaps not the largest, portion of those granted in his time; it would not now be true of any. A modern pension is as much a payment for undoubted services as salary or wages, the difference being that pensions are paid in respect of *past*, salary or wages in respect of *present*, services. In England a certain number of persons in private employment, and the majority of persons in government employment, are remunerated partly by salary or wages, and partly by deferred pay in the shape of pensions. When, therefore, the conditions of service include a right to pension, the salary or wages must be assumed to be less than the full market rate, the difference representing the value of the pension.

The total cost of the pensions, and of gratuities in lieu of pensions, in the services of the crown in the United Kingdom, is known as the non-effective charge of those services. In the estimates presented to parliament for the financial year 1907-8, the proportion of non-effective charges was as follows, viz.:

	Total Charge.	Non-Effective Charge.
Army . . .	£27,272,000	£3,596,000
Navy . . .	31,419,500	2,510,800
Civil Services and Revenue Departments . .	50,732,785	2,071,501

Besides the amounts thus annually submitted to parliament, which is at liberty to vote or not to vote them without any breach of positive law, there are certain pensions, charged by statute on the consolidated fund, for judicial officers and certain others, whose independence is deemed to be better secured by this arrangement. The total amount issued for pensions out of the consolidated fund during the financial year 1906-7, was £177,468. A complete list of such pensions, with the names of the recipients, is set forth in the annual "finance accounts," published by authority.

Perpetual or Hereditary Pensions.—The British government formerly rewarded eminent public services by the grant of a pension, usually accompanied by a peerage, and payable not only during the life of the original grantee, but to his heirs for ever. Thus hereditary pensions were granted to the first Duke of Marlborough, to Lords Exmouth and Rodney, and to the brother of Lord Nelson (after the death of the latter at Trafalgar); payable in perpetuity to all heirs of the original grantees to whom those titles should descend. In the Stuart times royal favour was sometimes signalised in the same way. Thus hereditary pensions were enjoyed down to the present day by two peers, as the heirs of natural sons of Charles II. Some years ago the late Mr. Bradlaugh, M.P., inveighed against these perpetual payments, and a committee of the House of Commons was appointed to enquire into the subject. A treasury minute presented to the House on 20th July 1888 (House of Commons paper 292 of 1888) sets forth the recommendations of this committee, and the extent to which they had been adopted by the government. Steady progress has since been made with the process therein indicated of commuting hereditary pensions, by arrangement with those interested, of course at a fair market value; and the only pensions now (1907) remaining, which have a currency beyond the lifetime of the present recipients, are those to the heirs of the Duke of Schomberg (£720), to Lord Rodney (£2000), and to Earl Nelson (£5000)—in all £7720, chargeable on the consolidated fund.

Army and navy pensions, or, as they are officially termed, *retired pay*, are granted by the secretary of state for war and the lords commissioners of the admiralty respectively, according to conditions prescribed by royal warrant for the army, and by orders in council for the navy. These conditions may be varied by the sovereign from time to time by amending warrants or orders in council, but so long as they remain in force they cannot be departed from in any particular at the pleasure of the executive. The retired pay of the officers, non-commissioned officers, and men of the army and navy depends on the rank attained by the recipient and on the length of his service, with special additions for wounds received in action, or for physical breakdown caused by the nature of the service. There is, also, a strictly limited number of special pensions for distinguished service, known as "good service pensions." No infirmity or unfitness for duty is necessary, as in the case of the civil service, to enable retired pay to be granted in early middle life, as the *men* are discharged on the completion of their term of engagement, while *officers* are automatically placed on the retired list on reaching certain ages, which vary according to the rank of the officer.

Civil Service Pensions are granted by the treasury under conditions prescribed by act of parliament. The acts dealing with the subject are very numerous; the principal are the superannuation acts of 1834, 1859, and 1887, especially the act of 1859 (22 Vict. c. 26). Of this act, which governs the great majority of civil service pensions, the main principles are as follows, viz. (*a*) pension only to be granted on the attainment of sixty years of age, or on the abolition of the office, or on an officer becoming permanently incapacitated, by infirmity of mind or body, for duty; (*b*) after less than ten years' service no pension to be granted, but a gratuity of a month's pay for each year of service; (*c*) for ten years service or upwards the rate of pension to be not exceeding one-sixtieth of the retiring salary or wages for each year of service, subject to a maximum of two-thirds of such retiring salary or wages; (*d*) the full rate of pension not to be granted unless upon a certificate from the authorities of an officers' department to the effect that he has served "with diligence and fidelity, to their satisfaction"; (*e*) any officer to whom a pension is granted under the age of sixty to be liable to serve again if required.

When a civil servant—an expression which includes, for pension purposes, such widely different classes as *e.g.* consuls, clerks, postmen, and workmen in dockyards—is injured, without his own default, on duty, and from some accident arising from the nature of his duty, the treasury is empowered by the Superannuation Act of 1887 to make a special addition on that account to his pension, or to award him a gratuity, by way of compensation, in cases in which no pension can be granted. If he dies from the injury, a pension can be awarded to his widow, or to his mother, if he leaves no widow, and if his mother was wholly dependent upon him.

All persons serving in public civil departments are not entitled, without distinction, to pensions. A considerable number are engaged at the full market rate of wages, without any pension rights. By the Superannuation Act of 1887 already referred to, the treasury is empowered, subject to certain conditions, to award gratuities to such persons, on the termination of their employment, at the rate of a week's pay, or one pound, whichever is greater, for each year's service.

Certain classes of pensions deserve special notice: (1) *Political Pensions*—These may be granted to persons having held certain high political offices, such as that of first lord of the treasury, chancellor of the exchequer, secretary of state, president of the board of trade, or any other of what are generally known as ministerial offices. The pensions are of three classes. A first-class pension is £2000 a year, a second-class £1200 a year, and a third-class pension £800 a year. The class of pension awarded depends on the office held, and on the length of service therein. No award can be made unless upon a declaration that the recipient's other resources are not sufficient to maintain his station in life. Only one political pension can be granted in any one year, and the total number in force at any time must not exceed four of each class. The awards are made by the treasury, under the political pensions act of 1869, and are charged upon the consolidated fund. (2) *Judicial Pensions* — Any judge, on completing fifteen years' service, or on becoming permanently incapacitated for duty, whatever the duration of his service, may be granted a pension equal to two-thirds of his salary, chargeable on the consolidated fund. (3) *Civil List Pensions*—These pensions are granted by the sovereign upon the recommendation of the minister, generally the first lord of the treasury, and paid out of a special sub-head of Her Majesty's civil list. The limit of pensions to be granted in any one year is £1200 per annum. Under the act 1 & 2 Vict. c. 2, § 6, the pensions are to be granted to "such persons only as have just claims on the royal beneficence, or who by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude of their country." (4) *Old Age Pensions*—A movement has grown into prominence of recent years in favour of a system of pensions in old age for the whole community, or at all events for the less affluent majority thereof. No scheme has as yet been authoritatively propounded, though the question was referred to a committee of experts. The difficulties of the problem are gigantic. (See PENSIONS, OLD AGE.) J. P. C.

PENSIONS, OLD AGE.

England, p. 90; Mr. C. Booth, p. 90; Modifications of Mr. Booth's plan, p. 90; Contributory Schemes, Canon Blackley, Mr. Jos. Chamberlain, p. 91; Germany, p. 91; Denmark, p. 91; France, p. 91.

England.—The case for some scheme of old age pensions can hardly be put more forcibly than in the words of the report of 1895. "It appears from existing statistics that nearly 20 per cent of the total population above the age of sixty-five receive relief in one day, and nearly 30 per cent in the course of one year. If, however, a deduction be made from the total population of those belonging to classes which are not likely at any time of their lives to be in want of relief, it is evident that the percentage of those actually relieved to the population below the well-to-do must be greatly increased." In order to meet this large amount of aged pauperism a number of schemes for state-aided or state-provided pensions for old age have been laid before the public.

Mr. C. Booth's Scheme.—The most complete and comprehensive of these is that suggested by Mr. Charles Booth. His proposal is, that, subject to certain limitations, every person, male or female, on attaining the age of sixty-five, shall be given for the remainder of life a sum of 5s. weekly, out of public funds. He contends that this amount will not be sufficiently large to discourage thrift, while the fact that it is offered to all alike on the single condition of having attained the age of sixty-five, will avoid the necessity of invidious and difficult distinctions between rich and poor, or deserving and undeserving. Moreover, unlike the contributory schemes, it will at once reach the class which is most in need of help. The first and most important objection to this scheme is its enormous cost. Mr. Booth himself admits that the annual expense in England and Wales would be nearly £18,000,000. If Scotland and Ireland were added they would reach £24,500,000, while the direct saving as regards poor-law expenditure upon the aged is not estimated at more than £2,000,000. These figures alone seem to place the scheme beyond the range of practical politics, even if it were free from the economic objections which have been raised against it. Moreover, the absurdity of paying 5s. a week to the wealthy is obvious, yet it seems impossible to draw a line which would not lead to that further separation of classes and masses which it is the main object of such a scheme to avoid. There are also minor objections, such as the difficulty of obtaining satisfactory proof of age, and the complicated and probably costly system of administration which so large an undertaking would involve.

Modifications of Mr. Booth's Plan have been suggested by Mr. Hardy and Mr. Leslie Probyn, who propose that the pension-right should be recognised only for the proved impecunious aged, or, Mr. Probyn's amendment, by supplementing the income of any acquired property up to some reasonable limit. The pension is estimated at 10s. a week, and the pensioner must be over sixty-five and must give up all work. The chief objections to this are that so large a pension, from which savings would be deducted, would materially lessen the stimulus to thrift, and that in all probability very few aged persons would work if they could obtain 10s. a week on the sole condition of not working. The first should be a fatal objection to any scheme, and the second seems to show that the expenses would be little less and the advantages scarcely greater than those of Mr Booth's plan. Other proposals have been made by Rev. Frome

Wilkinson and Mr. Bartley, M.P., but both involve an enormous amount of discrimination and investigation as well as very heavy expenses.

Contributory Schemes.—Canon Blackley had earlier (see 1887 *Inquiry*), advocated a scheme of compulsory insurance, by which all young persons from eighteen to twenty-one should be required to contribute to a state-collected or state-secured fund, a sufficient amount to entitle the contributor to a pension at some fixed age. In considering this, it is evident that a compulsory scheme must be universal, and that it is practically impossible to obtain contributions from those who are unemployed, or only in casual employment. It is also probable that such a scheme would be exceedingly unpopular with the working classes, even if the amount required were within their scope.

The most important of the contributory schemes is that associated with Mr. Jos. Chamberlain's name. This contemplates three classes of pensions. The first, a pension of 5s. a week, payable at sixty-five, is obtained by the payment of a lump sum of £2 : 10s. before twenty-five, and subsequent annual payments of 10s. for forty years. The state credits each contributor at 25 with a bonus of £10, both sums accumulate at compound interest and provide the annuity of £18 per annum at the age of sixty-five. Payments of the second class, which are twice as large, provide not only for the pension of 5s. but also for certain other benefits, of which the most important are payments to widows and children in case of death. The third case provides "that any person after depositing 30s. if male, 25s. if female, into the post office, and insuring in any society for £6 : 10s. or £3 : 18s. respectively, shall have his or her pension doubled at sixty-five by the state," and aims at securing the co-operation of the Friendly Societies. The main objections to Mr. Chamberlain's scheme are, (1) that it would not affect the classes which are most in need of help, and would merely act as a new form of insurance for those who are already able to provide for old age. (2) The scheme would have no direct effect for forty years, and if any measure at all is required it is one which can come into speedy operation. (3) The expenses of administration would be exceedingly heavy. (4) With regard to the third case, the friendly societies regard any scheme of state subvention with extreme suspicion, as likely to involve state interference, and their influence is too important to be disregarded.

It appears then that no scheme hitherto laid before the public is free from very grave objections. The question remains whether any scheme of state pensions is really necessary, or whether, on the other hand, it is not possible to hope that existing institutions will furnish the true solution of the problem. In the first place, the statistics of old age pauperism are somewhat misleading, for (1) a considerable number of applications may have been made by one person, (2) much aged pauperism is due to chronic infirmity which needs special care, and cannot be treated outside the workhouse, (3) more than two-thirds of the whole number of aged paupers are receiving out-door relief, and no doubt many of these ought to be maintained by private endeavour. The annual reports published by the local government board show a marked and steady decrease in the numbers of paupers, due both to improved economic conditions and to stricter administration of the poor law. Much, probably, is to be hoped from careful administration, together with the co-operation of the poor-law authorities with charitable institutions, as at Whitechapel, St. George's-in-the-East, or Brixworth; and evidence shows that charity, both private and endowed, is directly stimulated by strict administration. The amount available from endowed charities alone is estimated at nearly £100,000 per annum, and that from voluntary charity is also extremely large, while the value of voluntary work in charity organisation can scarcely be overestimated.

While well-directed charity and careful administration may be expected to do much for the poorest classes, those which are slightly better off profit much and might profit more by friendly societies. Evidence shows that there is practically no class which cannot afford to belong to a society, and if members begin to insure at an early age the payment required is exceedingly small. Should an effective demand for pensions arise, the great friendly societies, the management of which is steadily and greatly improving, are admirably adapted to meet it. Most trades unions provide superannuation for their members, the number and scope of thrift agencies, such as building societies or co-operative societies, is steadily increasing, while the post office provides facilities for the purchase of annuities or for small savings. A committee of experts—Lord Rothschild (chairman), Sir F. Mowatt, Sir C. Boyle, Sir Spencer Walpole, Mr. Finlaison, Mr. Brabrook, Mr. George King, Mr. A. W. Watson, and Mr. A. Chapman—considered the whole question, and their report (1898), on the whole, was unfavourable.

Germany.—The German scheme, which came into operation under the law of May 1889, makes insurance compulsory, broadly speaking, upon all wage-earners, while certain other classes have the option of insurance (for particulars see INSURANCE, STATE (Germany)). The scheme is worked by means of insurance cards through the post office, and great care has been taken to avoid over-centralisation, the main burden of administration falling on local institutions. Time alone can show how the experiment will work, but the *prima facie* difficulties seem to be the extreme complication of the procedure and the comparative inadequacy of the results. The pension is very small; contributions cannot be exacted from the casual or irregular worker; and no provision is made for widows and married women.

In *Denmark*, under the law of 1891, pensions are awarded only to persons who can prove that during the previous ten years they have been neither in receipt of poor-relief nor convicted of mendicancy. They must be over sixty and in genuine need of help. The amount of the pension is not fixed, and the scheme is administered by the communal councils, the expenses being divided between these bodies and the government. The system seems to be little more than an extension of out-relief, with the usual disqualifications attaching to poor-law relief, but, as with the German scheme, time alone can show whether the experiment will prove successful; and the results of both will be watched with great interest.

In *France* various proposals and suggestions have been made, and M. Méline has recently (October 1897) promised legislation on the subject, but his scheme has not advanced beyond the stage of political programmes, and no details have yet been given.

PENSIONS IN THE UNITED STATES.

The pension system of the United States had its origin in the revolutionary war in the half-pay provisions made for officers. Early in the war, under the advice of General Washington, provision was made that all commissioned officers who should serve throughout the war, take an oath of allegiance to the United States, and reside in the country, should receive half-pay for seven years after the close of the war, provided that they held no office of profit under the states. In 1780 the act was extended to the widows and orphans of those who died during the war; and in that same year the period of half-pay for life was changed to full pay for five years, the sums being paid in interest-bearing certificates that soon depreciated in value.

Besides this provision of the general government for officers, some of the states, notably

Pennsylvania, had made similar laws. In 1785 congress suggested that the states provide pensions for invalids; and three years later the United States agreed to give credit to the states "for such sums as may become due to invalids." In 1808 the central government finally assumed the pension obligations of the separate states.

The principle adopted was that all persons disabled in the service—whether regulars, volunteers, or militia men, soldiers or sailors, under the United States or the separate states—should be pensioned. Safeguards against fraud were made, and on the whole well maintained. In 1818 a demoralising measure was passed, giving pensions to all soldiers of the revolution "who, by reason of reduced circumstances, shall stand in need of assistance from their country for support," provided that they had served in the army at least nine months. Wholesale frauds followed. 27,948 persons applied for relief; over 18,000 claims were allowed. Men who had never served, men who deeded away their property in trust, or gave it to their children, were put on the list. Finally the expense and the abuse became so great that, in 1820, Congress passed a new law with stricter requirements for examination, which caused one-third of the new pensioners to be stricken from the rolls. Later laws produced more abuses, to which President Jackson in his message of 2nd December 1834 refers; but the chief evil came from the above-mentioned act of 1818, which had a very great pauperising effect, in addition to the unexpected burdens laid upon the treasury.

After the civil war, pension legislation repeats the history of the earlier times; but the number of pensioners is so much greater that the sums of money involved are enormous, and the danger of political corruption great. At first the general principle followed was that all, regardless of rank, "wounded or disabled while in actual service," should be cared for at the public expense. This principle was extended, naturally, to cover also those dependent on the soldier. The amount granted for total disability ranged from $8 to $30 per month, according to the official rank of the pensioner. Some acts were passed granting definite sums for specific injuries, and these were from time to time increased, *e.g.*:—

	Per month.
1864. For loss of both feet. . .	$20
1866. Loss of both feet or both hands, or sight of both eyes, or such disability from other causes as required the personal attendance of another person .	25
1872. This increased to . . .	31·25
1874. „ „ . . .	50
1878. „ „ . . .	72
1879. Those becoming totally blind from war causes . . .	72
1889. Those losing both hands .	100

Similar changes were made in other respects, as well as specific provisions for artificial limbs, trusses, etc.

January 25, 1879, the so-called "Arrears of Pensions" Bill became a law. This provided that pensions granted before or after the passage of the act should commence from the date of death or discharge from the army of the person on whose account the pension was granted. In many cases this added a round sum of hundreds or even of thousands of dollars to pensions lately granted. The prize was so great that within the next eighteen months more than 170,000 new claims were filed, and the expenditure for pensions leaped from some $33,000,000 annually to more than $60,000,000 within five years, with a steady increase to nearly $90,000,000 in 1889.

In 1890—largely probably as a result of political pressure and the fear of offending the old soldiers and their friends if the bill were not passed—the Dependent Pension Law went into effect. This provided that "all persons who had served . . . ninety days or more . . . and who were suffering from a mental or physical disability of a permanent character, not the result of their own vicious habits, which incapacitates them from earning a support by manual labour," were to be pensioned at from $8 to $12 a month, in proportion to the degree of their disability. The first commissioner of pensions after the passage of this act, by a very liberal ruling, included under it specific disabilities, and the "capacity of a claimant . . . to perform manual labour was no longer even considered in adjudicating his claim." The expenditures increased very rapidly. In 1892-93 the amount paid for pensions exclusive of office expenses was $156,740,467.14. For 1895 the total estimates, including surgeons' and agents' expenses, were $162,631,570.

A new commissioner of pensions in 1893, believing that many pensions had been illegally granted under the act of 27th June 1890, appointed a board of revision to examine the cases allowed under that act, and many fraudulent cases have been found and the pensions withdrawn. For the year ending 30th June 1896 the commissioner estimates the needed expenditure for pensions at $148,000,000.

Liberal as the United States have been in thus granting pensions, the demoralisation wrought by so many liberal acts and by the appeals of pension agents has led to a vigorous demand, which it is hardly likely will be granted, for a law granting a pension to every person who had been sixty days or more in military or naval service.

Besides the general laws, special laws by the thousands have been passed granting pensions to those not receiving them under the general acts, or increasing the sums allowed them. In

one day, 3rd March 1891, ninety-six such bills became laws.

Of late years ex-presidents' widows have been given pensions—first Mrs. Lincoln, then Mrs. Garfield, Mrs. Polk, Mrs. Tyler; and retired judges of the U.S. supreme court receive them. There has also been discussion of pensions for the life-saving service, railway mail clerks, etc. But the country has on the whole limited its pensions to those who have served in the army and navy. J. W. J.

PERAVY, De. See St. Péravy.

PERCEVAL, Spencer (1762-1812), English statesman and financier, was the second son of the second Earl of Egmont. He entered parliament for Northampton in 1796, and became a strong supporter of W. Pitt.

When Pitt succeeded Addington, Perceval, who had been solicitor-general to the latter, again accepted office as attorney-general. He declined to prosecute the members of the early trade-unions at the instance of the employers, on the ground that he was unwilling to commit the government to a uniform support of the employers on trade questions. He cordially supported Wilberforce's endeavours to remedy the abuses of the Guinea slave trade. Perceval devoted much attention to financial questions, and took a conspicuous part in the debates on the financial irregularities which led to Lord Melville's impeachment. On the death of Pitt (1806) he resigned; but he still took an active part in parliament.

In the Duke of Portland's ministry, formed 31st March 1807, Perceval became chancellor of the exchequer. After a dissolution the ministry returned greatly strengthened. He was successful with his first budget, and his scheme for the conversion of 3 per cent stock into terminable annuities was generally approved.

On the death of the Duke of Portland in 1809, Perceval became prime minister, retaining his old post of chancellor of the exchequer. The ministry was weak, and the times critical. Military and fiscal troubles followed on each other in quick succession. England was required to pay for the Spanish army in the Peninsular war, when she could scarcely pay for her own, and gold payments were demanded when gold was extremely scarce. Perceval struggled bravely against his difficulties, which were aggravated by a powerful opposition.

The budget demands in 1811 revealed the serious condition of the national finances. The chancellor's proposals included a grant of £2,100,000 for Portugal, and the ministry acceded to the recommendation of the select committee on commercial credit that £6,000,000 should be advanced to the manufacturers suffering from the over-speculation of previous years. When Horner proposed resolutions in favour of the resumption of cash payments, Perceval successfully resisted them. A bill was passed in July making bank-notes legal tender, avowedly because gold was so appreciated that for currency purposes it was unprocurable, while bank notes were worth only 80 per cent of their face value.

Though Perceval now appeared to be in a strong position, difficulties soon arose. His opposition to popular reforms greatly weakened his ministry, and his policy on the Orders in Council dealt it an almost fatal blow. The unwisdom of these orders had long been apparent, and it was contended that instead of injuring France they were rapidly destroying English commerce.

In the midst of his struggle against almost overwhelming odds, Perceval was assassinated by a deranged bankrupt named Bellingham, as he was entering the House of Commons on 11th May 1812. He was a man of stainless personal character, but narrow in his views and mediocre in his abilities. Nevertheless, he had a dogged persistency that carried him through crises which would have daunted abler men. As a financier he wanted originality, but framed his policy according to the dictates of expediency and opportunism.

[Alison, *Europe.*—Spencer Walpole, *Life of Perceval.—Dictionary of National Biography*, vol. xliv.—Jesse's *Memoirs of George III.*—Massey's *History of England.*—The Duke of Buckingham's *Memoirs of the Regency.*] G. B. S.

PERDIGUIER, Agricol (1805-1875), originally a working man, was elected a representative to the French national assembly of 1848.

He wrote three books on French *Compagnonnages*, or local groups called *Devoirs*, of itinerant artizans confederated by crafts into general associations covering the whole of the country—many groups had in secret survived their abolition by law in 1791. The principal is the *Livre du compagnonnage* (1837), in which he gives their history, disentangled from several rather mythical stories as to their origin, describes the local institutions with their ceremonies and pass-words, and entreats them to stand firmly together—warning them against some abuses which had sprung up in the course of time. He also wrote *Une scission dans le Compagnonnage* (1846), and *La question vitale du Compagnonnage* (1861). Perdiguier was intelligent and clear-headed, deservedly esteemed by his fellow working-men. E. Ca.

PEREIRA, Gregorio Pietro (18th century). Was a priest of Portuguese extraction. He wrote a treatise on money and commerce, read at the academy of Ravenna, 1757.

He follows the theories of Melon and shows the influence of Pufendorf and Locke. He accepts Locke's idea of money and his theorem that the amount of metal in a coin alone constitutes the measure of its value. He shows the disadvantages produced by monetary alterations, and examines the means possessed by

states for increasing gold and silver and concludes that these are conquest and commerce.

He advocates the maintenance of a favourable BALANCE OF TRADE (*q.v.*), and places this in the predominance of exports over imports, the development of the navy, agricultural industry and manufacture, and the increase of national products.

Dissertazione sopra la giusta valuta della moneta e la necessità del commercio per arricchire gli stati. Faenza, 1757.

[Graziani, *Le idee economiche degli scrittori emiliani e romagnoli, etc.* Modena, 1893.] U. R.

PEREIRE, ÉMILE (1800-1875), was in his youth one of the most devoted of the St. Simonians (see ENFANTIN; ST. SIMON), and a contributor to their journal, the *Globe*. He also wrote in the *National* and the *Revue Encyclopédique*. After the dispersion of the St. Simonian school, he, like most of its members, showed himself a very enterprising and active business man. With the co-operation of his brother, Isaac PEREIRE (*q.v.*), also earlier in life a St. Simonian, he constructed the first line of railway in France, between Paris and Saint Germain, and later contracted for the main lines of the *Compagnie des Chemins de Fer du Nord*. In 1852 the two brothers jointly founded the *Société Générale du Crédit Mobilier*, which gave a wonderful impulse to great financial and industrial enterprises both in France and elsewhere.

Émile Pereire published in separate form:—*Examen du Budget de 1832. Réformes financières . . . moyen de supprimer les impôts du sel, des boissons, du tabac et la loterie* (1831).—*De l'assiette de l'impôt; examen critique de travail de la Commission de la Chambre des Députés sur le budget des recettes* (1832).—*Considérations sur les Finances de la France et des États Unis* (1832). These belong to his St. Simonian days, and are republished from the *Revue Encyclopédique*.

[G. Weill, *L'École St. Simonienne*, 1896.]

PERI, GIOVANNI DOMENICO, a rich and learned merchant of the first half of the 17th century, desired, as he says in his preface, "to communicate to the world some collections about the establishment and maintenance of his business," which were originally intended for his sons Girolamo and Tomaso, successors to their father's business.

These collections he printed in his *Negoziante*, a work which, however, has much wider aims than the author would lead us to believe. It is a technical handbook for merchants, to teach them trading and book-keeping, treating at much length of the method of mercantile accounts called the system of double entry. It contains also interesting historical notices on the exchanges between the principal Italian and foreign cities, explained in twenty statements in the second part. Following the impulse given to comparatively liberal opinions in public economy and commerce, as by SCACCIA, STRACCA, and other followers of commercialist doctrines, Peri demonstrates the importance of merchants, and pleads for them and commerce. He treats also of mercantile contracts, giving all the necessary explanations for entering into them conformably with the ideas of the jurisconsults of his epoch. The work is divided into four parts, and is still interesting, especially for the history of the mercantile customs of those times.

Il negoziante, Genoa, 1638, and Venice, 1672, parts i. and ii.; 1673, parts iii. and iv., presso Gio. Giacomo Herz. A. B.

PERICULUM SORTIS. This term is used by mediæval writers on usury to describe the danger on the score of risk to which a man might expose himself by lending money. Although usury and interest, in the modern sense of the term, were forbidden, exceptions to and evasions of the strict letter of the law became increasingly common; among others we find payment widely taken on the ground of *periculum sortis* in cases where an individual incurred a distinct risk of losing his loan altogether; or, where he was inconvenienced by the failure of a borrower to return it at the stipulated time.

[Ashley, W. J., *Introduction to English Economic History*, i. (1892).—Cunningham, W., *Christian Opinion on Usury* (1884).—Cunningham, W., *Growth of English History and Commerce* (1890).]

E. A. M.

PÉRIER, CASIMIR (1777-1832). Originally an engineer officer, he left the army in 1802 to found a bank. Under the government of the Bourbons, he was in the Lower House, and a steady opponent of the reactionary measures passed during their reigns; after the revolution of 1830 he became minister of the interior, and held this post at the time of his death.

His *Réflexions sur le projet d'emprunt* (1817), and his *Opinion sur le projet de loi relatif au remboursement et à la réduction des rentes* (1824), were directed against foreign loans and the conversion of state loans. In 1838, a collection of his speeches was published under the title of *Opinions et Discours de M. Casimir Périer* (4 vols.) with a prefatory notice by M. de Rémusat.

E. Ca.

PERIODICITY OF CRISES. See CRISES.

PERIOT (or PERIT). A fractional part of the troy grain formerly used in calculating the value of the precious metals, but not actually existent as a weight. Taking the standard troy pound as a unit, the subdivisions were as follows:—

1	Troy pound	=	12 ounces
1	,, ounce	=	20 pennyweights
1	,, pennyweight	=	24 grains
1	,, grain	=	20 mites
1	,, mite	=	24 droites
1	,, droite	=	20 periots
1	,, periot	=	24 blanks

The periot, therefore, was equal to $\frac{1}{9600}$th grain, and the smallest subdivision, the blank, to $\frac{1}{230400}$th grain. As no weight less than about $\frac{1}{2000}$th grain is appreciable on a good assay balance of the present day, it is evident that no such weights as the above could actually exist, and there can be little doubt that they were used in calculating the value of bullion in bulk in the same manner as we now use decimals. Thus the schedule to the Coinage Act 1870 gives the weight of a sovereign as 123·27447 grains, but if the weight be calculated from the data given in the note to the schedule (934 sovereigns and one half-sovereign in a pound troy of standard gold), it is seen that this is only an approximation, the exact weight being indeterminate (see GUINEA), and, where minute accuracy is aimed at, the number of decimal figures used will depend on the multiple of the sovereign under consideration.

It is not possible to state precisely when these weights were first introduced, or when their use was discontinued, but they are referred to in an old manuscript volume in the Royal Mint library, entitled *Mint and Moneta*, which bears no date, but appears to have been written during the latter half of the 16th century, as "only used by the goldsmiths for the making of an assay of gold and silver." They are also used in an act of Queen Elizabeth (43 Eliz. 1601) in defining the weights of silver coins, and for a similar purpose in regard to both gold and silver coins in an act of the Long Parliament (see Scobell's continuation of Pulton's *Acts and Ordinances*, 1640-57, under date 1649 c. 43, *Moneys and Coins of England*). References will be found to them also in various modern text-books (Chaffer's *Hall-Marks on Plate;* Kelly's *Universal Cambist;* Ruding's *Annals of the Coinage;* Chaney's *Our Weights and Measures.* It is interesting to note that three of the names used for these subdivisions of a grain are those of ancient coins; also that they are alternately one twentieth and one twenty-fourth, as in the case of the ounce, pennyweight, and grain at the present day. E. R.

PERMIT, a license or writing granted by the officers of the excise certifying that the duties on certain goods have been paid, and authorising or permitting their removal from one place to another. Previous to 1848 all spirits sent out by spirit dealers were accompanied by permits, but by the 11 & 12 Vict. c. 121, an excise certificate was substituted for the permit. This provision was extended to the removal of spirits by rectifiers and compounders by the 23 & 24 Vict. c. 114.

The use of permits is at present restricted chiefly to the removal of duty-free malt and of spirits from distillers' spirit stores or from duty-free warehouses.

Permits and certificates are regarded as a valuable means of identifying articles on transit, and of distinguishing those upon which the duties have been paid from those upon which duties have not been paid. They also afford a means for checking the receipt of illicit spirits, and of preventing a fraud on the revenue laws.

PERPETUITIES, RULE AGAINST. The rule against perpetuities is intended to prevent the tying up of land or other property for an indefinite period. The love of power, and the wish to perpetuate the opulence and consideration of their families, has often induced owners of property, especially of landed property, to settle beforehand its devolution for as long a time as possible. But the English courts of justice have always endeavoured to limit this action in the public interest and to maintain freedom of trade in property. When the landowners procured the statute *De Donis Conditionalibus*, 13 Edw. I. c. 1, which made entailed land inalienable, the courts evaded the statute by means of the collusive actions known as fines and recoveries. When the Statute of Uses, 27 Hen. VIII. c. 10, contrary to the intention of those who enacted it, made possible new contrivances for guiding the devolution of landed estate, the courts again took alarm, and by degrees worked out what is now known as the rule against perpetuities. Under this rule, any disposition of landed estate, or other property, which is to be valid, must take effect within the period of a life, or lives, in being at the time when it was made, and twenty-one years afterwards, with an additional allowance for the period of gestation where the party entitled is a posthumous son. The practical importance of this rule, as ensuring the restoration of land sooner or later to free commerce, is vastly diminished by the fact that every tenant for life has now a statutory power of selling the settled land (see SETTLEMENT, LAND; ENTAIL, LAW OF).

In connection with the rule against perpetuities may be noticed the rule limiting the period during which the income of property, real or personal, may be accumulated for the benefit of the person or persons who will ultimately take that property. The rule is contained in the act 39 & 40 Geo. III. 98, popularly known as the Thellusson Act. A certain Mr. Thellusson had ordered in his will that the income of his estate should be accumulated during the lives of all his children and grandchildren alive at the time of his death for the benefit of some future descendants. Such a disposition did not contravene the rule against perpetuities, but it was felt to be unreasonable and contrary to public policy. It thus led to the passing of the act

above mentioned, which forbids the accumulation of the income of property for any period longer than the life of the grantor, and twenty-one years afterwards, with an allowance for the period of gestation where the person who is to take is still unborn at the death of the testator. Any direction to accumulate income, which contravenes the act, is void for the time in excess of the period prescribed by the act. The income during such time is to be paid to the person who would have been entitled to receive it had there been no direction to accumulate. A further check on the accumulation of income for the purpose of purchasing land is imposed by the Accumulation Act 1892 (55 & 56 Vict. c. 58). (See THELLUSSON.)

[Williams, *Principles of the Law of Real Property*, and *Principles of the Law of Personal Property*, and Lewis on *Perpetuities*.] F. C. M.

PERSONAL PROPERTY. Personal property is, roughly speaking, movable property; as real property is, roughly speaking, property in land. It consisted originally of movables or chattels in the strict sense, but its scope was afterwards extended. Certain interests in land which were of little consequence at the time when the definition of real estate became fixed, are described as *chattels real*, and treated as personalty. These include all leasehold interests and estates at will. Again, the right to enforce payment of a debt or to recover damages in an action at law are included in personalty under the name of *choses in action*. Personal annuities, money invested in the funds, the shares of most companies, patents and copyrights, are described as incorporeal personal property. Indeed many objects now included in personal property have hardly anything in common save that on the death of the person entitled to them, they pass to the executor or administrator, whilst realty before 1898 passed to the heir or devisee.

[Williams *on Personal Property*.] F. C. M.

PERSONAL SERVICES are those which are expended in guarding, conveying, or otherwise preserving (*a*) the objects of production; (*b*) the persons of the producers. These services may be, as SISMONDI observes (*Nouv. Princ. de l'Écon. Pol.*, p. 147), "of the most elevated as of the most menial kind . . . as for instance those of a physician . . . or those of a *valet de chambre*."

Economists differ as to whether the possession of such services may be rightly esteemed wealth, and as to whether those who render them should be styled productive or unproductive labourers. Adam Smith observes that "the labour of a menial servant . . . adds to the value of nothing" (*Wealth of Nations*, edited by M'Culloch, p. 149). J. S. Mill, following his lead, writes of "domestic servants and all other unproductive labourers" (*Principles of Pol. Econ.*, ch. iii.), and sharply criticises M'Culloch and J. B. Say for classing them as "productive." Again, in his *Some Unsettled Questions of Political Economy* (Essay iii.), Mill distinctly repudiates the idea of domestic servants being productive labourers, yet, inconsistently, admits (cp. also Sismondi, *Nouv. Princ.*, p. 147) that most of such persons "occasionally, and some habitually, render services which must be considered as of a productive nature" (p. 85 *ib.*).

The French economists of the present century opposed both Smith and Mill. Thus J. B. SAY, referring to the consumption of wealth, observes that the most rapid consumption is that made *des services personnels* (*L'Écon. Pol.*, ii. p. 231; also quoted by Sandelin, *Répertoire Gén. d'Écon. Pol.*, art. "Consommation"). Sismondi thought them productive, yet he makes the confusing remark that "they only differ from productive labour in the fact that their results cannot be stored up" (*ib.* p. 147).

F. BASTIAT argued against both Smith's and Mill's reasoning. In his chapter on value, he examines the nature of a "service," laying stress on Say's doctrine—as old as Bacon—that there is really no such thing as creative or so-called "productive" human labour. Man can only combine or displace the forces and materials which already exist. It follows from this that all labour being equally "unproductive," the importance of any service is only a question of degree. Bastiat considers the services of soldiers, guards, etc., as "undoubtedly" "productive," "seeing that the sole object of the arrangement is to increase the proportion which the aggregate satisfactions of the community bear to the general efforts" (p. 146 *ib.*). He proceeds to argue that personal services have "value" quite independently of their transiency, and referring to those services which "vanish and leave no trace behind," he remarks: "The very same thing holds of personal services. The consumer makes the value disappear, for it has been created only for that purpose. It is of little consequence, as regards the principle of value, whether the service is undertaken to satisfy a want to-day, to-morrow, or a year hence."

Modern English economists have not all agreed with Bastiat. Prof. Alfred Marshall is, however, very decided on the question. Defining wealth as consisting of the desirable things a man possesses, he confines the term to a man's "external goods," but he extends this to include "personal services of all kinds" (*Principles of Pol. Econ.*, p. 106). Prof. J. E. CAIRNES (*Some Leading Principles of Pol. Econ.*, p. 25) brackets commodities and services interchangeably as wealth; but Prof. H. Sidgwick (*Principles of Pol. Econ.*, bk. i. ch. iii. p. 78), going back to Smith's definition of wealth, places both sides of the question with almost equal force before his readers. "A man's money," he observes, "is not entirely . . . spent in consumable things . . . it is partly spent in what we may call 'consumable services,' *i.e.* utilities furnished

by the labour of others, 'which are not fixed and embodied in matter,' such as the services of domestics, physicians, actors, carriers. Ought we then to extend the conception of 'wealth' to include such services." . . . "If, as I think, the term wealth is by usage restricted to stores or sources of utility comparatively permanent, some other term must be found to include . . . what I have called directly 'consumable services,' . . . and I propose . . . to employ the terms 'commodities' and 'produce of labour' in this extended way." Prof. Sidgwick then goes on to raise the question which Bastiat discussed, and assumes that personal services "are not wealth, on account of their transiency" (*ib.* p. 79). Prof. Marshall (*Principles of Economics*, 1st ed. p. 110) observes that the inclusion of these does not often affect our discussions except in cases where there is a distinction between what is "wealth to the individual," and 'wealth to the society."

It is, however, obvious that the personal services of what Sismondi happily calls *cette population gardienne* (*ib.* p. 141) are absolutely and directly indispensable to the production, the transfer, the circulation, and what is equally important, the protection and preservation, of wealth, and must therefore be classed as indirectly productive labour. A. L.

PESCATORE, MATTEO (1813-1879), was born at San Giorgio Canavese (Piedmont). He first taught civil law and then the philosophy of law at the university of Turin. He was a deputy in the sub-alpine parliament, and when the kingdom of Italy was constituted he became one of its senators. Deeply versed in judicial and social science, his work has left traces on education, legislation, science, finance, and the philosophy of law. In the teaching of law Pescatore introduced a rational, in place of an exegetical method. The law on the enfranchisement of long leases is due to his labours and work in parliament.

He left two important works, one on legal philosophy, *Logica del diritto*, the other on finance, *Logica delle imposte*. Turin, 1867. The latter is a comprehensive treatise on taxes, and displays thorough practical sense combined with incisive and original ideas as well as profound learning.

[A. Bertolotti, "Matteo Pescatore," in the *Rivista Europea*, Florence, 1879.] U. R.

PESETA—a diminutive of PESO, which was frequently used to denote the Spanish dollar—first appears amongst Spanish coinage terms during the 17th century. It was then, however, rarely used. It was a division of the dollar, and was applied to two different moneys of account, distinguished as

PESETA MEXICANA, which = 5 reals vellon,

PESETA PROVINCIAL, which = 4 reals vellon.

The coin representing this latter denomination, usually called the PISTAREEN, was from 1700 onwards a familiar term in commerce, particularly in the West Indies; five of them went to the dollar, and they were, in 1717, valued by Sir Isaac Newton as 10$\frac{2}{3}$d. of English currency.

When, in 1876, Spain actually adopted the method and standard of the Latin union, she took the peseta provincial, which was roughly equal to the franc in value, as the unit of the new currency, and divided it into 100 centimos, to correspond with the French centime. The silver 5-peseta piece, like the 5-franc piece of France, became the largest silver coin, and the gold 25-peseta piece was the representative of the existence of a gold standard. But, owing to the absence from Spain of a sufficient stock of gold to keep the 5-peseta piece at its proper value, the peseta has been steadily falling in gold price for some years past, and at the present time (1907), instead of 25·22, about 35 are required in exchange for a sovereign.

PESO. See DOLLAR, MEXICAN, etc.

PESSIMISM. Like the term OPTIMISM, the term pessimism is used in a variety of senses. Properly it denotes the doctrine that, in the world as a whole, evil necessarily predominates over good. But it is often used loosely to describe the mood of those who are more alive to the evil than to the good of existence. Quite apart from any philosophic theory, differences of temperament and of circumstances will cause men to differ very widely in their estimate of life. Individual feeling admits of infinite gradations which defy classification. Pessimism and optimism in this popular use are terms of merely relative import. Pessimism as a principle has manifested itself in religious forms, notably in Buddhism, and in philosophical forms, the most modern of which are associated with the names of Schopenhauer and Hartmann. A critical examination of pessimist theories would altogether transcend the limits of this article. They have their origin in the undeniable and awful contrast between human aspiration and human attainment. No form of philosophic pessimism has at present exerted much influence on political economy. The CLASSICAL ECONOMISTS (*q.v.*) lived in an age of optimism and were in full sympathy with their age. They had a hearty faith in the unfettered energies of mankind. It is true that the theories of certain eminent economists, as MALTHUS and RICARDO, have been used to demonstrate that under existing conditions the state of the mass of mankind must steadily grow worse. The inference commonly drawn, however, was not that mankind were doomed by fate to suffer, but that the actual economic

system must be modified. Those who do not expect well-being to result from individual effort are confident that it can be produced by the action of the community.

The rising generation of economists may probably be less optimistic in tone. The very diffusion and intensity of the desire for comfort tend to produce a formidable discontent which may at first discharge itself upon obnoxious institutions or classes, but must finally break against the unalterable facts of nature. Certain characteristics of modern civilisation, notably the resulting prolongation of the lives of the weak, both in mind and body, and the heavy burthens imposed on the capable members of society, seem likely to retard progress as hitherto understood. The limits to the physical resources of our globe are becoming more apparent. Nearly the whole of its surface has been explored; the area which civilised man can occupy has been pretty well ascertained; the great forests are disappearing, the virgin soils are losing their spontaneous fertility, and mines are worked upon a scale which in many cases threatens exhaustion in no distant future (MINES AND MINERALS, EXHAUSTION OF). The assumption that mankind are destined to a practically infinite economic development is thus shaken. The economists of a past age were chiefly concerned with the advantages which would follow the destruction of artificial barriers; but the stringency of natural limitations which cannot be removed will probably attract more attention from the economists of the approaching time.

[J. Sully, *Pessimism, A History and a Criticism.*—W. Wallace, article on "Pessimism" in the *Encyclopædia Britannica*, and the authorities therein cited.] F. C. M.

PESTEL, FRIEDRICH WILHELM VON (1724-1805), was born at Rintelen (Lippe-Schaumburg), studied at Göttingen, became doctor *utriusque juris* (1747), and professor of law, first at Göttingen and afterwards (1763) at Leyden. He was dismissed from his office in 1795, when the revolution broke out; and then went to Germany, but returned in 1803 and remained at Leyden until his death. In 1792 he was ennobled by the Emperor.

His works mostly deal with law; the following, however, contain parts which are important in connection with economic study; *Gedanken von der Rechtmässigkeit der Reichsständischen Landposten und der Unerweislichkeit eines diese ausschliessenden fürstlichen Taxischen Reichspostmonopols* (Thoughts on the lawfulness of the posts managed by the different governments of the empire and the absence of evidence for the monopoly of the posts enjoyed by the Prince of Taxis), Rintelen, 1759.—*Fundamenta jurisprudentiae naturalis delineata in usum auditorum, L.B.* 1773, 1774, Ultraj, 1776, translated into French (1775) and into Dutch (1783).—*Commentarii de Republica Batav., L.B.*, 1782 and 1798. The last work especially contains some remarks on trade and currency that deserve mention; they bear, however, for the greater part, the impress of the opinions of his time; the general ideas are mostly imbued with a moral and philosophical character. A. F. V. L.

PETER'S PENCE, called also Rome Scot. An annual payment made to the pope of Rome till the reign of Henry VIII. Its origin is almost lost in antiquity, but tradition says that it was instituted by Offa, king of Mercia, who, after a visit to Rome, ordered that every person having land or cattle of the annual value of 30d. should contribute a penny annually towards the support of the English college at Rome, the whole to be collected each year during the time between the feast of St. Peter and St. Paul and the first of August. Before the beginning of the 13th century Peter's Pence had been commuted for a fixed annual payment, about £200. Even this soon came to be looked upon as a papal exaction, rather than a free gift, and the threat of withholding it was a valuable weapon against papal aggression: when therefore in 1305 A.D. Clement V. tried to go back to the old system of a penny from each household, the attempt was stoutly resisted, and it was never again repeated. The term is still used as describing voluntary payments made to the Pope. The payment of Peter's Pence as a national gift was abolished in 1533 by 25 Henry VIII., c. 21.

PETIT SERJEANTY. See SERJEANTY.

PETITTI DI RORETO, CARLO ILARIONE (1790-1850). Born in Turin of a noble family, he held important offices under the Piedmontese government, and occupied himself much with the duties of administration and economic study, discussing and proposing important liberal reforms in the state, and exercising a useful influence.

His principal work, on the best manner of dealing with beggars, will bear comparison with DE GERANDO's classic. In this book Petitti discussed the precautions taken to prevent begging in different states, and the question of legal intervention. Another work on Italian railways, in which he studied the organisation of railways thoroughly, giving many useful statistics, was of great importance in Italy, as the first example of this kind of investigation at a time when great industrial questions were still not familiar in that country.

Petitti wrote also on prison discipline (Turin, 1840), on children's labour (1841), customs unions (1844), reform in taxation (1844), and on many other subjects.

After his death another of his works was published, on the subject of the lottery. In this are collected facts from different countries, their laws on the subject, and the history of the different systems; he attacks government lotteries with much force. *Sul buon governo della mendi-*

città, Turin, 1837.—*Delle strade ferrate e del migliore ordinamento di esse*, Capolago, 1845.—*Del giuoco del lotto*, Turin, 1853.

[P. S. Mancini, *Notizia della vita e degli studj di C. I. Petitti di Roreto*, publicata come proemio all' opera postuma di questo sul giuoco del lotto.] U. R.

PETTY BAG, *Parva Baga*, was a division of the chancery records which was concerned with writs and returns in cases more nearly affecting the interests of the crown than those of the subject. These records date from the Tudor period, and include writs and returns of *Certiorari*, *Ad quod Dampnum*, *Depopulations* and *Scire Facias*, etc. These might be classed as the political records of the chancery, that is, in so far as they refer to questions of state or public policy. The division, however, is very loosely made, and is not consistently observed.

For economic purposes these records are interesting as containing valuable and instructive returns of "Depopulations" under Elizabeth and James I. A. L.

PETTY, Sir William (1623-1687), political economist and statistician, born at Romsey in Hampshire, was educated to be a doctor, and graduated, 1649, in physic at the University of Oxford, subsequently at the College of Physicians in London. His active life may be divided into two periods. During the first, after a short tenure of the professorship of surgery at Oxford, he held several public appointments in Ireland, in connection with the survey of that kingdom and the subsequent distribution of the confiscated lands amongst the successful soldiery, after the conquest of the island by the Commonwealth. Petty enjoyed the confidence of the Cromwell family in a singular degree, and remained devoted to their memory to the last. In the second part of his career, after the overthrow of the Protectorate by the Republicans, and of the Republic by the Restoration, he devoted himself to the study of vital statistics and questions of trade and commerce, to which he gave the name of "political arithmetick" (see Arithmetic, Political). He enjoyed the good-will and protection of the king personally, though he was the object of dislike of the extreme court party, as he had been of that of the extreme republicans.

"By political arithmetick," says Davenant, "we mean the art of reasoning by figures upon things relating to government. . . . The art itself is undoubtedly very ancient; but the application of it to the particular objects of trade and revenue is what Sir William Petty first began. . . . He first gave it that name, and brought it into rules and methods" (Davenant, *Political Arithmetick*, Works, 1, 128, 129). In this sense Sir William Petty has, and not without reason, been called the founder of political economy.

Putting aside the works relating to the history of the Down survey, which are of exclusively historical interest, the first publication with which the name of Petty is connected is *The Observations upon the Bills of Mortality* of the city of London, published in 1662; a small book of about 100 pages, but bearing on the title-page the name, not of Petty, but of Graunt (*q.v.*). Whether Petty or Graunt was the real author has been the subject of much controversy. It is to be noticed that in a list of his writings—though not of his published works—found at Wycombe in his own handwriting, some "observations on the bills of mortality" are mentioned under the date of 1660, *i.e.* two years before the appearance of Graunt's pamphlet (*Life of Petty*, p. 318). It is not, however, stated that these observations were then published. On the other hand, in one of the two series of detached essays on "political arithmetic," published at various times between 1671 and 1687, Petty speaks distinctly of the earlier work as "Grant's book"; and in another he refers to his own essay the "Observations upon the Dublin bills" as the "'snuffers' to make the candle of the new light to the world given by the earlier book burn clearer."

Taking this list of facts into connection with the publication by Petty, in 1674, two years after Graunt's death, of a new and enlarged edition of the book, with the numerous parallelisms between the *Observations* and the *Treatise on Taxes*, published by Petty in 1662, with the general belief at the time, as evidenced by Evelyn and Burnet, that Petty was the author, and with the intimacy over a long period of Petty with Graunt, it can hardly be doubted that Petty had, to say the least, a large share in the work, and that the case is one of joint authorship[1] (*Life of Petty*, p. 180).
